The Ontario Provincial Pharmaceutical Association met in Toronto, February 9. The following officers were elected for the ensuing year: President, L. W. Yeomans, Belleville; vice presidents, H. Watters, Ottawa; J. W. Gerrie, Hamilton; N. A. Bosworth, Stratford; secretary, G. A. McCann, Toronto; treasurer, H. Sherris, Toronto. The regular semi-annual meeting of the Council of the Ontario College of Pharmacy was held on the same day. The financial statement shows a net gain in the assets for the past three years of \$10,809.27, the total assets over liabilities being \$7,183.76. One of the questions of interest discussed was the recognition of the New York College of Pharmacy diplomas. The resignation of Mr. Jordan, of Goderich, as a member of the council was accepted.

The Monroe County (N. Y.) Pharmaceutical Association held its first annual banquet January 3 in Rochester. Sixty-five members of the association attended. A. H. Dewey, president of the association, acted as toastmaster. A letter of regret from Mayor Curran, who was to have responded to the toast, "Advantages of Organization," was read, and in his absence George J. John responded to the toast. Other toasts were responded to as follows: "New York State Board of Pharmacy," Mr. Haskins; "The German Pharmacist," in the vernacular of the Fatherland, Mr. Wagner; "The Druggist of Fifty Years Ago," Dr. Meyers; "Monroe County Pharmaceutical Association," Louis Wyeth; "Essence of Common Sense," Louis A. McGraw. Dr. Meyers, who spoke on "The Druggist of Fifty Years Ago," is 91 years of age, and was one of the first druggists in Rochester. The officers of the association are: A. H. Dewey, president; Lewis Wyeth, vice-president; A. R. Manning, secretary, and J. J. C. Curtis, treasurer.

The Connecticut Pharmaceutical Association, which has a membership of three hundred, held its annual convention in Hartford, February 6 and 7. Extended obituary reports were made in regard to Stephen Goodrich and other members of the association who have died during the year. The election of officers resulted as follows: President, James Duggan, of Norwich; first vice-president, A. Felton Wood, of New Haven; second vice-president, C. P. Gladding, of Hartford; secretary, F. Wilcox, of Waterbury, and treasurer, Lester H. Goodwin, of Hartford. The association selected the names of six persons to submit to the Governor of the state from which to select a member of the pharmacy commission. At one of the sessions Henry Canning, of Boston, president of the Interstate Retail Druggists' League, spoke in relation to the work of the league and the objects to be secured by such an association. George W. Cobb, of Boston, of the Apothecary Guild, spoke of the necessity of some organization among the retailers and the adoption of a schedule of prices. It was voted to hold the next meeting at Norwich.

COLLEGES OF PHARMACY.

The Massachusetts College of Pharmacy Alumni Association have made arrangements for an entertainment to be held at the college building the evening of March 13th, to which the members of the class of '94, with ladies, are invited.

The Minnesota University pharmacy students have elected the following class officers: Senior class—President, Alfred B. Hart; vice-president, Walter R. Lienau; secretary, Miller T. Bolton; treasurer, Bernard O. Leubner. Junior class—President, Chas. L. Chapple; vice-president, Theo. Cook; secretary, Miss Alice Houlton; treasurer, A. H. Hillard. Nearly every one of the twenty-eight students is a high school graduate.

The Louisville College of Pharmacy commencement occurred February 3 at Macaulay's Theater. The names of the graduates in the order of merit are as follows: Selby S. Coleman, James G. Epsy, Charles R. Odewahn, Alphonse R. Bizot, J. F. Buschmeyer, Dunning A. Wilson, W. L. Wolf, J. A. Constantine, John G. Schanz, J. Aud McCarty, J. L. Ames, John R. Baird, Jr., Charles Manemann, Fred. P. Herr, Horace O'Hurley, W. G. Pfeiderer, B. A. Kruse, Orville H. Browning, Walter W. Vogt, Charles A. Buzan, G. G. Laufer and J. R. Montgomery.

The salutatory was delivered by J. B. Wood, of the junior class, and the valedictorian by J. Aud McCarty.

Dr. Albert Muench, of the Alumni Association, distributed the alumni prizes, and Gordon L. Curry, Ph. G., delivered the alumni address.

The graduating class was given a reception in the evening.

NEW YORK COLLEGE OF PHARMACY.

Emil F. Imhof, who has been secretary of the senior class, has resigned that office. He found the duties of the position required so much time that his studies had to suffer, so he preferred to relinquish the office.

The students are anxiously watching for the next issue of the Alumni Journal.

That first issue was such a good one that many of the boys expressed the hope of success for the publication.

Henry Fendler has given up his intention of becoming a prize man. This sudden resolution on his part is thought to be due to the time spent in trying to prepare a bill for the legislature regulating the druggists' hours of labor.

The juniors have quite an easy time of it now. Only chemical laboratory and pharmacy are left.

There is only one young lady in the senior class this year.

The seniors are now especially fortunate in having such excellent teachers as Prof. Rusby and Prof. Coblenz, who give personal attention to the "quizzes." This makes it very interesting for the boys, for these professors are the ones who make out the final examination papers, and the students are thus enabled to get used to their ways of questioning.

Prof. Coblenz has promised, if possible, to take the seniors over to Jersey City to witness the manufacture of essential oils.

There are representatives of a great many nationalities in the senior class, among them men from Russia, Norway, Turkey, France, England, Canada and the West Indies.

The seniors have their new class pin. It is of shield form, with "N. Y. C. of P. Class of '94" and the twisted serpent in gold on a brown enamel background. The cost of the pin is \$2.75.

One student says there seem to be fewer students out in the pharmacies this year than last.

MICHIGAN UNIVERSITY NOTES.

We are glad to announce that Prof. Stevens has sufficiently recovered from his recent illness to be able to resume his duties in the pharmacy department. He has been confined to his house for nearly four weeks with a severe attack of gripe, which at one time threatened to lead into pneumonia. We sincerely hope his recovery is a permanent one.

S. R. Boyce, Ph. C. '90, instructor in pharmacy and pharmacognosy in the department of pharmacy, Kansas University, has obtained leave of absence for one year and is pursuing post graduate work in this school. He leaves for Kansas about the 25th of September to resume his work in the university.

We owe a debt of gratitude to Miss Myrta H. Kempf, of Montgomery, Alabama, who so kindly presented to the pharmacy museum excellent specimens of the leaves, fruit and seeds of the cotton plant and a block of cottonseed cake from which the oil had been expressed. The arrival of the specimens at once suggested the means for dressing a window that would be a pleasant change from the time-honored stock displays, yet would at once be attractive, interesting and highly instructive. One entire window might profitably be devoted to the exhibition and description of the cotton plant and the various commercial, medicinal and food products obtained from its organs. Arrange the blows, as they are popularly called, in a tasty manner and accompany them with a neatly lettered statement descriptive of the fruit and its contents. Mention the fact that the filamentous appendages (called coma) which are attached to the entire surface of the seed, and which aid in its dispersion by the wind, form the cotton of commerce. Then

again, display a liberal quantity of the naked seeds and call attention to the early methods of separating the cotton, compared with the present rapid separation by Whitney's Cotton Gin. Place side by side bottles of cottonseed and Italian olive (7) oil, and mention that large quantities of the former are exported to Italy only to return as genuine Italian olive oil. An excellent opportunity for giving an object lesson upon the purchase of pure salad oil thus presents itself. It might be considered well to extend the scope of the display to include butter and lard substitutes and cottonseed oil soaps. Highly magnified drawings of the structure of the cotton and the wool fibres would certainly attract popular interest. Then, there is the cotton root bark, together with its pharmaceutical preparations to complete the exhibit. The general effect of the whole will be greatly improved by generous drapings and settings of ordinary and absorbent cotton and cotton dressings. To be sure, some expense and trouble would be incurred, but it would form a part of a system of legitimate advertising that would reflect credit upon the pharmacist and the profession.

A representative collection of organic chemicals known as Dr. Witte's Collection for Colleges, embracing two hundred important organic products of the aromatic series, has been donated to the School of Pharmacy. This collection was offered for sale at the close of the Columbian Exposition, and through the public spirit of Chicago alumni of the School, was purchased for this destination. The University is indebted firstly to I. Giles Lewis, of the drug house of Robt. Stevenson & Co., of 92 Lake street, Chicago, for putting through this purchase. Mr. Lewis was one of the very earliest students of chemistry and pharmacy in the University, and is one of the most spirited of the alumni. The specimens are contained in glass-stoppered bottles on foot, neatly capped and mounted in trays of uniform appearance, thus giving to the whole a decidedly pleasing effect.

The second Friday in February of each year marks a period of great mental activity and anxiety for the student and increased labor for the teacher. Four and one-half months of hard work is crowned by examinations which are the practical tests that determine the fitness of the student to further pursue his study. Now that the semester is closed, those that have safely run the gauntlet look forward to the work with great pleasure. The senior pharmacy students continue the study of pharmacognosy and pharmacology through the remainder of the year, and take in addition, lectures and demonstrations (together with daily laboratory practice) in organic analysis under the direction of Prof. Gomborg. Prescription work in the class-room and behind the counter will receive their daily attention under Prof. Stevens' supervision. Subjects are already being selected in order to afford ample time for library reading. The juniors are at present engaged in weighing and wrapping all the drugs required by them in the manufacture of pharmaceutical preparations which will occupy their entire time every afternoon during the semester. Their mornings are entirely devoted to microscopical botany (lectures and laboratory work) pharmacy lectures and physics.

CORRESPONDENCE.

We accept no responsibility for the views and utterances of our correspondents. Contributions must carry full name and address of the writers, which, however, will not be published, if so requested. Copy should reach us ten days in advance of date of issue.

APPRENTICES IN ENGLAND.

To the Editor.—Referring to the address of Mr. Martin, of London, upon the state of pharmacy in the United States, which appeared in your column, and the various subsequent comments thereon, I can perhaps give some additional information upon the subject to your readers. Your last issue contained a fairly accurate account of the compulsory examinations, viz., the Preliminary and Minor, the passing of which entitles one to practice pharmacy in England and Scotland. Ireland has a separate law with which I am not familiar. But a valuable feature of the English practice (not law) is a five years' apprenticeship, duly legalized by a written contract or indenture signed by the parents or guardians of the apprentice, and almost invariably accompanied by a money payment to the pharmacist, varying in amount from \$100 to \$500, which sums are equal to twice what the amounts would be here, owing to the difference in the purchasing power of equal sums of money in the two countries. During the period of apprenticeship board and lodging are furnished to the apprentice, who usually resides in the house of his preceptor, where he is treated as one of the family. In the case of large firms in the principal cities this is often compounded for a money payment equivalent.

The pharmacist immediately begins a course of daily instruction, both practical and theoretical, extending as far as the scope and size of his business will allow and also as far as his own ideas of his obligations will permit. Should, however, the apprentice be dissatisfied with the amount of instruction received, he may at any period of his apprenticeship appeal to a court of law, either to annul his indentures or exact pledges from his employer for more complete instruction. This is not infrequently done. To shorten the story, when the apprentice approaches the end of his five years' term he is twenty-one years old, and often well equipped by private study and attendance at botanical and chemical lectures and practical work in the laboratory in his leisure hours to pass the Minor examination, he having generally passed the Preliminary at the beginning of his apprenticeship.

The chief difference between English and American pharmacy is in the preliminary education of the apprentices, in England they having been well grounded in the general branches, such as are pursued at a first-class school, up to the age of 16, and with a view to their future lives giving special attention to the Latin language.

During their apprenticeship they have much more leisure as shop hours are much shorter and Sunday work almost nil. Of course there is some variation from worst to best, but, generally speaking, the English apprentice is recognized as less of a machine and more of a human being and a gentleman than his American contemporary. Farther, he is recruited from a higher plane of society and his family is generally possessed of some amount of capital.

I will not take more of your valuable

space upon this subject at present, but will mention that my knowledge of English pharmacy is derived from personal observation during several visits to that country and twenty years' reading of the London Chemist and Druggist. In another letter I will show you some of the glass houses, the dark sides of the picture.

Respectfully,

THOS. LATHAM.

New York, February 13, 1894.

ONE WAY OF PROTECTING RETAIL DRUGGISTS.

To the Editor:

Perhaps you can enlighten me, through the columns of the Era, on a few points that now seem exceedingly indistinct to me. We hear all around us, in drug circles, the cry of hard times, no business, money tight, cut rate stores hurting the business of the legitimate pharmacists, etc., and we wonder what the outcome of it all will be. For the latter obstacle (cut rate stores) we naturally look to our local jobbers for protection to assist us, in a measure, to overcome. I believe, if I mistake not, at the last meeting of the N. W. D. A. and the manufacturers of patent medicines there was some talk on the part of the former to try and remedy this. What are the results thus far? Since said meeting I notice that quite a few patents have advanced in price, and instead of paying former prices there is an advance of from 5 to 15 per cent on them with a favorable outlook of others being included in the list. And all this in the face of hard times. Now comes the question—are these advances the direct results of the meeting between jobbers and manufacturers; if so, how do they benefit a retailer? It seems to me that while the retailer is obliged to pay the advance the only one benefitted thereby is the wholesale druggist, and doesn't that look like exceedingly small protection for a retailer? Another point more serious, at any rate in the end more detrimental to retail druggists, is the fact that certain local wholesale druggists are supplying too many corner groceries with full lines of the more popular patent medicines, and every grocery in my vicinity handling these goods are openly cutting prices, the very thing our jobbers are pretending to fight, yet keep on supplying them. Is it without the knowledge of the jobbers that this cutting is done? It is certainly done openly, and to the direct injury of all surrounding druggists. One step farther, several of these medicine-selling grocery stores have a bar attached where, among other drinks, they offer Paine's Celery Compound and Hood's Sarsaparilla at so much per dose. Great Scott, what is the legitimate pharmacy coming to—with our local jobbers supplying all corner grocers who are openly cutting (and by that I do not mean the advertised cut-rate stores of the city) with everything in the medicine line, the prices on patents advanced, when one can ask his friends to step in and "have something," either Paine's Celery, Hood's Sarsaparilla, and the like? I think it about time for retailers to cry Halt! It seems plain to me that, if these certain local jobbers would see that their goods went to legitimate druggists rather than catering so much to the grocery trade, and would adhere more closely to the sign displayed in their offices, viz., "Positively No Goods Sold at

Retail," it would be "one way of protecting retail druggists," and while they seek to protect us, let them make a start right here at home.

Feb. 2, '94.

RETAILER.

CANADIAN PHARMACY NOT SO BAD.

To the Editor

I would like to reply through the columns of your valuable journal to an article in your issue of February 1st by one who signs himself "A State Board of Pharmacy Man," and who attempts to criticize Canadian pharmacy. He gives his experience as an apprentice in a Canadian store, and asks Era readers to accept it as a typical pharmacy of Canada. He writes of the crude methods employed there, and gives these as the results of "most lofty college training." Now, reader, were these errors of which he speaks due to ignorance, or were they due to the fact that his preceptor was not as conscientious as he should have been? Certainly the latter, for had he never been in a college of pharmacy, his experience as a pharmacist would have taught him to employ better methods. He was probably prompted by avarice, or in other words, "penny wise and pound foolish." State boards of pharmacy and colleges of pharmacy will always have their honest and dishonest pharmacists, but colleges, by their teaching, will produce few of this dishonest class, and will have the advantage of better protecting the public from ignorance, which is so prevalent among those holding state board of pharmacy certificates.

Canadian pharmacy, I will admit, could be much improved, but I must say it is making rapid progress under present regulations, a great deal more than can be expected from our state boards of pharmacy. Their requirement of a four years' apprenticeship, a high preliminary education before entering college, a junior and senior term at college, a junior examination to be passed before entering upon the senior course, and then a rigid examination before graduating, consisting of written, oral and practical laboratory work, places Canadian pharmacy in a position to command respect as is evidenced by the fact that Canadian graduates find ready employment in the United States. These requirements have been secured through the Canadian pharmacy laws, which to my mind set an example that it would be well for us, as pharmacists to follow. I speak more particularly of the laws adopted by the Province of Ontario.

Yours respectfully,

REGISTERED PHARMACIST
for Michigan.

Pt. Huron, Feb'y 8, '94.

A new manufactory of germicides has been established in Buffalo. The article is called Kahle's Bacilline and already commands a very good sale. The establishment which is known as Francis U. Kahle & Co., has been rather unfortunate. It was located last year at Warren, Pa., but no sooner was the manufactory fairly begun than it was burned out. The transfer to Buffalo was made late last fall. The location is within half a dozen rods of the Ferry street station of the New York Central Railroad, so that transportation facilities ought to be of the best. Already quite a large force of operatives is employed.

FARRAND, WILLIAMS & CLARK.

RICHARD P. WILLIAMS.

HARVEY C. CLARK.

JACOB S. FARRAND, JR.

See also page 231.

THE history of the house of Farrand, Williams and Clark, through its many changes up to its present position, has been coincident with that of the city of Detroit itself, nearly back to the founding of it. Way back in 1819 or 1820, when Detroit was but a trading post, M. D. Penniman began to deal in drugs. Later he took a partner in the person of Justus Rice, and the firm was styled Penniman & Rice. Mr. Rice subsequently became the owner of the business, and himself took a partner in Edward Bingham, but from the spring of 1830 to 1836 Mr. Bingham was alone. In the last named year J. S. Farrand, an employe, was taken into partnership, the sign reading E. Bingham & Co., and thus the firm continued until 1841, when Mr. Farrand left to enter other business. The following year Mr. Bingham was burned out, and the house ceased to exist, but in 1845 it was re-established by Mr. Farrand, and

in 1856 W. W. Wheaton was admitted under the style of Farrand & Wheaton. Mr. Wheaton retired January 1, 1858, and in the spring of 1859 A. Sheley became a partner, firm of Farrand & Sheley. In 1860 W. C. Williams, who had been with the house ever since boyhood, was admitted to the firm, which now became Farrand, Sheley & Co. In 1871 Harvey C. Clark, also an old attache, became a partner, and the firm name became Farrand, Williams & Co. J. E. Davis was admitted as a partner February 1, 1874, after being in the employ of the firm for many years, but in January, 1881, he sold his interest to R. P. Williams. In January, 1884, Jacob S. Farrand, Jr., and A. S. Brooks were admitted to the firm.

The jobbing business of the house dates from the year 1845, although for many years after this it continued to carry on a flourishing retail and prescription trade. Since 1862 its business has been exclu-

sively wholesale. The location of Mr. Farrand's original store, occupied in 1845, was on Woodward avenue. In 1851 he removed to 96 Woodward avenue, where the business continued to be conducted until the fall of 1872, when it went into more commodious quarters in a new building erected by the firm at the corner of Larned and Bates streets. Farrand, Williams & Co. continued until February, 1880, when a dissolution of the firm took place and Farrand, Williams & Clark established themselves at 32 and 34 Woodward avenue, buying out the house of John J. Dodds & Co. They remained at this location until Feb. 16, 1894, when their building was destroyed by fire as related on page 231. The following year Jacob S. Farrand, Sr., died, since when, with no change in the firm name, the business has been conducted actively by the gentlemen whose portraits are given here. Mr. Farrand's widow retaining a financial interest in the concern.

TRADE COMMENT.

DIRECTORY SUPPLEMENTS.

The third (1894) edition of the Era Druggists Directory has now been issued, and the regular publication of the "Supplements" to this new edition was begun in the (February 1st) issue of The Pharmaceutical Era. We solicit from our readers information regarding any changes among the drug stores in their locality, such as new stores, removals, sales, failures, deaths, etc., etc. Address

D. O. HAYNES & CO., Publishers,
DETROIT, MICH.

It's a poor rule that doesn't work both ways.

The man who works with a will—the Probate Judge.

When a man talks into a telephone what he says goes.

The toilet soap industry of Japan is rapidly increasing, and the quality of goods manufactured is said to be quite up to the American and European standard of taste in such matters. The exports from the Flowery Kingdom in 1892 were 50 per cent more than in 1891.

A nickel cigar called The Oath is being pushed in Ohio by placards reading: "Take an Oath, and tell the truth if you ever smoked a better nickel cigar." One of our exchanges says that this is not the first time that an oath and a nickel cigar have run in company.

The United States now has in circulation more kinds of money than ever before. There are gold coin, silver coin, silver certificates, old United States notes, treasury notes of 1890, outstanding national bank notes, gold certificates and legal tender certificates used by banks.

Cigars and cheroots to the number of 4,330,298,386 were manufactured in the United States during 1893. In spite of these almost inconceivable figures this shows a decrease of 423,261,631 as compared with 1892. During 1893 the output of cigarettes was 3,232,715,400, which is an increase of 219,605,240 over 1892.

The space to be occupied by the principal countries of the world at the Antwerp exposition has been allotted as follows: United States, 150,000 square feet; France, 120,000 square feet; England, 75,000; Germany, 75,000; Italy, 40,000; Canada, 30,000; Austria, 30,000; Russia, 16,000; Holland, 13,000; Belgium, 15,000.

It will be remembered that the case of the State of South Carolina against the Commissioner of Patents for his refusal to register the trade mark "Palmetto" for use upon the liquors handled by the state was a short time ago decided against the commissioner by the Supreme Court of the District of Columbia. It was held at the time that the commissioner had no discretion in the matter and could not decide as to the right of the state to engage in trade with foreign countries but should only decide as to whether the state had a right to the trade mark as such. This decision has now been reversed by the Court of Appeals, which holds that the duties of the commissioner are not simply ministerial, but call for the exercise of judgment and discretion, and that in this case the court can find no justification in the claim that the state has a right to conduct a traffic in liquor outside of its bounds.

The expenses of the United States government during the twelve months ending December 31, 1893, amounted to \$382,454,897.37, and the receipts were \$312,895,172.00 during the same period. It is safe to say that an ordinary druggist attempting to do business upon the same plan would find himself in the hands of the sheriff inside of thirty days.

A new plan of railroad tickets was adopted by Hungary recently. The traveler will make out his own ticket. The government will sell railroad marks (or stamps) and supply the blank cards. The passenger will, when he desires to take a journey, write on the card his name, starting point and destination, and affix as many stamps as the published list of fares calls for.

The Court of Appeals of the District of Columbia recently decided the case of Schaeffer against the Commissioner of Patents for refusing to issue letters patent for a new coloring material consisting of a compound of alizarin and boracic acid, by affirming the decision of the commissioner. The application was rejected on the ground that such a combination had been described in Crooke's Handbook, published in 1874. The court held that while prior publication, of a nature to defeat a claim for a patent, must describe the process in such a manner as to enable persons skilled in the art to repeat the process claimed without assistance from the claims and specifications of the applicant for the patent, it was not necessary that such prior publication should be so specific as to teach how to make the article, but the real requirement was that the thing sought to be patented should be described, and not the steps antecedent to its production.

The claim that carbonation kills the bacteria which might naturally or by accident be present in waters used as popular beverages, has always been received as a statement emanating from interested parties, put forth with the object of increasing the sale of such goods. It is quite gratifying, therefore, to learn that Dr. Charles Slater, bacteriologist to St. George's Hospital, London, has recently published a paper containing the results of a careful examination of carbonated waters. Several experiments showed that a cubic centimeter of water after twenty-four hours of carbonation contained from 400 to 3,000 organisms, while in the course of three weeks these had almost entirely disappeared, and it was noted that the most dangerous pathogenic organisms, such as those of cholera and typhus, were rendered harmless in from one to two weeks. From these investigations it was concluded that "a carbonated water made from a proper source, and kept for more than fourteen days, appears to offer complete safety from the usual water-carried diseases." This apparently authoritative announcement will undoubtedly do much to extend the use of carbonated beverages, and manufacturers and dealers who will obtain water from proper sources, sterilize it as thoroughly as possible by distillation or filtration, and store their finished carbonated product from two to three weeks before placing it upon the market, will be safe in assuring their patrons that the use of beverages prepared in this manner is conducive to health, both as remedial and preventive agents.

ADVERTISING HINTS.

The use of current events of an exciting character as a means of calling attention to advertisements appears to be enjoying a renaissance. But a few years ago the public was afflicted by the appearance of articles of a decidedly sensational character, which disgusted the reader by more or less covert suggestions to take somebody's pills. This method of advertising quite properly exhausted itself after a brief season. The revival referred to is, however, of quite a different character. It is apparently in abler hands, and for this reason the ideas upon which it is based can be commended as worthy of imitation within proper limits. The most unique instance of this sort is that furnished by the J. S. Kirk Soap Co., of Chicago, whose advertising expert selects for publication in the advertising columns of the daily papers important public events of the previous two or three days, such as the silver debate in congress, the Hawaiian matter, the Brazilian trouble, Corbett and Mitchell, illustrates them in a humorous style, and follows a few remarks of the same character by a clever reference to the goods of his firm. It is needless to say that these advertisements are read with interest and satisfaction, and the general reader looks for these "ads" as regularly as the merchant looks for the market reports.

Another instance in this line is that furnished by a Chicago firm in an advertisement in a recent number of the Sportsmen's Review. A photographic reproduction of a clipping from a daily newspaper is given prominence in the center of a page. The clipping refers to a meteoric display at Wilmington, N. C., in which a local colored astronomer claims to have seen the letters "W. W. W." plainly outlined in the heavens. At the top of the page appears in one line in full black face type the name of the firm—The Western Wheel Works—while at the bottom of the page is simply the office and street address of the firm. The effect of the advertisement is not spoiled by attempting to explain the obvious connection between the initials of the firm and the phenomenon referred to in the clipping. The consequence is that the reader finds something that attracts attention, and then makes an impression on the mind by the studied neglect of the advertiser to take full advantage of the incident. These examples are cited merely to illustrate one of the many avenues through which the modern advertiser is now seeking to win public attention. The successful advertiser must now be a close student of the world's daily history, and be prepared to take advantage of its important events.

A Cicero, Ill., drug clerk helped himself a little too freely to alcoholic beverages in his employer's stock, and wishing to sober up quickly, took certain drugs with that end in view. The result, however, was opposite to what was expected and for a time his insane antics occasioned much apprehension in the minds of people around, and a few shots from a revolver did not have a particularly quieting effect. Hard-hearted policemen arrested him and the judge imposed a heavy fine.

Burglars abstracted \$50 from the store of druggist H. N. Clark, at Cornwall, N. Y., January 20.

FARRAND, WILLIAMS & CLARK.

About 6 o'clock on the morning of February 16 fire was discovered in the building occupied by the wholesale drug firm of Farrand, Williams & Clark, 32 and 34 Woodward avenue, Detroit. The cold weather and the deep snow delayed the arrival of the fire department somewhat, and in a short time where once stood the commodious quarters of a successful business house there remained but blackened ruins to tell the story of a disastrous fire. The origin of the fire can only be conjectured, as there was no one in the building at the time. No watchman was employed and the engineer had not yet arrived. The fire was reported to have been preceded by an explosion and to have started on the fourth floor, where it quickly spread, and in spite of the steady streams of water poured into it, the building was soon entirely gutted, and the upper floors and stock had fallen with a crash to the basement.

The building was a large double store, five stories high and modern in style and build, its thick walls preventing the conflagration spreading to the adjacent property. It was valued at \$40,000, with an insurance of \$30,000. January 1 the stock inventoried \$160,000, upon which there was an insurance of \$120,000.

As noted in these columns a short time ago, Farrand, Williams & Clark were making arrangements for an early removal into their own building on Larned street east, formerly occupied by the old firm of Farrand, Williams & Co. Workmen had been engaged night and day to get the building into shape for occupancy. This force was immediately increased to about 100 men, and the firm commenced at once to fill orders in this building. It was certainly doing business under adverse circumstances, but the same enterprise which has ever actuated the business policy of the firm was displayed upon this occasion by the following characteristic note, mailed to customers before the flames were yet extinguished:

Detroit, Friday, February 16, 1894, 6:10 a. m.—Our entire stock of drugs, etc., is destroyed this morning by fire. 9 o'clock a. m.—We have opened our office at our old stand, 11-13-15-17 Larned street east, and are now able to attend to business. Send us your orders; we will give them our usual prompt attention.

Offices were also opened in room 18, Campan building, where the correspondence and general business of the house will be, for the present, transacted. Expressions of condolence were received from their many friends in the jobbing trade, the city jobbers expressing their sympathy and offering assistance in person. Following are a few of the letters and telegrams received:

TELEGRAMS.

New York, February 16.

We extend our heartfelt sympathy in your trouble.

NEW YORK QUININE & CHEMICAL WORKS.

Columbus, February 16.

Regret to learn your great loss. Command us if we can assist.

THE KAUFMANN-LATTIMER CO.

Toledo, February 16.

We are sorry to learn of your fire. You can have any part of our stock.

THE WALDING, KINNAN & MARVIN CO.

RUINS OF THE FARRAND, WILLIAMS & CLARK FIRE.

Grand Rapids, February 17.

We extend our sympathy and offer, if any, service possible for us to give.
HAZELTINE & PERKINS DRUG CO.

St. Louis, Mo., February 16.

We sincerely regret to hear of your loss through fire. Can we be of any service?
MALLINCKRODT CHEMICAL WORKS.

Cleveland, O., February 16.

Have just learned of your loss, and offer our sympathy. If we can be of aid to you, do not fail to call upon us.

BENTON, MYERS & CO.

Cleveland, O., February 16.

Just learned of your loss. Accept sincere sympathy and offers of assistance.

STRONG, COBB & CO.

LETTERS.

St. Paul, February 16.

Gentlemen—We are extremely sorry to hear of your loss by fire, and that, too, just as you were removing. We trust, however, that you will be enabled to remove into your new quarters with a complete new stock, and your loss will be very little, if any, after settlement is made.

Yours respectfully,
NOYES BROS. & CUTLER.

Chicago, February 16.

Gentlemen—We regret to hear of the destruction of your store by fire. Having suffered a like experience more than once, we can fully sympathize with you. If we can be of any service to you, it will be only necessary for you to command us.

Very truly yours,
LORD, OWEN & CO.

St. Louis, February 17.

Gentlemen—We regret to learn that you had the misfortune of having a fire in your establishment, and trust that the loss is not serious, and also hope that you will soon be able again to resume business.

Sincerely yours,
MEYER BROS. DRUG CO.

St. Louis, February 17.

Gentlemen—We were very sorry to notice in last night's papers that your establishment has been burnt out. We beg to tender you our sincere sympathy, and if we can be of any service whatever to you, please command us freely. We remain

Yours truly,
HERF & FRERICHS CHEMICAL CO.

Chicago, February 17.

Gentlemen—We regret to hear of your loss by fire, and trust that you will be in shape to attend to business in a short time in your new headquarters. We remain,

Yours respectfully,
MORRISON, PLUMMER & CO.

Chicago, February 17.

Gentlemen—We hear with the greatest regret of the destruction of your establishment by fire—having ourselves passed through the fiery ordeal three times (though, fortunately, neither time the fire having originated in our own store)—we can fully sympathize with you, understanding what it means to gather together a complete drug stock. Hoping you are fully insured, and assuring you that if in any way we can be of any service to you, we will gladly have you call upon us, we are

Very truly yours,
PETER VAN SCHACK & SONS.

DRUG STORE MANAGEMENT.

There are two things of paramount importance in the practice of pharmacy which claim the attention of the beginner at the outset of his career, and these are, the location of his place of business and the proper selection of his stock. These two steps, which are of such a self-evident character that their consideration seemingly involves a discussion of the commonplace, are in reality the foundations upon which every aspirant for success hopes to erect a substantial structure. A careful canvass of all the factors in the problem of starting right, will therefore do much to forestall the necessity of experiencing what is popularly known as having one's "eyeteeth cut" by a series of failures or a doubtful success. It is perhaps unfortunate that the business life of the present is really a highly organized system of warfare, and that the beginner must enter it handicapped by inexperience, and expect to do battle with hardened warriors. But such is undoubtedly the situation, and an early recognition of this fact will be all the more serviceable.

One of our most honored and beloved poets has pronounced a beautiful benediction upon the one who is able to make two blades of grass grow where but one had grown before, but the man who attempts to make this application to drug stores, and cause two to exist where but one existed previously, is apt to learn that the laws of production operate under variously strange conditions. He will at the outset encounter the persuasive influence of those who have goods to sell to him at the cheapest of prices, and those of the people who desire to buy his goods at prices which are correspondingly cheaper, to say nothing of his competitors, who resent his intrusion as an act which may cut their means of subsistence in two. To the beginner therefore, who has the money, necessary education and a desire to engage in the drug business for himself, some advice may be offered which will possibly be of more service than an experience gained through trial or failure.

Leaving the question of qualification and inclination to one side, the important one of money, is the one to most seriously engage attention. Should the beginner run in debt for a portion of his stock? As it is estimated that 90 per cent of those engaging in business fail, and our mercantile agencies report every year an alarming list of failures due to want of capital, it is safe to answer this question with a decided negative. Instances are plenty in the biographies of successful men when this rule was not observed, but the biographies of unsuccessful men which are, to use a Celtic expression, never written, are so full of instances of the opposite course, that the rule "Never go in debt" can be cited as a safe one to follow. There is safety in the wisdom of Ben Franklin, who both preached and practiced the doctrine of frugality and saving. Assuming that the fact is readily admitted that the debtor is more or less a slave to debt, and that a little surplus capital is like the motive power to a balloon, the placing of capital in the drug business, with the expectation of both making a living and providing against inevitable rainy days and old age, is a proceeding of great moment.

The desire of every student, clerk or apprentice to some day become the proprietor or a pharmacy is a laudable one, but this desire should always be checked until

the opportunities are clearly propitious, and until the demand of the public is unmistakable for the establishment of a new institution of this sort. This question is settled by legal enactments in some foreign countries, where the number of apothecaries is made to bear a relation to the population, but in the United States the individual is left to decide this question for himself. In cities most of the new stores are started in outlying districts and suburbs, and in looking for a location under such circumstances the territory from which trade is to be drawn should be carefully gone over. The location of competitors should be noted, and the prospect of growth in population, means of transit, prices of real estate, character of the people, the location of physicians, are all points to be seriously thought of. In a country town the same questions must come up for settlement, and where the trade is to be divided with one or more competitors, their personal characters as business men should be considered, and conclusions reached as to their trade-drawing and other qualities which affect their standing in the community.

It is not inferred that these questions are not considered by everyone starting in business, but they are simply referred to for the reason that they should be given greater attention. There is enough at stake for some downright hard study upon all their phases.

A location having been decided upon, the buying of a stock is the next step of importance. In purchasing a business already established the same precautions should be observed as in choosing a location and the apparent value of the trade carefully estimated. Books and accounts of the establishment should be carefully gone over to ascertain the income and expenses, and if a credit business is done the methods of collecting should be investigated, as a new proprietor will have uphill work in the face of a previously established loose system of making collections. An absence of correct bookkeeping methods in any pharmacy, however small, should at once create a suspicion that its proprietor does too insignificant a business to be worth recording, or is not running his business for all there is in it. Inventories should also be carefully scrutinized for evidences of growth in the business. The involving of an old stock of goods with perfect equity to all parties concerned is an exceedingly difficult operation, especially when the accumulations of old stuff, which seem inseparable from the drug business, are considered. This can only be accomplished with any degree of satisfaction when a spirit of concession and willingness to average things actuate both parties. Staple drugs can usually be estimated at market rates, but accumulations of old shelf-worn out-of-date patent medicines, present many distracting problems for solution. Ordinarily the greatest concessions should be expected from the seller on this class of goods. In buying and selling an old stock of drugs where both parties desire to obtain the best bargains possible, the employment of an impartial referee who is well acquainted with values is a proceeding which is advisable in all cases. In purchasing a new stock there are of course hundreds of articles which every drug store must have but the outlay for many preparations may be limited by consulting the requirements of neighboring

physicians. By pursuing this course from the outset the pharmacist may often accomplish a great deal by interesting the medical profession in pharmacopoeial preparations, which the druggist can manufacture and furnish with satisfaction to both parties. This matter should, however, be undertaken with the greatest delicacy, as the medical profession as a rule is not disposed to take advice from a beginner in pharmacy, and when suggestions of such a character are offered they should be presented in a spirit which recognizes the propriety of a choice of remedies being left to the physician.

As regards the buying of fixtures the question of financial resources and utility should govern. It is quite true that the public has been educated to expect great artistic effects from the interior arrangements and furnishings of a pharmacy, but a reputation for first-class goods and courteous treatment will cover a multitude of such apparent deficiencies. Great attention should be paid to the storage of drugs and convenience of access to them. Much loss and damage results from a neglect of these precautions, and as a rule money expended for the best containers embodying the latest improvements is a good investment.

In conclusion the beginner in the drug business, who will consider every possible point in choosing his location, use every precaution in buying, and will remember that inexperience will be enough of a bar to progress without the encumbrance of debt, ought to be reasonably sure of success.

SOME MERCHANTS DO BUSINESS THIS SAME WAY.

A curious instance of the tenacity with which the sturdy Scotchman clings to a habit when once formed, is given in the Edinburgh Scotsman: Once, in the Foreign Office, a new chief was taking possession of his rooms, and he came face to face with a soldier, pacing the passage. He marveled because the guard gave the word: "Keep to the left." "Why do you say: 'Keep to the left?'" "I don't know." The statesman investigated the singular affair, and, after not a little trouble, a clue was found and followed. Fifty years before the passage had been painted, and an orderly had tramped it with orders to bid everyone to "Keep to the left," and avoid the wet paint. This order had stood unchanged and practically unquestioned for a term of fifty years.

OUR MONEY

The total amount of paper money in circulation in the United States upon December 31, 1893, was \$1,159,156,065. Of this amount \$67,220,000 was in ten-thousand dollar bills of the following classes: Gold certificates, 2,833; currency certificates, 3,888; United States notes, 1. There were three United States notes, 2,833 gold certificates, and forty-one currency certificates of the five-thousand dollar denomination. The ten-dollar notes furnish the largest item in circulation, the amount being given at \$308,208,736. Five-dollar notes amount to \$250,203,499, two-dollar notes to \$30,508,653, and the dollar notes to \$39,568,642. It is found that fractional parts of a dollar to the extent of \$27,840 are still in circulation, while the comfortable amount of \$1,000,000 is set down opposite the item "unknown, destroyed," in the treasurer's report.

Written for the Era.

SOME PRACTICAL SUGGESTIONS FOR DISINFECTION.

By L. Sollmann.

First, to prevent the breeding of disease germs:

Damp Cellars—Put five pounds of coppers in a bucket, fill with hot water and wash the cellar walls with this solution. If the cellar has a paved or cement floor wash the floor also. If it is an earth floor sprinkle over it crushed coppers, a pound to every 100 square feet.

Water Closets—If connected with the sewer system, make a solution of coppers, five pounds to a bucket of water, and pour a pint into the bowl twice a day, close up the place tight and burn in a metal basin one-half pound of stick sulphur. A less unpleasant but also less efficient way consists in placing an open half-pound can of chlorinated lime in the bathroom, stirring up the lime occasionally. If the bowl is not connected with the sewer system, take three ounces of corrosive sublimate for every 100 gallons of matter, dissolve it in two buckets of hot water and pour it into the bowl, aiming to rinse as much as possible the walls of the vault. Afterwards throw into the vault once a month five pounds of coppers, dry, if the vault is rather wet, or dissolved in hot water if the vault is dry. Fumigate the place as previously directed.

Yards—Rake up all garbage, mix it with combustible matter such as straw or paper, and burn. Sprinkle the yard with a mixture of salt and coppers, equal parts, one pound each to every 200 square feet.

Sinks—Keep them well scrubbed with soap or washing soda.

Second, to disinfect with a view of killing the germs of contagious or infectious diseases:

For disinfecting the dwelling follow the instructions above given, doubling the quantity of the disinfectant.

Excreta from the patient should be collected in a vessel containing a solution of corrosive sublimate, one-quarter ounce to the gallon, and left in this solution for a half hour before being emptied into the vault. All that can be burned should be burned.

All linen used in a sick room should be boiled in a solution of corrosive sublimate, twelve grains to one gallon of water, and then twice rinsed in clean water. All tableware which has entered the sick-room should be similarly treated.

As soon as possible close up the sick-room tight, leave in it all the dry goods of the patients or nurses that cannot be boiled or burned, and light two pounds of stick sulphur in a metal bowl. Keep the room closed for two days and then ventilate for a week.

Do not place any trust in carbolic acid or chlorinated lime, as in practical use they are too much diluted to be effective. Lime is a good disinfectant whilst it is slaking.

HE MISSED THE DATE TO IT.

Editor (having glanced at the contributor's joke)—Where's the other?

Contributor—Other? There isn't any other.

Editor—Oh, I thought that Noah took two of every kind into the ark.—Town Topics.

The world's yearly consumption of black pepper as a condiment is estimated at \$3,000,000.

ADVERTISING MISCELLANY.

An item which has been floating around for some time in the "funny" columns of the press, reads as follows: "A farmer at Stanberry, Mo., had enough simple faith in mankind to advertise in the local newspaper for the recovery of a ten-gallon keg of blackberry brandy, which he lost out of his wagon on the way home." The expression "simple faith in mankind" discloses the reason for the existence of this piece of humor, and the average reader at once puts human nature against simple faith, and comes to the conclusion that the man who advertises for such a commodity, under such circumstances is throwing his money away. This verdict will be found to be almost universal, but similar instances are not confined to farmers who have simple faith in mankind. There are apparently many business men following the same course. They have goods to sell and naturally expect that their advertising will have the desired result of aiding in such sales, but many of them are following after a certain manner the methods of the farmer. In the first place they are not advertising the right kind of goods, and in the second, they may word their advertisement in an unattractive manner, or in a way to actually repel trade, for we can imagine that perhaps a portion of the readers of the farmer's "ad" started out the next day with the idea of finding that keg of blackberry brandy, and appropriating it to its own use instead of restoring it to its rightful owner.

The advertising of the fact that a man keeps certain staple goods, or a complete stock of goods has no effect upon the buyer, as the latter knows that every merchant in the same line of business does the same thing, or at least pretends to. This sort of advertising may be illustrated by supposing that an announcement was made by a druggist that he furnished a cork in every bottle of medicine sold. This would have no effect upon his customers, as they are already aware of the fact, and they also know that all his competitors do the same. But if the announcement were made to read "corkscrews," attention would be attracted at once, as the act is somewhat unusual, and all druggists do not do such things.

The public now looks for bargains or special offers, and the man who desires to advertise himself or his staple goods must do it with something else. He must choose "leaders," and depend upon their drawing power to get people into his place of business. There are several successive steps in performing such a task which must be carefully observed. The first is the selection of an article which the public wants, and this must be either something new or a novelty, or it must be some staple article upon which prices may be so fixed as to attract attention. This latter method may be a reprehensible practice from the ethical standpoint of some, but unfortunately our commercial captives pay more attention to dollars than to ethics, their actions being usually beyond the control of even a majority, and we are only dealing with such matters as we find them. The second step is engaging the attention of the public. Two examples of advertising to accomplish this end are shown, which speak for themselves. Neither is entirely new, but it is an easy matter to settle their comparative ages.

**JOHN DOE,
DRUGGIST,
DEALER IN
Drugs, Medicines,
Toilet Articles, Perfumery, Etc.**

PRESCRIPTIONS CAREFULLY COMPOUNDED.

43 Easy St., - PILLVILLE.

The first is a rather languid announcement that John Doe is still on earth, doing the same kind of business that he did last year, and perhaps has some of the same old goods. If anyone happens to want any of his goods, or should happen to get sick, why, John is still there, and people can, if they feel like it, drop in and see him the next time they come to town. Richard Roe, on the contrary, invites people to come in right away, and strike while the iron is hot. That soap may all be gone if they don't hurry.

**BLANK'S
FAMOUS**

TOILET SOAP

**6 CENTS
PER CAKE.**

This is the usual 10-cent cake. I bought a big lot of it at big-lot prices. I knew it wouldn't go out of style. Its better to sell soap on small profits than to sit around complaining of the hard times.

Now is Your Chance.

RICHARD ROE,

Druggist,

10 Hustle Ave. PILLVILLE.

Everybody knows that he keeps the same kind of goods that his neighbor, Doe, does, and compounds just as carefully, but they didn't know he was selling that soap at 6 cents per cake. They will go for the soap, but at the same time they cannot help seeing his entire stock of goods, and quite likely when they leave home to get some of that soap, they will conclude that as they are going to Richard's place of business they might as well buy a tooth brush, as they are saving a few cents on soap and can thus afford it.

Judge—"Have you anything to say before sentence is passed?"

Prisoner—"No, your honor, except to call your attention to the fact that that fool lawyer what defended me was appointed by yourself."

The Orisena Co., 209 State street, Schenectady, N. Y., has been organized to manufacture toilet articles and specialties, with branch offices at Saratoga, N. Y., and Boston, Mass.

An international exhibition of wines and olive oils, with the machinery used in such industries, will be held at Milan, Italy, some time during the present year.

THE OIL-PRODUCING PLANTS OF FORMOSA.

The following particulars of the oil-producing plants found in Formosa are extracted from a special report on the resources and trade of that island prepared by Mr. Alex. Hsieh, late Acting British Consul at Tamsui, and published by the Foreign Office as Commercial No. 11 (1893), and reprinted from the *Phar. Jour.* and *Trans.*:

Oil-Producing Plants.—Since the introduction of kerosene oil into China, the demand for native lighting oils has been on the decline, but for cooking purposes some of these oils are produced in large quantities. Oil-yielding seeds are likewise exported, to a limited extent, to foreign countries, where the oil is extracted and used to adulterate more valuable oils.

Of the seventeen oil-producing plants cultivated in China, eight grow in Formosa. They are:

1. *Dolichos Soja*, L. (?)—More oil is extracted from this bean than from any one of the other oil-yielding plants of China. The two kinds of bean treated for oil are small in size and oval in shape, one having a whitish yellow epidermis and interior, the other being green throughout. They are probably sub-varieties of the soja bean. The process of extraction is worthy of description. The first thing that strikes the eye of a visitor to a bean-oil factory is the enormous stone wheel which is used to crush the beans. It is of dressed granite, about ten feet in diameter and two and a half feet thick at the axis, gradually contracting to a foot at the rim. This wheel, which is of enormous weight, revolves in a well thirty to thirty-six inches broad, paved with stone and bounded on each side by a low wall of concrete some three feet high. The massive wooden axle on which the wheel revolves has its opposite end firmly fixed in a huge beam, which rises vertically from the center of the circle formed by the inner wall of the well, and which revolves with the wheel. Behind the wheel and supported by a plank fixed on and near the opposite end of the axle, is a wooden framework which just sweeps the floor of the well. The front of the framework has a metal share like a plow, and affixed to the rear is a small square of wood inclined to the inner wall of the well, with a loop of rope or leather nailed to it. The beans to be crushed are heaped in the well against the inner wall. Two mules, blindfolded, are harnessed to the wheel, one in front, the other behind, and walk outside the outer wall. At the first revolution nothing is crushed, but the loop at the end of the framework drags the beans onto the floor of the well, and at the second revolution these are crushed and swept towards the outer wall by the share making way for a fresh supply of beans dragged on by the loop arrangement at each revolution. The beans are flattened into thin round wafers and are crushed a second time before they are ready for further manipulation. After the second crushing, bean wafers sufficient to make a cake four inches thick and two feet in diameter when compressed are put in a square piece of sacking, and placed on a wooden grating above a caudron of boiling water. In a few minutes they are rendered quite soft by the steam which passes up through the grating to the sacking and its contents. During the process of steaming another workman has been arranging a series of soft straw brooms, which are also steamed so as

to form the bottom of a couple of narrow metal bands, surmounted by a wooden ending, over which the tips of the straw brooms project. Into this the steamed beans are poured and trampled down by foot until the mass is quite hard. The projecting straw tips are then brought over the top of the beans by foot, and trampled down so as to form a covering. The wooden casing is removed, and the metal bands arranged a short distance apart near the top and bottom of the cake respectively. The whole is then put into a primitive wooden press, and subjected to considerable pressure by the driving in of successive wedges. The oil is expressed and drains into an underground tank, the top of which is on a level with the stone guttered slab on which the lowest cake rests, for half-a-dozen cakes, one above the other, may be undergoing pressure in the same press at the same time. When all the oil has exuded from the cakes they are taken from the press, the metal bands and straw casings are removed, and, after being left to dry for a time, they are ready to be shipped to other parts of China for manure. The beans yield about 10 per cent weight of oil and the cakes when removed from the press weigh some sixty-four pounds, and are worth about 2s 9d each. They constitute a very valuable manure, and are carefully macerated before being applied to the soil.

To show the commercial value of this industry, it may be mentioned that 60,000 tons of bean cakes were exported from Chefoo during 1890. Nor is Chefoo the principal exporter. Newchwang sent out over 156,000 tons in the same year. In Formosa these beans are grown and the oil is extracted in the above manner, but only in quantities sufficient to meet local requirements. The refuse cakes are not exported. The oil is used for both cooking and lighting purposes.

2. *Brassica Chinesis*, L.—Rape is usually a winter crop in China. Towards the end of October the seeds are planted about a foot apart in beds; in March the plants are in full flower, and in early June the crop of seeds is harvested. This refers to Mid-China, where the temperature is mild and the frost is not so severe as to retard sowing till after winter. It is more widely cultivated in China than any of the other oil-yielding plants. The seeds are treated much in the same way as beans, being crushed, steamed and subjected to pressure. Like the preceding, rape-oil is used for lighting as well as for cooking.

3. *Sesamum Indicum et orientale*, D. C.—Both the white and black-seeded varieties of sesame are cultivated in China, and from Formosa there is a very considerable export of seeds which find their way to France, where sesame is largely used to adulterate olive-oil. It is a summer crop. The seed is sown in May, usually in rows with other crops, such as cotton on the mainland; the plant blossoms in July, and the harvest takes place in September and October. Sesame is essentially a food oil. Refuse seed-cake is much used in Formosa for adulterating opium.

4. *Arachis hypogaea*, L.—The groundnut, a native of Africa, is extensively cultivated in China, not only for the food which the nuts supply, but also for the oil which they contain. Although the Chinese have not yet discovered a good practical method of removing the shells before pressing, yet the oil, necessarily impure on that account, is highly appre-

ciated as a food, as well as a lamp-oil. To obtain the oil, the nuts are roasted, rolled, winnowed to get rid of the shells—steamed and pressed. The plant prefers a sandy soil, such as is found in the neighborhood of Chefoo, but it appears to be equally at home in Western China and in Formosa. These nuts will be found on every roadside stall in China.

5. *Stillingia Schifera*, S. and N.—From the seeds of the vegetable tallow tree, both tallow and oil are produced. They are used for lighting purposes only, and as the method of extraction is ingenious, a short description thereof may be of some interest. When the fruit is ripe, the dark-brown protecting covering which encircles each seed opens and falls to the ground, leaving exposed bunches of grayish-white berries, which resemble coffee-beans in appearance and size. These are collected by hand, steamed, and thereafter pounded in an ordinary rice trough. By pounding, the soft mealy mesocarp is partially separated from the kernels. The whole is then placed in a bamboo sieve, the meshes of which are just large enough to allow the mealy matter to be scrubbed through, and small enough to keep back the kernels, which are hard, black, and about the size of peas. From the mealy substance the tallow is expressed in primitive wooden presses. The oil is derived from the kernels in the following manner: They are dried in the sun and passed between two mill-stones held at such a distance apart, by means of a bamboo pivot, as to crush the hard shells of the kernels without injuring the white interiors. The whole is then passed through a winnower, which separates the broken shells from the solid matter. The latter is thereafter placed in a deep iron pan over a fire, the crushed oily shells making an excellent fuel, and roasted until it begins to assume a brownish color, the process being accompanied by continual stirring to prevent burning. It is then crushed by a huge stone roller in a circular stone well, steamed, made into cakes like cheeses, with bamboo and straw casings, and passed through the wooden press. The resultant is a good lighting oil of a brownish-yellow color.

I have previously alluded to the remarkably ruddy tint which the foliage of this tree assumes in autumn, a tint which lights up the landscape wherever the tree grows, and forces its beauty on the beholder. Although it grows wild and uncared for in North Formosa, no use whatever is, so far as I can ascertain, made of its fruit. There, too, the berries appeared to me to be inferior and much smaller than those produced by the cultivated and well tended trees on the mainland. But the secret no doubt is that, whereas in Formosa the tree is utterly neglected, in the great centers of tallow and oil manufacture in China it is grafted, and consequently yields superior fruit.

6. *Camellia Thea*, Link.—In all the tree-growing districts throughout China, the seeds of the tea plant not required for raising new bushes are collected and treated for their oil, which is employed for both food and lighting.

7. *Cinnamomum Camphora*, N. and E.—Although the camphor laurel is found in many of the provinces of China, where it is highly valued on account of its wood, yet Formosa is the only province in which camphor is manufactured. I shall have occasion to deal hereafter with this industry and need only mention in this

place that when the camphor is being distilled from the chips of camphor-wood an essential oil exudes and drops into the boiling water underneath. This, as well as the liquid which exudes from the camphor when awaiting shipment, is collected and exported under the name of camphor oil. It is used for chemical purposes.

8. *Ricinus* sp.—The castor oil plant grows wild throughout Formosa; but in the north of the island, oil is not extracted from the seed, nor is any use whatever made of the plant. In the south a little oil is extracted for purely local uses, but no attempt is made to cultivate the plant. This species, which has green stems and leaves, does not attain the height of *Ricinus communis*, which is distinguished by its purple stems, branches and leaves. The latter, grown from imported seed, may be seen as an ornamental shrub in gardens near Tamsui.

I have not included *Diospyros Kaki*, L. f., which grows in Formosa as well as on the mainland, among oil-producing plants, for the juice of its fruit should be classed as varnish and not as oil.

SCIENCE IN PRISON.

While Siemens was stationed, in 1840, at Wittenberg, he became interested in the discovery, then recently made by Jacobi, of the precipitation of metallic copper from the sulphate by means of the galvanic current. He repeated the experiments successfully, and applied the process—so far as his means would permit—to other metals. His studies were interrupted by his arrest and imprisonment for connection as second with a duel between two of his brother officers. Not relishing the idea of spending an indefinite period in idleness, he managed on his way to the citadel to make arrangements to have the materials required in his electroplating researches smuggled in to him. He set up a small laboratory in his cell and made himself contented there. Recollecting, from experiments he had made in the Daguerean process, that hyposulphite of soda would dissolve the insoluble salts of gold and silver, he applied the principle to electrolysis with astonishing success; and he believes, he says, that it was one of the greatest joys of his life when a newly silvered teaspoon which he had immersed at the zinc pole of a Daniell cell into a cup filled with a hyposulphite gold solution, while the copper pole was connected with a *louis d'or* as an anode, "was converted in a few minutes into a gilded spoon of the most beautiful, purest golden luster." Galvano-plating was then new in Germany, and his discovery made much talk. A jeweler of Magdeburg visiting him in prison to examine into its merits, he sold him the right to use it for forty louis, and thus obtained means for continuing his experiments. He counted upon enjoying still several months of captivity, and the unmolested prosecution of his researches, when the unwelcome message came to him of a royal pardon, and he was obliged to leave the citadel at once, without house or other spot in which to set up his apparatus. He asked leave from the commandant to stay a little longer, but was denied, accused of being ungrateful for the royal clemency, and was hurried out of his quarters at midnight.—*Pop. Sci. Monthly.*

The Shepherd's Sarsaparilla Co., Skowhegan, Me., has been organized with a capital stock of \$10,000.

TRADE NOTES.

EASTER DYES.

These may be obtained of the following firms, all of whom have advertisements in this issue:

O. A. OHL, Tiffin, Ohio.
PAAS DYE CO., Newark, N. J.
J. J. FLECK, Tiffin, O.

J. L. Hopkins & Co. will move May 1 to 16 Platt street, New York City.

The Glidden & Joy Varnish Co., Cleveland, O., has changed its name, and is now known as the Glidden Varnish Co.

Katz & Cauffmann, dealers in drug sundries, Rochester, N. Y., have been succeeded by Oscar J. Katz.

L. A. Clark Co., inc. 371 Main street, Bridgeport, Conn., manufactures Rio Specific Tablets, and a line of toilet articles for the drug trade.

Irwin, Kirkland & Co., Decatur, Ill., make everything in "non-secrets," from Corn Killers to Hair Growers; nice packages, reliable quality and low prices.

The Redlich Mfg. Co., 377 N. Clark street, Chicago, in addition to their line of faucets, bungs, labels and corks and general bottles' supplies, are proprietors of D'Estrier's Cream Food for babies and convalescents.

Attention is directed to the advertisement of the new and revised edition of the National Dispensary which appears in this issue. This edition is now ready and the book is a magnificent imperial octavo volume of 1910 pages with 320 engravings. Price \$7.25 cloth, \$8 leather.

Foote & Jenks note an evidence of returning prosperity in an increase of mail orders recently received, especially from wholesale druggists. Business through their salesmen is also improving. The "Eastern Star" occupies a prominent place on most of the orders.

The Wilson Ear Drum Co. are manufacturers of a new invention called Wilson's Common Sense Ear Drums which are claimed to relieve deafness and other defects in hearing. The drug trade is invited to investigate this appliance with a view of supplying the public. Write for pamphlet.

In the last issue of our Druggists' Directory we classified the Sagar Drug Co., Duluth, Minn., as wholesale and retail druggists. This, they inform us, is an error. They are an exclusive jobbing house, and have no intention to retail, nor have they any facilities for carrying on that branch of the drug business.

Have you ever figured upon the question of buying your Refined Tar and Oil of Tar, direct from the producer and estimating the amount of money that can be saved by so doing? Correspondence with Hansen & Smith, Wilmington, N. C., will bring you some facts and figures upon these points.

The partnership heretofore existing between Benjamin D. Miner and Henry H. Elbreg, manufacturers of physicians' chairs, at Indianapolis, Ind., has been dissolved and the business will hereafter be continued under the same firm name by Benjamin D. Miner.

What Charles Allen Reed has to say about his Calisaya La Filla in his advertisement in this issue is quite interesting to the drug trade. Mr. Reed is quite willing to supplement his arguments with prices, which he will be pleased to send upon application.

If you are thinking of buying a tablet machine, you should not fail to investigate the "Keystone" machines, manufactured by A. Leggoe & Co., Philadelphia, Pa. They have a capacity of from 75 to 100 tablets per minute, and are made in different sizes for both hand and power. Send for circular and price list.

The Folding Paper Box Co., of South Bend, Ind., are quoting prices on carton and paper box work which are low enough to call for investigation on the part of the drug trade. They are increasing their plant and trade, and are always pleased to submit samples of their goods and name prices on anything in their line.

A saving of one thousand per cent is just ten times better than the Dutchman's famous one per cent. The former is what the druggist can save by using the simple apparatus manufactured by the American Triturate Mold Co., 1130 South Twelfth street, Philadelphia. See their prices, and figure it out yourself, and then make your own tablet triturations.

The seventeenth edition of the United States Dispensary is now ready for delivery. It has been thoroughly revised upon the basis of the new U. S. P., 1890. The new book contains 1,950 pages, but the price remains the same as for previous editions, cloth \$7, sheep \$8. Address the J. B. Lippincott Co., 715-717 Market street, Philadelphia, for full particulars.

The New Peck Cash Register advertised in this issue of the Era is recommended as being especially suitable for the prescription department. The price is \$25, and an investigation of the merits of the register will be quite convincing as to the benefit to be gained from such an investment. Write for detailed description.

Billings, Clapp & Co., manufacturing chemists of Boston, say that their specialty, Iodide of Lime (Nichols'), is meeting with an unprecedented sale this winter, and they express the hope that every pharmacist who has a call for Iodide of Lime, will remember that this is a special preparation, entirely distinct from Iodide of Calcium, and will secure it in original packages through the wholesalers.

BETTER THAN REPRESENTED.

Mr. J. H. Janes, a prominent horseman at Windsor, Mo., writes under date of January 28 as follows: "Having used two bottles of Quinn's Ointment, I herein inclose \$1.50 for another bottle. I have found it to be as represented and even more." This is the universal expression of the leading horsemen from Maine to California. For curbs, splints, spavins, windpuffs and all banches Quinn's Ointment has no equal. It will pay to carry it in stock, and if you desire advertising or will send the names of ten or twelve of your customers who are in the horse-breeding line, to Messrs. W. B. Eddy & Co., Whitehall, N. Y., they will forward them, without charge, trial packages.

French, Cave & Co., of Philadelphia, present an object lesson in their advertisement in this issue, which shows how the druggists' customers may act, and explains the reason therefor. Every druggist who will send them his label or business card will have labels and wrappers sent to him, showing how French's Sarsaparilla is put up.

The Sedlitz Powders put up by the Doane sedlitz powder machine have always been noted for their accurate weight, and the reputation of the manufacturer is a guarantee of the purity of the chemicals used. Prices and samples of these powders will be furnished upon application. Address Chas. R. Doane, 22 Meserole street, Brooklyn, N. Y.

Every manufacturer of pharmaceutical specialties or apparatus who desires to introduce his goods in England should correspond with Rankin & Co., 7 Snow Hill, London, E. C., whose advertisement appears in this issue. They make a specialty of such business, furnish English and American references, and guarantee accounts.

In spite of the alleged hard times Chas. P. Whittle, manufacturer of druggists' furniture, Boston, Mass., has had work enough to keep his force busy. Among his recent productions are a lot of table tritrate cases in oak for the E. L. Patch Co., Stoneham, Mass. Both the manufacturer and the present owners have reason to be proud of these cases, and druggists who desire anything in this line should write Mr. Whittle for prices and designs.

Henry C. Blair, Walnut and Eighth streets, Philadelphia, calls the attention of the trade to his Eureka Shield for vaccinated arms, which needs but to be seen to be appreciated. It affords protection against all chafing from clothing and chance blows. It is securely held in place over the vaccinated part by tapes passing around the arm, fastening to the undergarments. Write for prices and detailed information.

A preparation which will exterminate bedbugs, roaches, and other insects, and at the same time is non-poisonous to human kind, is one which the drug trade can handle with advantage and profit. Such a preparation is supplied by the Iron City Chemical Co., Pittsburg, Pa., under the trade-marked name "Bugine." They furnish plenty of advertising. See list of jobbers who handle it in this issue.

The advertising matter furnished by Mrs. Gervase Graham, 1355 Michigan avenue, Chicago, will be of considerable interest to the lady customers of the retail druggist. Cucumber and Elder Flower Cream has proven to be a good seller wherever attention has been called to it in this manner. Remember that Mrs. Graham pays transportation charges upon the smallest order.

The season will soon be at hand when a sheet of sticky paper with files upon it will be a familiar and satisfactory spectacle. It will be satisfactory if the right kind of paper is used, otherwise it will not be. If the druggist desires to handle a paper which has a popular name, and is besides true to the name, he will not forget to specify "Tanglefoot" when ordering.

The Philadelphia Ornamental Wire Co., 18 N. Sixth street, Philadelphia, make wire display stands for the drug and perfumery trade, and they also make their ware from original and artistic designs. Their catalogue proves this, and everyone interested in such goods should send for a copy of it. It can also be obtained from their western representative, J. W. Dickerson, 72 Wabash avenue, Chicago.

Atwater, Armstrong & Clark, of Rochester, N. Y., who are extensive manufacturers of wood packing boxes for patent medicines, wines, liquors and mineral waters, have recently added improved machinery to their plant, and are now in a position to supply any quantity (lettered) upon short notice. Their capacity is 10,000 patent locked corner boxes per day. A postal card to the above firm will bring you quotations upon any quantity desired.

Are you receiving the prices current of the Morley Drug Co., 57-59 Franklin street, Chicago? They handle a full line of chemicals, and are agents for the Connecticut Witch Hazel Co., Gilpin, Langdon & Co., Orlole Tablet Machine, etc., and will be pleased to furnish complete price lists with quotations for large and definite orders for immediate or future delivery.

Wm. R. Warner & Co., manufacturing chemists, Philadelphia, offer a handsome case in either walnut, antique oak or cherry finish, free with orders for their pills, granules, effervescent salts or paroules amounting to \$50 net. These cases present a very handsome appearance and are an ornament for any drug store. Write for illustration of this case and other information regarding the offer.

Saratoga Victoria Spring Water is popular both as a table water and as a medicinal agent. It is a healthy, refreshing beverage, and has a decided curative effect upon indigestion, dyspepsia and diseases of the kidneys. It is sold in bottles only in cases containing 100 pints, or 50 quarts, allowance being made for empty bottles returned. Write for discounts to the trade, which allows the dealer a very liberal profit for handling.

Business is improving. There is no mistake about it. This is what Frederick F. Ingram & Co., of Detroit, Mich., say, and they base their statement upon the fact that they have been compelled to work nights to fill their orders. The retail drug trade evidently believes in being prepared for the spring trade by having on hand a reliable line of non-patents. The popularity of Wing's perfumes is also evidently on the increase.

THE PLACE TO DINE IN NEW YORK CITY.

Business men visiting New York City are beginning to find out that one of the cosiest places to get a good dinner, with everything of the best, is the old restaurant, formerly Heckman's, now called the "Century," at No. 122 William street, in the center of the drug district, which has changed hands and is now run in first-class style by one of the best caterers in the city. There has been a restaurant in this building (the oldest in the city) as far back as the memory of the oldest inhabitant can run. Many of the leading business men, who are particular regarding their meals, may be seen regularly at this old hostelry.

As all the prominent wholesalers handle Theodore Metcalf Co.'s sachet powders it is a comparatively easy matter to include a trial lot in your next order for general merchandise. These goods are already favorably known to the public, and this firm's trade-marked sachets, "Forget-me-not," "Drop of Dew" and "Boston Orris" are especial favorites with a large circle of the lovers of fine perfumes. Write for price list.

Send to E. P. Hall, Erie, Pa., for order blank for 500 rulers free, with your advertisement on both sides. Also ask for a blank sheet for twenty-five names. The sending of these names will result in your friends and customers receiving free a 5-cent sample of Hall's Erie Catarrh Remedy, which retails for 50 cents per bottle and they will be referred to your store for further supplies. Retailers make a good profit on this remedy.

Interest the doctors, and you can boom your prescription trade. J. M. Groavener & Co., 105 Milk street, Boston, tell in a very clear manner in an advertisement in this issue just how it can be done. Send for samples of Konaels, an improved method of administering powdered drugs, taking the place of capsules, cachets and wafers. Unique advertising matter is also furnished which never fails to call the attention of the physician to this new invention.

SPONGE BASKETS.

The above illustration shows an article which should have a place in every drug store. It is sold at a reasonable price, \$4 50, and is but a sample of the many articles of this kind made by the Cincinnati Mfg. Co., Cincinnati, O. This company is out with a new supplementary spring catalogue of brushes and wire goods which they will be glad to send to druggists upon application. They are making special efforts for the drug trade and their catalogue not only shows a wide range of articles particularly suited to the drug trade, but the prices are such as will command attention.

In fitting up a store durability as well as beauty should be considered. The Kinnear & Gager Co., of Columbus, O., manufacture steel ceilings which combine both of these features. Any druggist who contemplates making a change in the interior arrangement of his pharmacy should obtain catalogues and prices from this firm and figure upon the utility and economy of their product.

The Akron-Canton Stoneware Agency, 226 Lake street, Chicago, are manufacturing a Bristol-ware white, glazed jug, which does not leak, is uniform in size, corkhole, and capacity. The price is \$1 per dozen for gallon size, 85 cents for half-gallons, f. o. b., Chicago. For strong chemicals and high grade liquors these jugs are claimed to be superior to anything on the market. Trial orders are solicited.

Symphorol is the name of a new diuretic lately introduced by Farbwerke vorm. Meister Lucius & Bruning, Hoechst a. Main, Germany. It is the trade name for Caffeine-sulphonic acid, which is exhibited in combination with sodium, lithium, and strontium. Full information regarding the therapeutics of these new combinations can be obtained by addressing Schulze-Berge & Koehl, sole agents for the United States, 79 Murray street, New York.

When your customers start upon their annual pilgrimage next summer for the mountains or seaside, tell them that you can fill their favorite prescriptions for them just the same as if they were at home. But you will have to make some preparation if you intend to do this. You will need mailing cases, and the proper thing to do is to send right away for price lists and circulars of the United States Mailing Case Co., 40 Water street, Boston, Mass.

Schulze-Berge & Koehl, New York, sole agents for Benzosol, announce that owing to the increasing employment of this compound as a remedy in phthisis the manufacturers have decided to reduce the price of the drug so that it will be within the reach of those of limited means. After March 1, 1894, the prices will be as follows: In 25-ounce lots, \$1 per ounce; in 10-ounce lots, \$1.05 per ounce; in less than 10-ounce lots, \$1.15 per ounce.

Hinds Honey and Almond Cream owes much of its popularity to the skill exercised in compounding the preparation. It is a perfect emulsion and has none of the oily characteristics which distinguish so many similar compounds. The manufacturer, A. S. Hinds, Portland, Me., introduces the preparation by sampling, so the public can judge of its merits before purchasing. He has a special offer in this connection, which will be to the advantage of the trade to investigate.

WORLDS FAIR PICTURES.

Later parts of the Michigan Central's World's Fair Portfolio fully justify the claim made upon the publication of the first number, that it was the best, the finest and the most artistic of popular publications on the White City.

Each part contains sixteen (16) large plates and is sold for only ten cents. If you haven't seen it, the nearest Michigan Central ticket agent will show it to you, or you can write to O. W. Ruggles, G. P. and T. Agent, Chicago.

If you are not an expert in determining the purity of white lead your only safe course in purchasing such goods is to buy from a firm whose reputation is established for furnishing a pure article. It is hardly possible that the Eagle White Lead Co. could have carried on a successful business for fifty years without having quality in their goods to sell them. There is a good deal in this point and it should be remembered when the time comes for buying such stock.

Have you noticed the latest offer of Geo. W. Holloway, 807 N. Sallina street, Syracuse, N. Y.? He now offers to send, upon receipt of \$2, freight prepaid, 1 dozen Holloway's Herb Tea, and 1 dozen Dr. Stone's "Ulmiset," the great cough remedy. These articles retail for 25 cents, so that an investment of \$2 brings a return of \$6. As to selling these preparations, he sends 250 samples of the tea, the distribution of which always creates a paying demand for the goods.

Every druggist who has a soda fountain is now looking for soda syrups. Here is a formula which is recommended by Duroy & Haines, of Sandusky, O. Take Duroy Port Wine, 2 pints; acid tartaric, 2 ounces; syrup simplex, 6 pints and tinct. cudbear or caramel sufficient to color. Fill the glass one-fourth full of the above syrup; then draw it full of soda water, and you will have one of the finest drinks known. Order a 6-gallon keg of Duroy Port and try it.

The Erie Chemical Company has been organized at Erie, Pa., with a capital stock of \$50,000 for the manufacture of chemicals from alkali products. The Le Blanc process will be used, and James G. Mackenzie, who has been identified with similar industries at Bristol, England, will superintend the manufacturing department of the new firm. Soda ash and bleaching powder will engage the attention of the company at first, but it is the intention in time to extend the business to include other allied products.

Do you put up any preparation or manufacture any of the official preparations which call for licorice mass? If you do MacAndrews & Forbes, 55 Water street, New York, can interest you. Their pure licorice mass is manufactured from roots gathered in the Orient, which are claimed to be richer in glycerhizin than those of any other country, and their product has given universal satisfaction wherever used. Write for quotations on one of their original trade-marked packages, and see if they cannot save you some money.

The J. Hungerford Smith Co., of Rochester, N. Y., call attention to three important commodities to the drug trade in their advertisements in this issue. The goods are all seasonable. "Sure Catch" sticky fly paper for 1894 shows many improvements, and the patent Penny Holder is offered as the cheapest, and most practical device yet invented for handling sticky fly paper.

Another novelty is "True Fruit" Pepsin Chewing Gum, with patent alarm box. This latter feature is proving exceedingly popular with the trade.

Druggists who own soda fountains will also find something of interest in "True Fruit" fountain syrups, and the manufacturers ask for a trial order to convince of their superiority.

The fluid extracts manufactured by Irwin, Kirkland & Co., the well-known chemists of Decatur, Ill., are of elegant appearance and reliable quality. They are prepared from select drugs by their improved process, and are guaranteed the best in the market.

The W. J. M. Gordon Chemical Co., of Cincinnati, O., transferred their glycerin exhibit from the World's Fair at Chicago to the Mid-Winter Fair at San Francisco, where it is making a handsome display in Manufactures Building, Avenue E. Since the close of the Columbian Exposition this company attach to all their cans or other packages a facsimile of the official blue ribbon, showing that their brand received first honors at the hands of the committee on awards.

All the standard pharmaceuticals are manufactured by Menn & Stubenrauch, 83 John street, New York, and their catalogue will explain their position as to making fluid extracts to conform to pharmaceutical standards. They are also sole agents for Pepsinum Purum "Byk," and Dr. Auerbach's Peptonized Infant Food, which are both meeting with considerable commendation from the medical profession. Their discounts are liberal, and they solicit correspondence regarding prices, methods and products.

Foote & Jenks have decided to maintain the No. 608 style at the reduced price of \$1.50 per 8 oz. bottle, or \$3 per pint for all staple standard odors, such as White Rose, Crab-Apple Blossom, Jockey Club, etc. Their special and trade-marked perfumes in this style are \$1.75 per bottle or \$3.50 per pint for Linden Bloom, Eastern Star, Pythian Bouquet, Santa Maria, Violet and Black Pansy. Their Tonquin Musk and Extra Frangipanni are \$2.50 per 8 oz. bottle or \$5 per pint.

SOME SODA FOUNTAIN FIGURES.

A sixteen-page folder, exquisitely designed and printed in two colors, has been issued by J. W. Tufts, as an advertisement of his soda fountains, bottling apparatus, etc. It appears that this house sold 27,000 pieces of marble apparatus in the last thirty years, 1,250 going to foreign countries. Of late years the average annual sale has been 1,400. Here is a list of sales by states and countries, showing that the goods of Mr. Tufts' make are in demand everywhere: Alabama, 268; Arizona, 10; Arkansas, 285; California, 405; Colorado, 293; Connecticut, 469; Delaware, 39; District of Columbia, 236; Florida, 303; Georgia, 486; Idaho, 34; Illinois, 1,718; Indiana, 894; Indian Territory, 25; Iowa, 787; Kansas, 791; Kentucky, 492; Louisiana, 192; Maine, 373; Maryland, 495; Massachusetts, 3,536; Michigan, 1,070; Minnesota, 500; Mississippi, 237; Missouri, 837; Montana, 43; Nebraska, 460; Nevada, 10; New Hampshire, 367; New Jersey, 386; New Mexico, 22; New York, 2,704; North Carolina, 247; North and South Dakota, 238; Ohio, 1,585; Oklahoma, 3; Oregon, 77; Pennsylvania, 1,014; Rhode Island, 321; South Carolina, 178; Tennessee, 366; Texas, 857; Utah, 52; Vermont, 208; Virginia, 626; Washington, 68; West Virginia, 178; Wisconsin, 435; Wyoming, 23; Quebec, 56; New Brunswick, 58; Newfoundland, 2; Nova Scotia, 34; Ontario, 303; Prince Edward Island, 3; Manitoba, 10; British Columbia, 1; Mexico, 12; Central America, 21; West Indies, 3; Hawaiian Islands, 1; other foreign countries, 1,249; grand total, 27,023.

Among the novelties designed to attract people to the soda fountain are the Ideal Tumbler Holders, manufactured by the John C. Johnson Soda Apparatus Co., 224 N. 13th street, Philadelphia. Their elegant appearance renders them appropriate adjuncts for the finest soda fountain, while their practical utility makes them exceedingly useful to the dispenser of the great summer beverage. A sample will be mailed for \$1.35, the regular price per set of six being \$7.50. See advertisement in this issue.

A. Guckenheimer & Bros., distillers, Pittsburgh, Pa., are sending to druggists and physicians of the United States, a very neat embossed folder printed in gold and colors, containing the testimonial of the Board of Judges on Liquors of the Columbian Exposition. As the twenty samples of ten ages exhibited by this firm averaged 99.1-4 points out of a possible 100, Guckenheimer's Pure Rye is one which will interest members of the drug trade, who desire a superior article for dispensing purposes.

As the Fuller & Fuller Co., of Chicago, guarantee the quality, and put their name upon a cigar called the "Flor de Fuller," the retailer who orders a half thousand is reasonably sure of getting a satisfactory cigar, and is also quite sure that the offer of an Improved Imperial Sponge Holder, free with each order, does not detract from the quality of the goods, but is simply what the firm is willing to pay to get the retailer interested in this particular brand. It certainly pays to become interested in "Flor de Fuller."

A balance which dispenses with steel or agate-knife edges, with their necessary friction, certainly presents many advantages over the ordinary forms. The Springer Torsion Balance Co., 92 Reade street, New York, manufactures scales which are free from these disadvantages. They will be pleased to send, when requested, price list and copy of Franklin Institute's report upon their goods, also a description of their improved balance beam graduated to show metric, troy and avoirdupois weights.

Have you tried the Improved Tooth Powder Bottle No. 69, manufactured by John M. Maris & Co., Philadelphia? The only objection you can possibly have to this bottle, is that it is economical for the consumer, but this disadvantage (?) is more than compensated by the fact that the customer always comes back to you to have the bottle refilled, and does a good deal of advertising for you in showing other people how nicely it works. If you haven't seen this bottle send 10 cents for sample, which will be mailed you.

Notwithstanding the general depression of business throughout the country, The Bradley Mfg. Co., of New Haven, Conn., report that the demand for their product, The Bradley Ice Cream Cabinets, has begun earlier this season than usual, and that the prospects for largely increased sales are very bright. These cabinets are certainly a very fine thing, and are now recognized as a necessity in the ice cream soda business, while their Delivery Cabinets for family use are among the best known contrivances for the purpose on the market. Full information upon these seasonable specialties should be in the hands of every owner of a soda fountain. Write for description and prices and mention the ERA.

As Beach & Claridge, of Boston, pay particular attention to the wants of the soda water trade it is quite proper for the drug trade to pay attention to the fruit juices and other soda water specialties which this firm have upon the market. They have been successful for years past in pleasing many soda dispensers, and their success has not been built up on poor or inferior goods. Their catalogue and formula book is just what you want for the coming season. Send for it.

Raymond & Co., of Brooklyn, N. Y., advertise on page 7 to present you one-half dozen of their Pectoral Plasters. If you are alive enough to send them the names of one hundred heads of families. If you are thinking of sending in a list it will pay you to take a little pains with it, and put in the names of people you know to be good customers. Then the advertising matter which Raymond & Co. send to these people will sell the goods, and you will be in pocket one dollar and fifty cents.

The catalogue which the John Matthews Apparatus Co., First avenue and 26th and 27th streets, New York, are sending out this season is a very handsome volume printed upon fine plate paper, bound in muslin, with cover design printed in silver. It contains a fine half-tone portrait of the late John Matthews, who established the company in 1822, gives several views of the company's offices and factories in New York City, and shows a large number of illustrations of the different designs of apparatus for which the firm is justly famous.

The name of Dr. Henry A. Martin has always been prominently identified with the history of vaccination in America, and his particular product of vaccine virus has always enjoyed a favorable reputation with the medical profession. The business which he established and successfully conducted for nearly twenty years is still continued by his only surviving son, Dr. Francis C. Martin, Roxbury Station, Boston, Mass. The drug trade will find something of interest in his advertisement which appears in this issue, and will do well to investigate the liberal terms which he offers.

It is an easy matter to sell goods when they are of high quality, have an attractive name, and are put up in artistic style. The public has a natural preference for such goods. Duquette & Co., of Council Bluffs, Ia., are quite well aware of this fact, and the above are the reasons for the existence and success of their Pomona Fruit Juice Tablets. They have 24 flavors and pack their goods in square flint glass bottles holding four pounds net. The leading jobbers handle them, and the manufacturers will be pleased to send prices to the trade.

J. M. Grosvenor & Co., 106 Milk street, Boston, have succeeded, in a very gratifying manner, in getting the public interested in Bell-Cap-Sic Plasters and Kremlin Cream. They have done this by unique methods of advertising, and in offering goods which support every claim made in their advertising. This is the class of goods which druggists can sell, or rather can take in the money for them, as they come about as near selling themselves as any goods upon the market. If you haven't received a sample of Kremlin Cream send for one.

The druggist who realizes that his interest and that of his medical patrons depends upon the quality of the goods he keeps, knows that it does not pay to keep anything but the best. It is quite often the case that results are not satisfactory from the use of ordinary oil of sandalwood, and in such instances Dodge & Olcott, of New York, recommend a trial of their "D. & O." brand, which they guarantee will produce all the therapeutic effects which a pure oil of sandalwood can. Try an original 4-ounce bottle. All jobbers have it.

The reduction in price of that most popular book of soda water formulas and hints to dispensers, Saxe's New Guide, is keeping the publishers quite busy filling orders and it is expected that the rush will continue for the next ninety days. The reduction from \$5 to \$3 places the book within the reach of all druggists who dispense soda water. Parties intending to buy should not delay sending in their order, for by purchasing now they will have time to digest the good points in the book, and when the soda season opens will be prepared to increase their trade over any previous season.

The public is perfectly willing to buy at a reasonable price anything which will add to the effectiveness of interior house decoration. People are interested in such matters and the tendency of the times is unmistakably in that direction. The drug trade will therefore do well to investigate the merits of "Gypsaïne," manufactured by the Diamond Wall Finish Co., Grand Rapids, Mich. This product is adapted for both plain and relief decorating and coat after coat of it can be applied indefinitely. Send for tint cards and copy of the Gypsaïne Advocate.

The advertisement of J. J. Fleck, Tiffin, O., which appeared in the issue of February 15, was certainly of a character to excite interest in the German Easter Egg Dyes manufactured by him. Through an unfortunate omission on the part of the ERA the offer was not made strong enough. Mr. Fleck not only sends a sample of his dyes free, but he also sends a price list and descriptive circular of several outlines showing how the retailer can procure 50 five-cent packages of the dyes retailing for \$2.50, free of charge. Let him have your name on a postal card.

Morrison, Plummer & Co., wholesale druggists, Chicago, believe in fair play. They are decidedly against the policy of pricing one thing at cost, and making up the deficiency on something else. Such a course necessarily confuses the buyer as to the general market value of goods, and is an encouragement to him to make retail prices which the true market prices will not enable him to maintain. This situation is quite apparent when it comes to making quotations upon goods of the season, and they invite correspondence regarding articles for the spring trade, with the assurance that prices quoted will be based upon quality.

MAP OF THE UNITED STATES.

A large, handsome map of the United States, mounted, and suitable for office or home use, is issued by the Burlington Route. Copies will be mailed to any address, on receipt of fifteen cents in postage, by P. S. Eustis, Gen'l Pass. Agent, C. & Q. R. R., Chicago, Ill.

Charles Gordon Buck, Chicago, calls the attention of the trade to his latest product, Arnica Mutton Suet. The curative properties of mutton suet have long been known, but the presence of extraneous irritating matter has been an obstacle in the way of its extended use. Mr. Buck's process of purification and combination with carbolic acid and arnica make his preparation one which quickly attracts the attention of the medical profession, and all those who work in the sick room. As a family salve it is meeting with great success. For prices and terms see "ad" in this issue.

One Graves Brush Rack, costing \$9 or \$10 according to size, will take care of all the brushes you will sell during your lifetime, and your heirs or successors will find it a valuable asset when you go out of business. It keeps brushes in such a manner as to prevent marring of backs, and breaking of bristles, and pays for itself in a short time. Ten dozen brushes can be displayed by it in a counter space of 19x22 inches, and customers can examine the goods with ease and satisfaction. Write to the Graves Brush Rack Co., Rome, N. Y., if further particulars are desired.

Nearly every druggist is prepared to admit the practical utility which attends the use of empty elastic capsules for fluids when the question of extemporaneous dispensing of such medicines comes up. The members of the medical profession are also right in line on the question from their own particular standpoint. The Merz Capsule Co., of Detroit, not only advocate the same ideas, but they also treat the question from a financial standpoint. Their figures are quite convincing upon this latter point, their claims for the saving of a certain percentage being founded upon some very straight figuring, which they will gladly furnish upon application.

The company which prepares Dr. W. R. Amick's chemical treatment for pulmonary diseases has established a New York depository at 114 Fifth avenue. This move is necessitated by the constantly increasing demand upon the Cincinnati laboratory made by the physicians in New York and vicinity. The depository is simply a supply bureau for the profession, obviating the inconvenience and expenditure of time incidental to procuring the preparations from Cincinnati. The offer to all physicians of sufficient remedies to give a fair trial in each case, without charge will be continued, and test packages may be obtained from the New York depository.

The man who is disposed to spend any money at all for a tumbler washer should make it a point to get the best to be had. Convenience should be regarded as a commodity to be duly paid for. With this idea in mind the New Automatic Tumbler Washer manufactured by L. L. Rowe, 16 Howard street, Boston, will be regarded as a paying investment. These washers are provided with a brush attachment of such form as to insure contact with every part of the inside of a soda or mineral water glass. This removes all cream which is then carried away by forcible jets of water, which also thoroughly rinse the glass. Write for prices on these conveniences.

Chicago, Ill., Feb. 14, 1894.

H. D. Cushman, Three Rivers, Mich.:

Dear Sir—In sending my order for a half dozen more inhalers I am pleased to say, that, with the use of one inhaler my son has been cured of catarrh, of which he has been troubled since infancy. I have used atomizers and consulted first-class physicians, also have taken him to Colorado, but nothing would relieve him until I began using your inhaler, which he has used continuously until cured. It has saved me many dollars, and I recommend the same not only for its goodness, but also for its cheapness.

Respectfully yours,
JULIAN BROMILLET.
17 Selden st., Chicago, Ill.

The Wm. S. Merrell Chemical Co. are entitled to the credit of introducing to the medical profession and drug trade, the perfected form of fluid medicines sold by them as Green Drug Fluid Extracts. These preparations are distinctive, not only as to physical appearance, but in respect to their permanency and therapeutic value. They contain a minimum per cent of the inert and non-medicinal constituents of the drug from which they are prepared, and are claimed to represent the active medicinal principles to a greater degree than any other competing line of fluid medicines. In accuracy of dosage, and in cleanliness, and in dispensing economy, they commend themselves to the judgment of practitioner and dispenser alike.

Shoddy goods are made by shoddy houses. The best test of the quality of any goods placed on the market is the business standing of the manufacturer. If the house is responsible, it is fair to presume that the goods are what they are represented to be. A case in point is that of Clarke's Pure Rye Whiskey. The mere fact that it is distributed by Messrs. Colburn, Birks & Co., of Peoria, Ill., is sufficient guarantee that the whiskey is all that is claimed for it. This firm, who have been in business for thirty-one years, could not afford to attach their name to an inferior quality of goods, and that they have been successful in pushing this brand of whiskey is attested by the increasing number of orders their house is receiving daily. Clarke's Pure Rye is certainly the peer of any whiskey made in this country.

The receipt on February 14 of a square packet wrapped and sealed with a red ribbon device, and bearing the inscription "To be delivered into ye hand of D. O. Haynes & Co., in ye faire Citie of Detroit, these greetings," naturally awakened a suspicion that a pictorial representation of some of the foibles or weaknesses of editors and publishers was at hand. An agreeable disappointment was found in the following:

To you, greeting on this
Saint Valentine, his day.
Oh, ye! of mortar and of pestle,
Who many a time and oft do wrestle
With hasty scrawls of those M. D.'s,
Who do not 't is and cross not 't';
If you've invented for each Ill
Something prepared with care and skill,
And long to win—as Valentine—
Fortune, that fickle maid divine,
Come hither straight! My aid you'll prize—
To win her you must Advertise!

At ye figure of A. L. Hummel, M. D.,
Medical Journal Advertising, 257 South
Fourth street, Philadelphia, Pa.

It is said that a man is known by the company he keeps, and the saying is undoubtedly true, but a druggist is only favorably known by the goods he keeps. If he desires to keep in line with the opinions of the judges at the Centennial, Paris and Columbian Expositions, and of the general public as well he will always be careful to specify "M. & R." when he orders his licorice. Mellor & Rittenhouse do two things in the manufacture of their specialty. They put their goods up in an attractive manner, and in convenient packages for handling and ordering, which pleases the drug trade. Then they put quality into their goods, which pleases the public. M. & R. licorice is the kind to handle for all-round satisfaction.

A comparative study of the soda water business of the present, and that of but a few years ago shows an improvement which would astonish the prophets of two decades ago. In considering the present stage of development there are many features which may be classed as strictly new, and the Ash Soda Fountain Co., 207 S. Canal street, Chicago, have something in this line to which they call the attention of the trade. Their apparatus with removable horizontal or upright syring jars, with recess, embody certain advances in construction which should be studied by all owners of apparatus. Their prices and terms both in sale and exchange are extremely reasonable, and prospective buyers should have their catalogue and price list before buying.

Ordinarily a sieve is a sieve, but no druggist ever used one without feeling that he would use something better if he knew where to get it. It is this demand for something better, even in commonplace utensils, which has caused Withall, Tateum & Co., manufacturers of glassware and druggists' sundries, Philadelphia, to attempt something better in sieves. They believed that the same material, and the same number of hours of labor could produce an improvement in this article without an appreciable increase in cost. They have accomplished such a result, and are now offering brass wire sieves with lacquered tin frames at nearly the same prices which are charged for the ordinary wooden frame sieves. They describe these goods in an advertisement in this issue and also call attention to some other articles in which the idea of improvement is strikingly illustrated.

The Connecticut Witch Hazel Co., 132 Nassau street, New York, make the following quotations on their special product, "Hazel Bloom," f. o. b. Chester, Conn., New York City, Albany, N. Y., or Chicago, Ill.: Barrels, 55 cents per gallon; half-barrels, 58 cents per gallon. Bottled goods per gross as follows: 4 ounce, \$10; 6 ounce, \$12; 8 ounce, \$13; 12 ounce, \$14 50; 14 ounce, \$17 50; pints, \$19 50; quarts, \$30. The bottled goods are put up in original packages as follows: 4, 6, 8 ounces 1 gross lots; 12, 14, 16 ounces in half-gross lots, and quarts in one-fourth gross lots. No charge is made for containers and the bottled product is furnished complete with label and wrapper. See list of selling agencies on another page to whom orders should be sent and prompt attention will be given to shipment. Special prices will be quoted on carload lots, and full discounts given to jobbing and wholesale trade.

EASTER.

The celebration of Easter is as old as Christianity. It takes its name from Oster, rising, or as has been claimed, from the Saxon deity Eostre, whose festival is observed at the vernal equinox. The time of its celebration varied in the early churches, those in Asia Minor keeping Easter on the day of the Jews' Passover, the middle of the Jewish spring month Nisan, while the rest of the small Christian world celebrated the resurrection on the Sunday following the festival of the Passover. The bishops of the ancient churches, including the venerable and immortal Polycarp, sought in vain to adjust these differences, and the Paschal controversy, as it was called, lasted for several centuries, until the Emperor Constantine had a canon passed in the Council of Nice, A. D. 325, providing for the celebration of Easter "everywhere on one and the same day," according to the rule still given in a condensed form in the prayer book, "Easter Day is always the first Sunday after the full moon, which happens upon or next after the twenty-first day of March, and if the full moon happens upon a Sunday, Easter Day is the Sunday following."

The earliest Easter custom recorded was the universal salutation of the primitive Christians on Easter morning, "Christ is risen," to which was answered, "Christ is risen indeed." The idea that the sun dances upon Easter morning comes down from this early period. Distributions to the poor, of food and clothing, were among the Easter celebrations of the early church. Very ancient is the unaccountable custom of the clergy and laity together tossing balls in the churches at Eastertide, for tansy cakes, the later mingling of bitter and sweet symbolizing the great fast and festival days of the church, Good Friday and Easter.

After the twelfth century outdoor games seem to be special features of the occasion. Football was one of these, the city mayors, wardens and other officials, in full insignia of office, marching in procession to the scene and taking an active part in the amusement. In the time of Henry VIII. this was superseded in England by foot races, the former pageantry replaced by a procession of horsemen, each carrying a spear adorned with a wooden ball and garlanded with flowers.

Archery was another favorite Easter pastime, the sheriffs of contiguous towns choosing sides from among the yeomen "to the number of twelve score," when followed the shooting for the championship, and a "breakfast of calveshead and bacon." The contest over, they marched in procession to the town hall to share the breakfast, the winners, as hosts, leading the way, carrying their victorious arrows without the bows, and the losers, as guests, following, bearing their bows without the arrows.

"Lifting" was a curious custom or amusement for Easter Monday, in these old times. Crowds of young men in holiday attire and provided with chairs adorned with white ribbons and flowers, paraded the streets and entered houses, in their search for pretty maidens, who were expected to seat themselves in the chairs and be lifted as high as strong arms found possible, for which performance, on alighting, a kiss was demanded by each gallant, custom forbidding its refusal. On Easter Tuesday the order of exercises was reversed, the women then buying the

same privilege. History records a fine of £100 paid by Edward I. to escape being "lifted" from his bed by some of his admiring female subjects, for even royalty itself had to conform to the absurd custom or pay dearly for refusal, this lifting or raising up originally typifying the Resurrection, and therefore demanding universal respect, childish and absurd and far-fetched as was the manifestation from the idea it originally represented.

Easter was in these early days the minstrels' special holiday, and Easter hymns and carols floated from every hill and valley, the singers gathering in a rich harvest from the pennies of the peasants and the gold and silver of the gentry and lords of high degree.

Among all these strange and old-time Easter customs, eggs as a necessary and appropriate feature date back as far as any, and undoubtedly were originally used as a symbol of the Resurrection, the chick from the egg and the butterfly from the chrysalis being its universal and familiar types. They seem to have substituted for the balls used for tossing in the churches by bishops, priests and choristers, in the early Romish church.

In the thirteenth century we find it recorded that "eggs were in such demand at that season that they always rose considerably in price. They were boiled very hard in water colored with red, blue or violet dyes, with inscriptions or landscapes traced upon them by a rustic process of chemistry. They were offered as gifts to the "Valentines" of the year, or played with as balls, ball playing on Easter Monday being universal in every rank."

Bacon and eggs were long a standard Easter dish, the former probably used as a rebuke to the Jews, with a dessert, by way of concession, of tansy cake or pudding, which served as the "bitter herbs" commanded for the Paschal feast. Eggs and wine were given to the singers as refreshment in return for their Easter carols. Even in Scotland, where the festivals of the church had been pretty thoroughly suppressed, "the Pace or Pasche egg," hard-boiled and dyed, seems to have been a necessity to its young people, even in the Covenanter days.

In Switzerland, too, Holy Saturday is a time-honored festival, and groups of children, with baskets of colored eggs, still follow the singers on Easter Even, with pine-wood torches, and join in the carols and general rejoicing.

The custom of egg-rolling, which seems to be preserved in this country only at the national capital, is claimed to be English and to date back to children of the fourteenth century. Germany brings evidence of its being observed among its "Kinder" at a still earlier period, and it doubtless originated in the tossing of balls and eggs in the churches at a still earlier date. Whether German or English, it is evidently Washingtonian now, and no date in the calendar is more universally and enthusiastically celebrated than Easter Monday. The schools are all closed, and at an early hour the little ones are out in force. The government clerk, going to office in the morning, meets hosts of children on their way to the White House grounds, carrying the eggs which are a necessary feature of the day's festivities. In box or basket, or clutched carefully in eager little hands. It is a democratic gathering; the "curled darlings" of the rich, with their colored or French nurses,

and in some cases a footman following with the basket of luncheon, and the children of the poor, white and black, "all sorts and conditions of" children, "without regard to race, color or previous condition of servitude," but a general holiday atmosphere pervading all alike, on every street and from all directions hastening to the same destination, the spacious grounds surrounding the executive mansion, where the undulating surface offers decided advantages for the day's occupation of rolling Easter eggs.

Thousands of eggs are eaten on the grounds every Easter, and the alarming declaration of a colored nurse on the last occasion may be taken as a basis of facts for all, allowing some margin for the vivid African imagination and their always original method of expression—"I 'clar ter goodness, I would'n be noway s'prised of dis yer chile wuz ter die 'fo' maw'nin', fer she done eat ten aigs, shell'n' all."

Thus do the Washington children celebrate their egg-rolling festival, which is a day in their calendar not surpassed by Christmas itself, and with which the old-time May Day celebration furnishes but a modest comparison. Hundreds of children go to bed on Easter Sunday with the words, if not the lines, of Tennyson's "May Queen" as their last good-night:

"Oh, wake and call me early,

Call me early, mother dear;

To-morrow will be the happiest day

Of all the glad New Year."

It is a happy day, and a long one, and it is a tired-out little crowd that at sunset fill the cars and hercules, and dog-carts and coupes, or tramp away on weary little feet to near or distant homes.

By 7 o'clock the next morning a dozen workmen are busy removing the debris and all traces of the day's festivities, and the trampled grass is all that is left to bear witness to the residents of the White House and the promenade through its beautiful grounds, of the children's annual raid on Easter Monday.

The universal custom of using colored eggs for the Easter festivities has naturally led to the exercise of considerable ingenuity, not only in methods of coloring, but in the manufacture of dyes for this purpose. Heretofore various coloring matters either in bulk, tablets, sticks or in liquid form have been used, also sheets of paper with various designs in colors thereon, which were transferred to the egg by wrapping it in the paper and placing it in warm water. This year a decided novelty has been introduced, and it comes through the Paas dye Co., of Newark, N. J. It consists of sheets of paper by means of which pictures can be transferred to the eggs, and enthusiastic comments are already being made by those who have observed the artistic effects obtained by the use of this novelty.

"American nervousness," "Rush," etc., have at last been catalogued in the ever increasing list of modern diseases, and as a rival to appendicitis, we now have "Americanitis."

On page 28 of the Era Druggists' Directory, last edition, the name of E. J. Hussey & Co. appears as Drug Brokers. This they inform us is an error, as they should appear under the head of "Introducers of New Novelties of Merit."

SALESMEN FOR ROCHESTER CANDY WORKS.

E. RUNYAN.
H. C. FAY.

W. R. MOFFAT.
W. E. CARPENTER.

G. L. EMRICK.
W. H. PHILLIPS.

THE ROCHESTER CANDY WORKS.

From the fact that the finer grades of confectionery are now recognized as appropriate and profitable side lines for the retail druggist, considerable interest is manifested both in the manufacture of such goods and in the firms manufacturing them. The Rochester Candy Works, of Rochester, New York, are one of the foremost firms in the country catering to the wants of the drug trade, to which they are already quite well known through their fine chocolates and bonbons which are distinguished by the very appropriate trade name "The Delicious." The company is now located in an elegant five-story building at 407, 406 and 411 State street, where they have a floor space of 31,200 square feet, arranged and fitted with the most improved facilities and machinery to be procured, which places them in a position to supply all demands for the highest class of goods in their line. The above group represents the travelling salesmen of this firm. No extended reference to the personal characteristics of these gentlemen is necessary as the fact is well known that they are all able to speak for themselves and their

faces are tolerably familiar to the trade in the various localities through which they travel. G. L. Emrick covers the New England territory and eastern New York; E. Runyan, Virginia, North and South Carolina, Georgia, Florida, Alabama, Tennessee, Kentucky and Missouri; W. R. Moffat, Pennsylvania, Maryland and West Virginia; W. H. Phillips, northern central New York; H. C. Fay, western New York and part of northern Pennsylvania; W. E. Carpenter, Ohio, Michigan, Indiana and Illinois.

The officers of the company are C. L. Griffith, president; Chas. R. Parkinson, vice president; Frank Aylsworth, secretary; A. S. Colebrook, treasurer.

As far as practical utility is concerned, a drug store might be located in a barn, and soda water dispensed from a barrel. But the public wouldn't stand it. People now expect the finest, and will do their trading at the most attractive store. This is the reason why a druggist is compelled to invest so much in his soda fountain—the public wants it—and will pay for it. It only remains for the druggist as a care-

ful man to get the best possible results when he invests his money in such a manner, and it is to this careful class of men that the Low Art Tile Co., 952 Broadway, Chelsea, Mass., make their claims both as to the superiority in an economical way, and the artistic features of their apparatus. Intending purchasers should correspond with them before buying.

Do you keep Pinaud's perfumes? This question is asked of the druggist quite frequently. Nearly everybody who visited the World's Fair last summer visited the elegant salon of this firm in the French section, Liberal Arts building, and came away with delightful satisfaction after sampling "Aurora Tulip," "Acacia de France," "Paquita Lily," and other fine perfumes which Pinaud had upon exhibition there. As their memories go back to the great events of the Columbian Exposition the public easily recalls incidents of this sort, and the druggist who keeps Pinaud's perfumes is quite sure of a high class patronage. Remember, free samples of these perfumes can be obtained by addressing Ed Pinaud's Importation office, 42 East 14th street, New York.

THE MARKETS.

The fluctuations noted in this market report are those affecting goods in original packages and jobbing lots. A complete price list, showing quotations as made by jobbers to retailers, will be found upon another page under the head of "Prices Current."

Advanced.—Opium, Morphine, Codeine, Arsenic, Cocaine, Cacao Butter, Balsam Peru, Vanilla Beans, Spirits Turpentine.

Declined.—Cattle Fish Bone, Lithia Salts, H. G. 11. Oil Peppermint, Gum Camphor, Japan. Salol, Naphthaline.

New York, February 27, 1894.

There are no new features in the general condition of the market of sufficient moment to excite more than passing comment. The movement in the various lines is characterized as fair and trading has been confined mostly to small-lot orders. There is a marked absence of speculative interest and purchases seem to be made to conform as closely as possible to absolute wants. There is considerable encouragement, however, in the outlook, as the approaching season will bring demands for commodities not carried largely in stock, and this stimulation cannot help but improve the general tone of the market.

OPIMUM.—Still remains active, and values are tending higher, although there has been but little change in quotable prices. Considerable interest is manifested in the treatment which this drug will receive at the hands of the Senate in its work upon the Wilson bill, and until this can be definitely determined opium may be classed as a speculative commodity. It is understood that the greater part of the stock here is held by strong parties who are not to be frightened by reports from abroad, and are in a position to watch closely all legislative tendencies. The bulk of the stock is held at \$3.25.

MORPHINE.—Is rather scarce and in good demand. Manufacturers have lately advanced prices 10 cents per ounce and outside stocks are being sold at a slight premium.

QUININE.—Continues in good demand and seems to be developing strength, although there is not much change from previously quoted prices. Orders are mostly limited to jobbing quantities, the larger buyers having nearly all taken advantage of prices previous to the recent advance.

ALCOHOL.—Trading is confined to small lots, but the volume of business is estimated to be very near the usual proportions. Previously quoted prices for both wood and grain still prevail.

ERGOT.—Improvement in the jobbing demand is noted and former prices govern most transactions. German is quoted at 24 to 26 cents and Spanish at 23 to 20 cents, according to quality and quantity.

CODEINE.—Manufacturers have made an advance of 25 cents per ounce and the alkaloid is now quoted at \$4.50 in eighths, with sulphate at \$3.70.

BORAX.—A slight improvement in demand is reported, but prices remain at previous quotations.

ARSENIC.—Is firm and the demand is for small quantities only. White is quoted at 3% to 4 cents, and Saxony Red at 6% to 6% cents to quality.

BALSAM COPAIBA.—Is in fair demand and firm prices are being maintained upon the better grades. Central American

is quoted at 38 to 40 cents, Para 45 to 48 cents.

BALSAM FIR, Canada is in moderate demand and is quoted at \$3.75 to \$4 for small lots.

BALSAM PERU.—Prices are firm with only a small jobbing trade. Prices range from \$1.40 to \$1.55.

BALSAM TOLU.—The London market indicates a downward tendency, but prices here remain as previously quoted, with but a moderate jobbing demand.

CATTLE FISH BONE.—Competition has forced quotations upon this commodity to the lowest range known during the last quarter of a century. Trieste is now quoted at 10½ cents; broken at 7½ to 8 cents.

BRIMSTONE.—Is without much interest, although there are rumors of a combination among Italian producers to force prices upward. Resublimed is quoted at 1½ cents for roll, with usual discounts.

MENTHOL.—Seems to have reached the limit of high prices and a downward tendency is now noted. Quotations now range from \$5 to \$5.25.

LITHIA PREPARATIONS.—Have been reduced 30 cents per pound. Bromide is now quoted at \$2.60; benzoate, citrate, and salicylate at \$2.55; iodide at \$5.35.

CANTHARIDES.—Trading is limited to small lots, and holders are maintaining firm prices. Chinese is quoted at 28 to 30 cents; Russian at 70 to 75 cents.

CHLORATE OF POTASH.—Is dull and quotations are nominal. German crystals are held at 14½ to 14½ cents; English at 14½ to 14½ cents.

ASAFOETIDA.—Continues active with a good jobbing demand, quotations ranging from 28 to 30 cents.

KINO.—Supplies are limited and prices are firm.

CHICLE.—Recent arrivals have made the market dull and easier, and 27 to 28 cents seem to be the ruling quotations.

SENNA.—An upward tendency in foreign markets, especially for Tinnevely, is being felt here and prices are becoming firmer.

BUCHU LEAVES, SHORT.—Are in demand and previously quoted prices are being steadily maintained.

CROTON OIL.—Has been advanced and is now held at 85 to 90 cents.

OIL PEPPERMINT.—Is easy in demand and apparently tending lower. H. G. H. is quoted at \$2.80 to \$2.85; western, \$2.45.

OIL ORANGE.—Is improving in sympathy with advices from abroad. Quotations now range from \$1.35 to \$1.85 as to brand.

OIL LEMONGRASS.—Shows a decline and some quotations are made at 80 cents.

OIL CASSIA.—Is advancing as supplies of best grade are limited in the foreign market. 85 cents seems to be the inside figure.

CASTOR OIL.—Is in fair demand, although transactions are limited to jobbing quantities. Best grades are quoted at 14½ to 15 cents in barrels and 15 to 15½ in cases. No. 3 ranges from 11¼ to 12 cents for barrels and 12 to 12¼ cents for cases.

CACAO BUTTER.—Shows an increasing firmness and available supplies are light. Bulk foreign is quoted at 32½ to 34 cents, and domestic at 35 to 40 cents in 12-pound boxes.

COD LIVER OIL.—Is in fair demand by consumers, and prices for prime Nor-

wegian range from \$19.50 to \$25, according to brand.

GLYCERINE.—Is quiet and prices are unchanged. Prime quality is quoted at 12½ to 13 cents in drums and barrels and 50-pound cans at 12½ to 15 cents.

SESAME OIL.—Is experiencing a slight advance owing to smallness of stocks. Prices range from 65 to 68 cents in barrels.

QUICKSILVER.—In only moderate demand and 45 to 46 cents is asked, according to quality.

NAPHTHALINE.—Has declined to 4 cents for balls, and 3 and 3½ cents for flake.

BLUE VITRIOL.—Demand is limited to small jobbing quantities, and ranges in price from 3½ to 3¾ cents, according to quality and quantity.

VANILLA BEANS.—Increased demand from consumers and limited supplies are creating a decidedly upward tendency of the market. Mexican beans are ranging from \$6.50 to \$13 as to quality, and Bourbons are also displaying considerable firmness owing to reported advances abroad. Cut vanillas are also in active demand at prices ranging from \$5 to \$6.50.

TONKA BEANS.—Holders are looking for a firm market and are stiffening prices. Angostura are quoted at \$1.85 to \$2 and Para at 35 to 45 cents.

SUGAR OF MILK.—Competition and accumulating stocks have tended to lower prices somewhat. Powdered is now quoted at 11 to 14 cents and double-refined American at 15 cents.

SARSAPARILLA, MEXICAN.—Is easy, though stocks are fast becoming depleted. Jobbing prices are quoted at 2½ to 10 cents.

CANARY SEED.—Is firmer owing to fair demand, limited supplies and the report that the Smyrna market shows an upward tendency. Prices range from 2½ to 3 cents.

MUSTARD SEED.—Is quiet, the California market showing signs of dullness.

RAPE SEED.—Is active and firm and supplies are limited with prospect of advance in the near future.

CELERY SEED.—Is weak and unsettled, but previously reported prices are still maintained for prime goods.

CARBOLIC ACID.—Is reported higher abroad with the result that prices here are becoming firmer.

NITRATE OF SILVER.—Shows a slight decline in sympathy with the low price of the metal.

SPIRITS TURPENTINE.—Has advanced 1 cent per gallon and the market is firm.

JUNIPER BERRIES.—Unfavorable reports from abroad have advanced prices slightly.

The recent advance in spirits turpentine and naval stores is attributed to the manipulations of the Antwerp Naval Stores Company, which seems to have gotten a corner upon the market. The matter is thus referred to by the Savannah News:

"The Antwerp Company came to Savannah last summer, and brought with it large quantities of European money, which is controlled, and with which it has been able to acquire a heavy stock of spirits, as well as of rosins. The company did a great deal for this section in bringing European money at a time when other dealers could not obtain it, and has also played in immense luck, having now

on hand about 80 per cent of all the spirits of turpentine in the market. Of the Savannah stock, which is in the neighborhood of 10,000 barrels, it has about 8,000, besides a large stock across the waters.

The consequence is, the Antwerp company has practical control of the market. The daily receipts of spirits are now rather small, and the price has advanced to 31 cents—higher than it has been at any other time during the present naval stores season. There is a bright prospect for a continued advance in price, and some of the dealers say spirits may go as high as 35 cents. The Antwerp company bought most of this spirits when it was 25 and 26 cents, and it is now in a position to realize quite handsome profits. The factors are rejoicing that the market has been forced up to that figure, while some of the buyers, who are not quite so fortunate as to have a stock on hand, are complaining of the bull."

W. H. Bowdler & Co., Boston, crude crude beeswax at 28 to 30 cents. W. H. B., refined, 30 cents; white, 40 cents; Carnauba wax, 18 to 22.1-2 cents; Ozokerite, 6 to 10 cents.

PATENTS,

TRADE-MARKS AND DESIGNS.

From U. S. Patent Office Gazette.

PATENTS.

- 513,640—Bottle-Washer.—Conrad Huether and Joseph E. Gross, South Bethlehem, Pa.
- 513,760—Paper Box.—Dwight S. Clark, Rochester, N. Y., assignor to the Stecher Lithographic Company, same place.
- 513,804—Apparatus for Inhaling Vapors.—Edward Madden, Amsterdam, N. Y.
- 513,825—Process of and Apparatus for Making Ozone.—Christen R. Poulsen, Horsens, Denmark.
- 513,899—Apparatus for Sterilizing or Cooking.—Louis Edelman, Detroit, Mich.
- 513,971—Process of Making Aluminum Fluorid.—Wilhelm Ackermann, Giebichenstein, Halle-on-the-Saale, assignor to the Grabau's Aluminium-Werke, Trotha, near Halle-on-the-Saale, Germany.
- 514,003—Process of Purifying Aluminous Minerals.—Heinrich F. D. Schwahn, Kansas City, Mo.
- 514,040—Process of Purifying Native Sulfate of Barium.—Heinrich F. D. Schwahn, Kansas City, Mo.
- 514,041—Method of Separating and Recovering the Constituents of Ores, Earths, Clays, Etc.—Heinrich F. D. Schwahn, Kansas City, Mo.
- 514,124—Process of Making Nitric Acid and Caustic Alkali.—George Lunge, Zurich, Switzerland, and Farnham M. Lyte, London, England.
- 514,125—Process of Making Caustic Alkali and Lead Chlorid.—Farnham M. Lyte, London, England, and George Lunge, Zurich, Switzerland.
- 514,318—Electrode for Use in the Manufacture of Chlorin and Caustic Soda.—James Greenwood, London, England, assignor to the Caustic Soda and Chlorine Syndicate, Limited, same place.
- 514,575—Nursing Bottle.—Edward H. Turner, Minneapolis, Minn.
- 514,590—Air Pump.—John Dickens, New Brunswick, N. J., assignor to the Dickens Manufacturing Co., same place.
- 514,632—Dimethylpiperazin.—Carl Stoehr, Kiel, assignor to the Farbenfabriken,

vormals Fr. Bayer & Co., Elberfeld, Germany.

- 514,683—Paper Box.—Sheldon E. Patrick, Rockland, Mass., assignor to the New England Folding Box Company, of Massachusetts.
- 514,838—Nitro Compound and Process of Making Same.—Robert C. Schupphaus, Brooklyn, N. Y.
- 514,812—Capsule Closer.—Karl Morstadt, Prague, Austria-Hungary, assignor to J. M. Grosvenor & Co., Boston, Mass. Reissues.
- 7,485—Processes and Apparatus for Evaporating and Calcining Alkaline Solutions.—M. L. Keen, Stroudsburg, and Hugh Burgess, Royer's Ford, Pa., assignors to American Wood Paper Company.

Patents expired during January, 1894.

- 155,825—Methods and Apparatus for Cooling and Spreading Glue.—Chas. O. Garrison, New York, N. Y.
- 155,852—Combined Siphon Tap and Stopper for Aerated Liquor Bottles.—H. J. Cole, Wandsworth Road, England.
- 155,853—Siphon Tap and Stopper for Aerated Liquor Bottles.—Henry J. Cole, Wandsworth Road, England.
- 155,964—Apparatus for Manufacturing Sulphurous Acid.—Alvaro F. C. Reynoso, Paris, France.
- 156,485—Preparing Aniline Dyes.—L. Leigh, Pittsfield, Mass.
- 156,743—Soda-Carbonating Apparatus.—J. McCloskey, East Cambridge, Mass. Expired February 6, 1894.
- 157,031—Hypodermic Syringes.—J. McMorries, Newberry, S. C.
- 156,951—Processes for Refining Crude Ozokerit.—C. M. Pielsticker, London, England.

Expired February 13, 1894.

- 157,250—Manufacture of Malt Sirups or Extracts.—O. F. Boomer and H. R. Randall, Brooklyn, N. Y.
- 157,357—Apparatus for the Manufacture of Mineral Water.—E. Cornelis, New York, assignor to himself and J. M. Elliott, same place.
- 157,413—Processes of Producing Artificial Cold by means of Anhydrous Sulphurous Oxide.—R. B. Pictet, Geneva, Switzerland.
- 157,446—Soda Water Apparatus.—O. Zwietusch, Milwaukee, Wis.

TRADE MARKS.

- 24,096—Tonic Medicine.—John N. Barker, Willard, Utah Territory. The initials "J. N. B."
- 24,097—Certain Named Remedies.—The Dysmenotone Co., Camden, N. J. The word "Dysmenotone."
- 24,098—Tonics for the Hair.—Netta Anna Catherina Folke, New York, N. Y. The word "Nadoline."
- 24,099—Hair Wash.—Seraphin Lachance, Montreal, Canada. The representation of an ornamental medallion provided with an outward ornamental circular frame, an inner belt provided with a buckle and bearing the words "Nil Sine Labore," with the word "Capilline."
- 24,134—Artificial Mineral Water.—White Rock Mineral Spring Company, Waukesha, Wis. The word "Ozonate."
- 24,140—Remedy for Neutralizing the Effects of Intoxicants.—George H. Bonte, Cincinnati, Ohio. The word "Presto-Bracene."
- 24,142—Antiseptic Chewing Candies and Gum.—The Antiseptic Company, Owensborough, Ky. The word "Antiseptic."

- 24,143—Remedy for the Diseases of the Respiratory Organs.—Angus MacKinnon, Alvinston, Canada. The word "Pine-Malt."
- 24,144—Remedy for Certain Affections of the Skin.—Daggett & Ramsdell, New York, N. Y. The word "Lettuce-Cream" printed horizontally across the representation of a head of lettuce.
- 24,145—Medicine to Purify the Blood.—Walter A. Lovering, Nashua, N. H. The word "Lovering" and the representation of three stalks of red clover with three blossoms and seven leaves attached, one of which represents a four-leaved clover with blossom attached.
- 24,146—Internal Remedy for Certain Named Diseases.—The Germozene Company, Austin, Tex. The word "Germozene."
- 24,147—Salve.—Rita E. Maunel, St. Louis, Mo. The word "Favorita."
- 24,148—Medicinal Plasters.—William H. Gannett, Augusta, Me. The word "Oxien."
- 24,149—Tooth Paste or Dentifrice.—William J. Hurd, St. Paul, Minn. The words "King Bee" and the representation of a bee's body with a portrait of the registrant for a head to the same.
- 24,174—Fountain Sirups, Flavoring Extracts and Phosphates.—J. Hungerford Smith Company, Rochester, N. Y. A disk-shaped figure bearing the words "True Fruit."
- 24,183—Family Dyes.—Heitmann Bros., Cologne, Germany. The representation of a fox's head inclosed by a circle from which radiating lines or spear points extend.
- 24,185—Toilet Lotions.—Seraphin Lachance, Montreal, Canada. The portrait of Madame Teresa Careno, a famous pianist.
- 24,186—Cosmetic Lotion, Cream Jelly, and Soap for the Toilet.—Sylvan Toilet Company, Detroit, Mich. The words "Satin Skin."
- 24,188—Antiseptics.—Chemische Fabrik auf Actien, vormals E. Schering, Berlin, Germany. The word "Trikesol."
- 24,189—Disinfecting Product.—Lebon & Salomon, Paris, France. The words "Chlorol Marve."
- 24,190—Pills.—Adolph Schmidt, New York, N. Y. The representation of two female figures, one standing and carrying a basket and holding a bunch of herbs, and the other sitting with the right arm resting on a basket of flowers.
- 24,191—Pharmaceutical Preparation for the Skin.—Henry Finkelpearl, Pittsburg, Pa. The words "Angel Balm."
- 24,192—Topical Remedy for Toothache, Neuralgia, Burns and Wounds.—Emilio Dahlhaus, Mexico, Mexico. The words "La Maravilla."
- 24,193—Proprietary Medicine Used as an Injection.—Henry F. Bader, New Albany, Ind. The word "Night" and the letter "O" inclosing the representation of an owl and the letters "W. L."
- 24,194—Certain Named Medicine.—E. M. Johnson & Co., New York, N. Y. The word "Arsenauro."
- 24,195—Certain Named Medicine.—E. M. Johnson & Co., New York, N. Y. The word "Manganauro."
- 24,197—Certain Named Medicine.—E. M. Johnson & Co., New York, N. Y. The word "Mercauro."
- 24,198—Remedy for Diseases of Women.—German American Drug Company, Ohio City, Ohio. The word "Uterina" in

BOOK REVIEWS.

- block capital letters arranged in an oblique line across a label.
- 21,199.—Medicine for Cholerine or Diarrhoea. Jason W. Carson, Indiana, Pa. The representation of a capsule bearing the letters and word "C" or "DC."
- 21,200.—Veterinary Remedies.—James F. Smith, Texarkana, Ark. The word "Horsaparilla."
- 24,201.—Hoof Oil and Ointments.—Charles F. Kissel, Indianapolis, Ind. The word "Globe."
- 24,225.—Perfumery.—The C. L. Cotton Perfumery and Extract Company, Earlville, N. Y. The word "Chrysanthemum."
- 24,227.—Balsam.—Ferdinand Mayerhofer, Brooklyn, N. Y. The representation of an angelic figure above an ellipse bearing a pair of scale balances and an anchor having the letters "F. M." on either side thereof.
- 24,228.—Iron Derivatives of Albumen.—C. F. Boehringer & Soehne, Waldhof, near Mannheim, Germany. The word "Ferratin."
- 24,229.—Diuretics.—Gaetan Fournier, Paris, France. The word "Kava."
- 24,230.—Remedies for Catarrh.—Abjahn R. Pratt, Hastings, Mich. The letters "A. R. P."
- 24,231.—Remedy for Chills and Fever.—William F. Morrow, Cincinnati, Ohio. The word "Chill-a-cura."
- 24,232.—Medicine for Certain Named Diseases.—Anthony A. Rhuland, Stoneham, Mass. The words "Traveller's Joy."
- 24,233.—Certain Named Remedies.—James O. Ducker, William T. Findly and George Harvey, Louisiana, Mo. The word "Pan-a-kas."
- 24,234.—Liquid Medicinal Compound for External and Internal Use.—Gardner S. Cheney, Boston, Mass. The letters "NPPDD" arranged in the form of a cross with the letter "P" in the center, "N" at the left, "D" at the right, "N" above and "D" below.
- 24,235.—Medicine for the Cure of Eczema.—George W. Rankin, Pekin, Ill. The words "Anti Eczema" and a monogram of the letters "G. W. R."

SHOPPELL'S MODERN HOUSES. No. 41, contains 50 colonial designs and 26 designs of other styles of houses ranging in price from \$1,200 to \$5,000. It also contains several designs for stables, store fronts, staircases, an article on picture hanging and much other matter pertaining to building. It is published by the Co-operative Building Plan Association at 63 Broadway, New York. Price 50 cents.

It is said that there are eighteen quinoline factories in the world, located as follows: one in Holland, two in England, two in Italy, three in France, four in the United States, and six in Germany.

The Faultless Chemical Co., 304 Sharp street, Baltimore, has been organized to manufacture extracts, chemicals, chewing gums, etc. Capital stock, \$10,000.

W. H. Simmons, 53 Pocommet street, Fall River, Mass., is offering to the trade a line of medicated cottons and bandages.

The Diamond Medicine Co., of Pemaquid, Me., has been organized to manufacture and sell a line of proprietary medicines.

"THE POLITICAL ECONOMY OF NATURAL LAW." The purpose of this work is to outline a political economy which is practical and natural rather than the theoretical or artificial and to present such views in a manner admitting of easy comprehension. The author finds little sympathy with the chimerical plans of professional labor reformers, sentimental philosophers, etc., and apparently regards the present general condition of society as one which has come through immutable natural laws. The faults of the present "social system" are ascribed to moral delinquencies in personal character, which is really all the obstacle there is in the pathway of the most radical reformer and his plans. However all criticism is disarmed by the statement, "In whatever way superficial critics may construe detached statements of this book, the fact will remain that its deepest intent and animus is the true welfare of the workman." As the subject of political economy has probably never occupied so much attention in the popular mind as at present, this work may be considered a valuable addition to the literature of a subject which presents many phases, and of which many men have many minds.

"THE PHYSICIAN'S WIFE.—The authors was not pleased when she learned how little record appears in history and literature of the doctor's wife and she decided to correct this deficiency so far as she might. She has done extremely well. Her homely, simple recital of the trials, cares, sorrows and joys of the wife of the country practitioner appeals strangely to the sensibilities, the frequent bits of pathos and humor rendering each page fascinating and holding the reader's attention to the end. She shows the physician's wife in her true position, sharing his burdens, cheering him when he is oppressed with responsibility, contributing to his professional prosperity, a true helpmate in all that goes to constitute his best and truest success. Doctors all, and their wives too, should read this little work.

"SYSTEM OF INSTRUCTION IN QUALITATIVE CHEMICAL ANALYSIS.—In January, 1893, we carefully reviewed this work, then in its first edition. This early appearance of a second edition is proof of the correctness of our prediction that it would win considerable acceptance as a text book in class room and laboratory. This has been its reception, and it is not necessary to repeat or add to the description and commendation of our former notice. The book speaks for itself and speaks well.

"The Political Economy of Natural Law.—By Henry Wood. Cloth, 305 pages. Price, \$1 25. Boston, Lee & Shepard.

"The Physician's Wife: and the Things that Pertain to Her Life. By Ellen M. Firebaugh. With portrait of author and 44 photo-engravings. 20 pages. Extra cloth, \$1 25 net. Special limited edition, first 500 copies, Half-leather and Vellum cloth, \$3 net. Philadelphia: The F. A. Davis Co.

"A System of Instruction in Qualitative Chemical Analysis. By Arthur H. Elliott, Ph. D., Professor of Chemistry and Physics, and Director of the Chemical Laboratory in the College of Pharmacy of the City of New York. Second edition, cloth, 129 pages, \$2, published by the author, College of Pharmacy, City of New York, 1892.

PEORIA, ILL.

Samuel Cottonberry is the possessor of a camera. It will be put into good use at the I. P. A. meeting.

Henry Woodward, senior member of the Allnair & Woodward firm, died February 11 of Bright's disease.

Julius Ulrich has finished his junior course at the Northwestern University, department of pharmacy.

T. N. Jamieson, of Chicago, attended the Republican Editors' Association meeting held here during the first week in February.

Charles Zimmerman and family intend to start May 1 on a trip to Germany. Mr. Zimmerman was to have been our local secretary of the Illinois Pharmaceutical Association, but on account of his trip he transferred his office to Charles A. Strathman.

Among the printed matter sent out by the secretary of the Illinois Pharmaceutical Association we find a notice: "I. P. A.—The next meeting of the Illinois Pharmaceutical Association will be held in Peoria August 14, 15, 16, 1894. Peoria is noted for the splendid manner in which they entertained those in attendance years ago, and I am assured by its local secretary, Charles A. Strathman, that Peoria will do her level best to entertain all who come in a manner that they will be right glad they came."

Now, that is perfectly correct. We have an elegant city here, can show visitors beautiful scenery and town lots, cheap; all the facilities for a good and profitable time. Manufacturing drug houses will be pleased to show them through their establishments. The distilleries are at their disposal, where they can see the manufacture of alcohol, also the glucose works, charcoal works, etc. At present there seems to be a slight misunderstanding among the members where they should hold their meeting. Some want the Women's Club hall, others want the Turner Hall. The proper place to hold the meeting is in the auditorium of the Y. M. C. A. building, which faces the court house square, one-half a block from the two principal hotels in the city, and which has the best, all around hall for seating capacity and acoustics. It certainly would not look very well to have the association meet in our city in an out-of-the-way place, so that the citizens of Peoria would not know anything about it.

As was predicted, the Takamine process which is being tested on a large scale in one of the distilleries, finds its star gradually setting lower and lower. The Takamine process uses corn and small grain instead of rice. It dispenses with malt. In the malt process the yield averages about 5.40 gallons to the bushel. So far as can be learned, the highest yield by the Takamine process is 5.35. There is a vast difference between yeast and koji, for where the former is made it can be readily told how much it will yield; but with the koji it is uncertain. At first it was said that the koji process would revolutionize the distilling industry, but at present the claim is that they cannot make more from the same grain, but can make it cheaper.

The Lettuce Cream Co., 114 Fifth avenue, New York City, has been organized to manufacture a line of toilet preparations.

SAMUEL P. SADTLER.

THE subject of this sketch has just about reached middle life, having been born July 18th, 1847, at Pinegrove, Schuylkill Co., Pennsylvania, where his father, a Lutheran clergyman, was at that time residing. His preparation for college was acquired in the public schools at Easton, Pa., and he was graduated from Pennsylvania College at Gettysburg in that state at the age of 20. Having acquired a fondness for scientific studies during his college course, he determined to choose teaching as a profession. After a year spent at Lehigh University, which had been recently founded at Bethlehem, Pa., he went to Harvard University and entered the Lawrence Scientific School, then regarded as the foremost chemical school in the country. He remained here, working under Dr. Wolcott Gibbs and Professor Josiah P. Cooke, until January, 1870, when, having received the degree of S. B., he went to Germany to finish his education and entered the laboratory of Prof. Woehler at the University of Goettingen. He was one of the last, if not the last, student admitted to the privilege of working directly under the venerable Woehler, who had himself been a student of Berzelius, so that the great Swedish pioneer of modern chemistry did not seem to him quite the historical myth that he appears to the present student of chemistry.

Having received the degree of Doctor of Philosophy in the spring of 1871, he returned to America, and in September began his teaching career as professor of chemistry and physics in the Pennsylvania College, at Gettysburg, from which he had been graduated four years previous. In 1874 he accepted the position of professor of general and organic chemistry in the University of Pennsylvania and removed to Philadelphia, where he has since resided.

In 1878 the pressure of advancing years and bodily infirmities made it necessary for Dr. Robert Bridges, for many years the professor of chemistry in the Philadelphia College of Pharmacy, to seek help in his work, and Dr. Sadtler was called upon to assist him by taking up the junior lectures for the winter of 1878-79. In the spring following Dr. Bridges was made emeritus professor and Dr. Sadtler was elected his successor. Thus was begun his connection with pharmacy, which has become closer with successive years of teaching and association in the oldest of our colleges of pharmacy. His connection with the University of Pennsylvania, on the other hand, was severed in 1891, after seventeen years of service, in order to find time for his practice as consulting chemist and expert in chemical patent cases, which had begun to make demands upon him.

His literary activity began in 1870 with the publication of his Cambridge thesis work in Silliman's American Journal of Science, and has continued steadily to the present. Besides a score or more of published scientific papers and lectures, he published in 1877 a "Handbook of Chemical Experimentation" for the use of teachers and lecturers, and in 1891 a "Handbook of Industrial Organic Chemistry," which latter work has had an extended sale both in this country and in England. A companion volume on "Industrial Inorganic Chemistry" is in course of preparation. Since 1880 he has been chemical editor of the United States Dispensatory, and with Professors Wood and Remington has seen through the press the fifteenth, sixteenth and seventeenth editions of this great work. A text book of chemistry for the use of pharmaceutical students, which he has written jointly with his colleague, Prof. Henry Trimble, will appear in the fall. He has been a fellow of the Chemical Societies of London and Berlin and of the American Chemical Society for a number of years, but made his first appearance as a member of the American Pharmaceutical Association at its recent meeting at Chicago, although as a delegate to the Pharmacopoeia Revision Convention of 1890 at Washington, he had become acquainted with many of the most active workers in pharmacy.

ENTERED AT THE DETROIT O. A SECOND-CLASS MATTER

ESTABLISHED 1887

THE PHARMACEUTICAL ERA.

SEMI-MONTHLY.

Issued on the 1st and 15th of Each Month.

D. O. HAYNES & Co., Publishers,
DETROIT, MICH.For subscription and Advertising Rates see
advertising page 30.

REMOVAL NOTICE.

After May 1st, 1894, the publication office of
THE PHARMACEUTICAL ERA will be at

100 Fulton Street, New York City.

With increased facilities and the additional
advantage of being in close touch
with the leading drug markets, we expect
to introduce many new and valuable fea-
tures in the Journal, which will be to the
advantage of our subscribers and adver-
tisers.

D. O. HAYNES & CO.,
Publishers.

EDITORIAL.

ILLINOIS PHARMACY LAW.

In our last issue were a few comments
upon the Board of Pharmacy's interpre-
tation of the Illinois pharmacy law, and
attention was called to a probable error
in the board's circular. The secretary re-
plies that some of the circulars sent out
did contain the error mentioned, but it
was quickly discovered and corrected.
The sentence should read: "The sale of
patent medicines is not prohibited by the
pharmacy law," thus confirming our un-
derstanding of the act.

THE DEANS' CONTROVERSY.

Space is given in this issue to a reply
from the dean of the Illinois College of
Pharmacy to the dean of the Chicago Col-
lege of Pharmacy. Mr. Martin, when he
commented upon American pharmacy,
probably had little thought of reviving
the Chicago quarrel, but some of his re-
marks seem to have had that effect. We
have now given the two factions equal
opportunity for attack and rejoinder, and
will let it go at that. No good can come
from acrimonious strife, but it must be
confessed some of the statements and ad-
missions made by the rival deans afford
confirmative support to certain remarks
of Mr. Martin.

HOBBIES FOR THE DRUGGIST.

One of our contributors has given us for
this issue a scheme for the analysis of
cryptograms. This paper will, no doubt,
attract interest from readers with aspira-
tions in botanical directions, and to others
it will suggest subjects for study in leis-
ure moments and lines of investigation
which may be made not only of interest
but of considerable profit to the pharma-
cist. It is a good thing to have a hobby,
whether it be cryptograms, perpetual mo-
tion or flying machines, though, of the
three named, the first is most promising.
In the study of such a subject comes into
play the training acquired in the several
branches of one's pharmaceutical educa-
tion, a knowledge of botany and practical
microscopy being specially necessary.
The study of unusual or generally unob-
served parts of creation, if undertaken in
a systematic manner and prosecuted vigor-
ously, is of intense interest and in-
struction. We are not cryptogramical ex-
perts, but can easily realize the true satis-

faction Mr. Sollman receives in this study,
and the suggestion is offered by him and
by us to other druggists that if profitable
reaction be desired, here is presented a
pleasing field. The man with a hobby is
the one who is truly happy and generally
the most useful.

A NEW PLAN.

Pharmaceutical journals generally and
many writers upon pharmaceutical topics,
in discussing the causes of the present
demoralized condition of the drug trade
regards the traffic in patent medicines,
have advanced as the true practical and
ethical solution of the problem that druggists
make their own preparations, and
build up a trade strictly legitimate and
within their province as pharmacists, and
urged that the true way of overcoming
the patent medicine evil was to leave this
class of goods alone and devote all en-
ergies to the fostering and advancement
of the true professional pharmaceutical
spirit. Many have been the papers and
editorial utterances under the caption of
"Make Your Own Pharmaceuticals," but
elsewhere in this issue, says that the prac-
tice of making one's own pharmaceutical
preparations is the cause of and not the
remedy for the cut rate abuse. We con-
fess that the matter has never before ap-
peared to us in this light, and it will take
considerable convincing before we are
willing to advocate that the druggist dis-
continue the manufacture of his own
pharmaceuticals and confine himself to
the sale of patent medicines. We print
the letter in question, for the reason that
we like to be fair and give every man a
chance to discuss questions of concern to
pharmacists.

"BLIND" PRESCRIBING.

We are asked if the physician is under
obligation, morally, professionally, or le-
gally, to write his prescriptions in a way
decipherable by pharmacists in general, or
may he, if he choose, employ "blind" pre-
scriptions, understood only by a certain
dispenser. Morally and professionally he
is under such obligation, but legally he is
not. Our correspondent supplies us with
samples of a certain physician's prescrip-
tions that can be understood only by
initiated pharmacists, and this correspond-
ent complains that he has frequently been
obliged to tell his customers that he could
not put up these prescriptions, not know-
ing what they called for. Naturally, he
sees injury to his business in the turning
away of customers who are told of this
inability. The physician who wrote these
particular prescriptions may have be-
lieved that he had good and sufficient rea-
sons for not trusting them to any save
the one pharmacist to whose store they
must go for filling, but a less flattering
supposition is that he had financial rea-
sons, for the druggist who can translate
the prescriptions is the physician's own
brother. A physician who will enter into
financial arrangement with any druggist
is certainly to be considered unprofes-
sional, unethical. Though the majority of
physicians and pharmacists are in their
professions for the sake of a livelihood
and what they can make out of them,
still there are higher considerations than
mere financial gain. The health and safety
of the public must not be trifled with, and
endangered by blind prescribing, prescrip-
tion percentage, and other unprofessional
conduct.

WHO IS RESPONSIBLE.

In Montreal early in February occurred
a more than usually distressing instance
of an error in the dispensing of drugs.
A physician, wishing to administer to his
wife a dose of sublimate of bismuth,
telephoned to a drug house for a supply.
This drug house, being out of the article,
sent the order to a second wholesale
house, and the latter supplied a two-pound
package labeled bismuth. The first druggist
then sent the required amount to the
physician. Upon administration to the
patient, however, alarming symptoms
quickly arose and, despite utmost exertions,
her life was sacrificed. Examination
of the contents of the package
showed it to be tartar emetic. All the
evidence goes to show that the error in
labeling occurred at the second drug
house, upon which, of course, the respon-
sibility primarily must rest. But the
question arises, is the druggist who im-
mediately supplied the physician culp-
able? In opening the larger package to
withdraw the smaller amount needed,
should he have detected the error in the
contents? Upon presenting the case to
druggists for comment, some say the
mistake should have at once been ob-
served, while others say the dissimilarity
in appearance between bismuth sub-
nitrate and tartar emetic is not sufficient
to allow of distinction between the two
save by regularly applied tests. It is
not sufficient to say that this is but an-
other instance of an unavoidable accident.
The responsibility cannot be shifted from
the house whose business methods are
such that a single infraction or negligence
in the method of wrapping and packing
goods admits of such serious results.

TEACHING METHODS IN SCHOOLS OF PHARMACY.

The past few years have seen great al-
terations in the methods of teaching stu-
dents of pharmacy, and there has been
rapid change from didactic systems to the
more modern forms of manual or practical
training. Now every college of pharma-
cy has its chemical laboratory, some
of them teaching chemical analysis to a
very satisfactory extent. Nearly all have
pharmaceutical laboratories where the
student may acquire manual dexterity and
practical experience in compounding phar-
maceutical preparations and remedies.
Farther than this some have not yet
progressed, but there are others, and
not a few, which have attained to the
dignity of microscopical and toxicological
laboratories and the practical manual
teaching of botany, pharmacognosy, etc.
In this issue is given the first instalment
of a valuable article upon the teaching of
pharmacognosy, a subject and branch of
pharmaceutical education which is now
receiving from progressive teachers and
the progressive element of the profession
that recognition to which it is so justly
entitled. The writer presents his points
plainly and forcibly, and instructors in
other institutions may be able to glean
from the paper much of moment and
value to them in the way of suggestion
and for the improvement of teaching
methods. Subsequent portions of the paper
will be devoted to detailed, practical
descriptions, and consistently illustrated.
The student of pharmacy will profit, too,
with the teacher in having placed before
him the importance of this branch of

pharmaceutical training, and the way so plainly marked out for him for the study of this essential.

LIQUOR SELLING BY CHICAGO DRUGGISTS.

The editorial remarks in our last issue upon this topic have called forth a protest from Mr. Hogan, printed on another page. He feels aggrieved, and naturally says so, by the implied accusation that he is a law-breaker. In our remarks we had no intention other than to discuss generally the question of illegal liquor sales by druggists, using the recent prosecutions in Chicago as example or text. We are sorry that we should have offended Mr. Hogan and are quick to offer him opportunity for rejoinder and defense. The published accounts and information coming to us from other sources may have been incorrect, and we are glad to believe Mr. Hogan guiltless of infraction of the liquor law, but in general we see no reason as yet to modify our remarks as published. Where there is so much smoke, there must be some fire, and we believe it is true that some of the druggists arrested pleaded guilty of the offense and paid their fines without protest. We have no sympathy with those who would agitate this question solely from motives of a political character, but it cannot be denied, nor do we think Mr. Hogan would attempt to deny, that there are druggists in Chicago who violate the liquor law and that some or many of these were included among those arrested. We would repeat our belief, expressed on many previous occasions, that the liquor laws under which druggists are constrained to carry on the business are very carelessly observed. We are glad that Mr. Hogan is among those who are strict in their observance of the regulations, and believe he will be with us in denouncing the careless and wilful law-breaker.

EASTER.

Of all the holidays, legal or otherwise, there are none in which the druggist is not interested or more or less conspicuous. His place of business takes on a decidedly lively aspect during the season of the midwinter holidays, when the influence of St. Nicholas and the desire to turn over a new leaf pervade the land. On Thanksgiving day he makes no demonstration, except that he quietly remembers his mercies and is thankful that matters are not worse than they are. On the nation's birthday, in the smaller towns, he joins with the rest of his mercantile brethren in dealing in firecrackers and other lurid material, and on Decoration Day he is not guilty of causing a break in the universal display of his country's colors. During the season of St. Valentine he furnishes much of the pictorial material with which one-half the world either maddens or gladdens the other half. As for the celebration of the occasions which mark the birth of the truthful father of our country and that of the labor movement, the druggist observes the spirit of these all the year round.

In view of his attitude towards holidays in general, it is therefore to be expected that the approaching event of Easter will be one upon which he will bestow considerable attention. While the innocent rabbit is compelled to pose before the younger generation as the producer of colored eggs, the druggist is busily en-

gaged in selling to the elders some of the material which aids in the deception.

When the deep significance of this coming holiday is considered, it is hoped that its material aspect will be as bright as it is religious. The country needs a resurrection, and an awakening into a new life. There is a spirit of optimism already abroad, and people are everywhere saying that improvement in business affairs must and will come soon. Let us date the beginning of this revival on March 25, 1894.

DOCTORS ARE NOT PHARMACISTS IN KENTUCKY.

There are some people who cannot be convinced that the physician's training is not of quite the right kind to qualify him for the practice of pharmacy, and the legislatures of the different states are frequently called upon to pass bills allowing the physician the right to open a drug store and compound medicines merely upon showing his diploma from a college of medicine. On January 19 a bill was introduced into the House in Kentucky, the purpose of which was to make medical schools and colleges equal and co-ordinate with pharmaceutical schools and colleges in their powers and authority to issue and grant certificates, licenses and diplomas to graduates to compound medicines to sell drugs and act as pharmacists in the State of Kentucky. This bill was passed by the House before the pharmacists of the state had been awakened to the danger. As soon as the news of its passage was spread abroad, the druggists and many of the medical fraternity went vigorously to work to prevent its passage in the Senate, and this, we are happy to state, they accomplished. The bill did not emanate from any of the colleges of medicine, for to the credit of these institutions, it may be said they are utterly opposed to such an unjust act and the faculties of the colleges in Louisville express themselves very decidedly to that effect, saying that the curriculum of the college of medicine embraces no adequate provision for pharmaceutical education, and a regular medical education does not qualify a medical graduate for the practice of pharmacy. Medical colleges in Kentucky annually graduate several hundred young men, who, if this act had become a law, would have received the privilege of opening drug stores in competition with the regular pharmacists, whose ranks are recruited from the college of pharmacy to the number of only a score or so annually. No one in either profession with any true knowledge of the character and responsibilities of his calling, would be willing to father such a proposition as the one which failed of approval in the Senate of Kentucky.

DO NOT INCREASE THE ALCOHOL TAX.

The Wilson tariff bill, as amended in the Senate finance committee, is now the topic of discussion in the Senate, but no one can yet predict with any measure of certainty what way the critter will jump. Some features of the bill, as it now stands, are of greatest importance to the drug trade, and it is not yet too late to work for modification of the obnoxious propositions it may embrace. Of special significance are the internal revenue and customs features. The sections covering the tax on spirits are new throughout and are a substitute for the house sections struck out. The main section of the sen-

ate bill is as follows: "That on and after the first day of the second calendar month after the passage of this act there shall be levied and collected on all distilled spirits in bond at that time or that have been, or that may be then or thereafter produced in the United States on which the tax is not paid before that day a tax of \$1.10 on each proof gallon, or wine gallon when below proof, and a proportionate tax at a like rate on all fractional parts of such proof or wine gallon: Provided, that in computing the tax on any package of spirits all fractional parts of gallon, less than one-tenth shall be excluded."

The changes made in the tariff on imported wines are not many. On all spirits and cordials additional provisos are ordered declaring in effect that when imported in bottles and jugs no additional duty shall be assessed on the bottles and jugs. The following language in the Wilson bill is stricken out:

"All compounds or preparations, of which distilled spirits are a component part of chief value, not specially provided for in this act, there shall be levied a duty not less than that imposed upon distilled spirits."

In place of this the following is inserted: "Upon all compounds or preparations containing alcohol there shall be levied a duty at the rate of \$1.80 per proof gallon upon the distilled spirits contained therein, in addition to the duty provided by law upon the other ingredients contained in such compounds or preparations."

The drug trade is protesting vigorously against an increase in the tax on alcohol, and some associations, the Iowa Pharmaceutical Association is one, are urging that druggists write to their United States Senators and impress upon them the grievousness of the burden it is sought to impose. The tax on alcohol already amounts to five times the cost, and there is no reason why a necessary article should be so overburdened with taxation.

Alcohol is a necessity, for it enters into the composition, or is used in the manufacture, of almost every medicine sold or dispensed. The bill now pending proposes a tax equivalent to \$100 on every druggist in the country, on some a much greater sum, and must come wholly from their profits, which cannot be proportionately increased. If druggists are prompt in writing to their Senators, our Iowa brethren believe this section of the bill will be defeated, and we join with them in strongly urging that immediate action be taken. A day may mean success or failure.

THE IMPORTANCE AND VALUE OF ORGANIZATION.

The retail drug trade has, for some months past, given evidence of very unusual interest and concern, the result being the formation of many local associations and the stirring up of state organizations to the end that the financial and commercial interests of the pharmacist may be better conserved and forwarded. The trade of the entire country has long suffered from the defection of a large proportion of the sale of patent medicines into other channels, and, as this branch constitutes a very important portion of the druggist's business, he has contemplated with fear and trembling the immediate as well as prospective results of this diversion. The trade is passing through a critical period in its his-

tory, and that this is realized is evidenced by the interest manifested in any plan, any movement, for the correction of existing abuses. The patent medicine has been discussed in all its phases, and the issue brought fairly before the trade is, whether the business in proprietary articles shall be restricted to druggists and prices maintained at certain fixed figures, or shall this traffic be thrown open to general competition by all branches and varieties of merchants. Druggists want to keep this trade and propose to do so, if possible, but just what is the proper way to keep it is the question. All are united, however, in saying that if there is to be salvation, it must come through thorough organization of the retail trade for the purpose of concerted, harmonious and strong action. Acting upon this principle, druggists in towns and cities throughout the country are combining into local organizations. We present on another page the report of the first annual meeting of one of these organizations in Rhode Island, which shows what may be done through the earnest effort of even a handful of persistent workers. Nearly every town of any size in the New England states has its local association of druggists, and similar bodies are to be found in every other state of the union, though, as yet, not in every town. Within the past twelve months, however, a highly gratifying number of these local bodies have been formed, mainly for the purpose of giving support to the Inter-State Retail Druggists' League's efforts for the protection of the trade against the cutting of prices on patent medicines. Whatever may be the criticisms upon the Detroit plan, the fact remains that it can be made a success if there be sufficient unity and combination in the trade. This plan is offered to the druggists, and, if it be not accepted heartily and enforced vigorously, there is no doubt that it will be long years before any one will have the courage and conviction to propose any other method for the relief of the trade. Organization is the only way (as regards proprietary preparations) to place the business once more on a paying basis. We congratulate the druggists of Rhode Island upon their recognition of this fact, and would recommend to the profession in general that similar measures be adopted by the druggists in every town and city, and, if there be virtue in the proposition that the trade in patent medicines can be regulated, the matter can, through union of the trade, be quickly and satisfactorily put to the test.

TO INCREASE TRADE.

An all absorbing question is how to increase the trade of the retail drug store. The proper methods to be followed to attain this desirable end depend largely upon circumstances. Location of the store and the character of its trade must govern the nature of the measures to be followed to increase the trade. Some have found it possible to carry on a strictly legitimate pharmacy, dealing in nothing but drugs, medicines and compounding of prescriptions. In another locality, however, the druggist is obliged not only to carry patent medicines and sundries, but to call attention to the same by the distribution of suitable advertising matter. These two cases may possibly be regarded as the extremes. The professional side of pharmacy must to a greater or less extent be superseded in

many localities by the mercantile side, as there is not sufficient profit in the small prescription trade or legitimate pharmacy which can be there carried on to warrant close adherence to this professional side of the business. In fact, many druggists are of the opinion that with the progress of time, pharmacy in the United States will become less and less a profession, and more and more a trade, and it is true even now that the most successful pharmacists are those possessed of good business ability, and those who carry into the conduct of their drug stores the business principles of other lines of trade.

AN OUTRAGEOUS PROPOSITION.

The pharmacists of Ohio are receiving a petition and circular letter from the State Pharmaceutical Association, the latter reading:

"Dear Sir—The Committee on Pharmacy Law of the O. S. P. A. are obliged once again to make a fight for our rights in the state legislative hall, against senate bill No. 134, introduced by Senator Abbott, of Morgan county, who seems determined to have a bill passed that will practically repeal the present Pharmacy Law, which has stood the test for ten years and has been copied by twenty-seven states in the union. The change in his bill is that for three months on and after its passage the state be opened, and that everyone who had been engaged in a drug store for five years can register as a pharmacist or assistant pharmacist, as the case may be, without any examination whatsoever, which would, we believe, let in all the incompetents of the country, who have heretofore failed to pass the examination, and would fill our state with pharmacists (?) in name only and would greatly lower the present high standard of our profession in the estimation of the entire country, who now look to Ohio as a progressive State and most certainly not the one to take a step backward.

The passage of the proposed bill would be a great injustice to all who have made pharmacy a study and have qualified themselves and passed a successful examination before the State Board of Pharmacy. If the bars can be thrown down this year for three months, so can it be done next year, other years and forever, and in view of the above facts we wish to impress upon you the importance of immediate action and now ask you to call at once a meeting of your local druggists or get up a petition and have it signed by all of them and forward it at once to your State Senator at Columbus, to oppose the passage of Senate bill No. 134 by Mr. Abbott, at all hazards.

Should you be the only druggist in your town favorable to the defeat of said bill, write at once a personal letter to your Senator and use all influence you can bring upon him to oppose said bill. Do not delay in this matter, for a few days may make a big difference."

The petition bears the signatures of many prominent druggists who, after stating the belief "that the public safety and health require that the people should be protected from incompetent pharmacists, and assistant pharmacists, and that no person who has not been found competent upon examination by the State Board of Pharmacy, shall be permitted to compound medicine, prepare the prescriptions of physicians, or sell at retail for medicinal purposes, any drugs, medicine or

poisons, respectfully pray that the present pharmacy law be not amended as proposed by Senator Abbott's Senate bill No. 134."

The newspapers of the state are, at least many of them, outspoken in condemnation of the proposed measure. The so-called amendment simply means a total undoing of the pharmacy law, that has been enacted through the efforts of the best men in the profession all over the state. The public scarcely realizes that the responsibility of a druggist is nearly as great as that of the physician, whose prescriptions he fills. It is the duty of the pharmacist to know when he sends out a prescription that it is not capable of producing poisonous effects in the prescribed dose, and a part of his business is to look for these little accidents. Moreover it occasionally happens that even the best of pharmacists may also make a mistake. How much more frequently would errors be likely to occur, then, at the hands of incompetent men. It is to be regretted that such a worse than useless bill, should cause such a waste of time and money among pharmacists all over the state.

PILLS OF OLEATE OF MERCURY.—

From La Med. Sci. the Nat. Dr. abstracts a method proposed by Quinquand and Portes: "Dissolve in a sufficient quantity of water, 30 grams of medicinal soap and then precipitate by the addition of salt water; decant and repeat the operation several times. Cast on a bit of oil cloth and wash very lightly with distilled water, and finally dissolve the soapy residue in a large quantity of water. In another vessel dissolve 13 grams of 50 centigrams of bichloride of mercury in 50 centigrams of distilled water and mix the two solutions with constant agitation. At the end of several hours collect the precipitated oleate of mercury, wash by malaxation and preserve in parchment paper, kept carefully from the light. The pills are made with this oleate and licorice, and should be immediately coated with melted salol. Each pill should contain 15 centigrams of the oleate, representing about 4 centigrams of metallic mercury. Pills thus prepared are free from all the defects and bad effects of the oleate otherwise prepared, as they do not disturb the gastric functions, and are absorbed in the intestine. They are especially valuable in the treatment of syphilis and syphilitic affections."

ANALYSTS' REPORTS.—In a legal case in England involving the quality of a certain brand of rum, the analyst reported: "I estimate the sample of rum to contain an excess of water over and above that allowed by act of Parliament, I am of opinion that the sample is not a sample of genuine rum." The bench declined to convict, on the ground that the word "estimate" was used instead of "find." An appeal was taken by the prosecutor, but the appeal was dismissed.

UNIVERSAL PILL EXCIPIENT.—N. A. Upham told his fellow members of the Connecticut Pharmaceutical Association that the following excipient would prove satisfactory in the majority of cases. He mixes together 1 dram of powdered acacia and 2 drams powdered tragacanth and thoroughly incorporates 5 drams glucose and 2 ounces glycerine, finally stirring gently to thicken. The product is kept in a well-covered jar.

[Written for the Era.]

PHARMACOLOGY—ITS SCOPE AND THE METHODS OF TEACHING IT.

By J. O. Schlotterbeck, Ph. C., B. S., Instructor in Pharmacology and in Botany, in charge of *Materia Medica*, University of Michigan, School of Pharmacy.

INTRODUCTORY.

We are continually reminded of the great advancement of science by the ever increasing demand for better and higher education in all lines of commercial and professional activity. In order that pharmacy may keep pace with this onward movement and maintain its position among the nobler professions, it is obvious that the educational standard of the calling must be raised. The greater the intellectual enlightenment of an individual, the higher his position in the social world. So also we may assert that the greater the scientific requirements of a profession, the more exalted its position in the world of science.

The present status of pharmacy may be largely attributed to its overcrowded condition; and it is an undeniable fact that the ease with which candidates are officially declared competent to assume and perform the responsible duties of the pharmacist is, in a great measure, the source of the evil. As has been voiced many times, the only remedy for this bane of incompetency is to raise the standard of education so that only those who can pursue the approved courses of pharmaceutical study intelligently and satisfactorily may be allowed to follow the calling.

Since American pharmacy is not, as in some other countries, under government control, there is consequently little hope for reform from that direction. The national and state pharmaceutical associations have accomplished much good, and can do a great deal more in bringing about the much desired reformation. They should investigate the nature and the amount of the instruction given, and high standards of requirement should be established for entrance to and graduation from schools of pharmacy. By using their united influence for the enactment of proper legislation, these bodies may aid materially in lifting up the profession to that lofty position where it naturally belongs.

It is universally admitted that the individual courses of instruction in any institution cannot be woven into satisfactory and symmetrical curriculum without frequent consultations by the teachers for the purpose of exchanging their views and discussing new ideas. As the old maxim has it: "Two heads are always better than one." In order that pharmaceutical education as a unit may be of the highest excellence, it also becomes necessary for the individual institutions to throw aside prejudices and self-centered motives, and to compare and discuss their plans of instruction, a course which would result in the eventual improvement of them all.

Let us consider for a moment all the schools of pharmacy in the United States combined into one grand institution. This one institution would have but one purpose in view, and that the proper equipment of the student who intends to follow this profession. Now let us observe carefully if the theoretical preparation of the students leaving this institution is of a uniform character, as in-

dedicated by their diplomas. As at present conducted do we notice any uniformity in the excellence and thoroughness of the instruction? This question requires no answer; it is only too obvious. It is reasonable, then, to expect any uniform proficiency in the graduate with such flagrant deficiencies in the methods of teaching? Here lies the key to the whole situation. The entire profession, and not a small fraction of it, must be elevated in order to do appreciable good. Without discussing the causes of these inequalities any further, suffice it to say, that the quality and not the quantity of graduates is the important factor in the solution of this vexing problem.

It has been suggested that a portion of the time allotted to the section on pharmaceutical education and legislation in the American Pharmaceutical Association might profitably be devoted to the explanation by the teachers of the methods of teaching in vogue in their various institutions. For various reasons this would not be altogether practicable. Not much headway could be gained in so short a time. No better plan presents itself than the expounding of the question through the columns of the pharmaceutical press. Since we have motives in common, we have no secrets in our methods of instruction. Accordingly, without attempting to say what an ideal course of pharmacology shall consist of, the writer will merely explain as comprehensively as possible the method of instruction employed in the School of Pharmacy of the University of Michigan. The course as outlined is by no means entirely satisfactory, but efforts are constantly being made to improve it. This paper will have accomplished its purpose if others will be stimulated to make public their methods of teaching, thus giving information which will be of benefit to all concerned.

By way of introduction, it may be well to review briefly the scope and history of pharmacology.

Of the three related sciences, botany, *materia medica*, and pharmacology, the latter, as indicating a distinct branch of knowledge essentially pharmaceutical, has never received the popular recognition accorded the former two. *Materia medica* and pharmacology are often used in the same sense. Perhaps botany is more explicitly defined than either of the other two. *Materia medica* has been an uncertain expression, as is demonstrated by the variety of definitions given of it in the numerous works upon the subject. Because of this elasticity, the term is used rather loosely, and frequently to cover odds and ends in college curricula. In England, pharmacology and *materia medica* are employed synonymously with pharmacology. In this country general *materia medica*, *materia medica* proper, and pharmacology cause no little confusion, so that we are frequently asked to define them.

In the present accepted use of the term, general *materia medica* embraces everything relating to remedies employed in the treatment of disease. This would naturally include a complete description of the origin of the drugs, their physical and chemical properties, their physiological actions, and therapeutic uses, and the methods of preparing, combining and dispensing them. While we still occasionally hear of individuals professing to impart knowledge upon so many differ-

ent branches of study, it is contrary to the growing tendency toward specialization and concentration. The successful teachers and workers of to-day are those who devote their undivided attention in some special direction.

The necessity for a division of labor in general *materia medica* became apparent long ago, and a division of science followed in consequence. As a result, we have embraced in the scope of general *materia medica*:

I. Pharmacology—often called *materia medica* proper—which is the scientific study of drugs.

II. Pharmacology—(Pharmacodynamics)—which treats of the physiological action of drugs.

III. Pharmacy Proper.—The science and art of properly preparing, combining and dispensing drugs.

IV. Therapeutics.—The science which treats of the uses of drugs for the prevention and cure of disease.

Since the main duty of the pharmacist is to furnish authentic drugs of unquestioned purity and quality, and to select, prepare and dispense them properly, it at once becomes evident that of the above applied sciences those of pharmacology and pharmacy proper, form the foundation of his profession. These are, of course, in turn based upon a liberal training in chemistry (general, organic and analytical), botany (systematic and anatomical), and physics. Should we not add to these pharmacology, which, as stated, treats of the physiological effects of drugs?

Pharmacology is taught at the School of Pharmacy in quite as detailed a manner as in many medical colleges, while it purports to give but a general survey of therapeutics. It might be said that a knowledge of physiology is indispensable, but thanks to the excellent instruction given in most high schools where the majority of students in this school have been prepared, they are generally well equipped in this respect. As an evidence of the practical benefit of this training in pharmacology, I may be permitted to mention the fact that former students and graduates continually testify to its importance in the successful practice of pharmacy. In degree of importance they place it on a par with pharmacology and pharmacy proper. It is a stimulant to mental application and forms a sound basis for scientific attainments.

It hardly seems reasonable that the pharmacist should be pardoned for being ignorant of the physiological action of such important drugs as opium and nuxvomica, any more than we should excuse the physician who is unacquainted with the composition of the remedies he prescribes.

Doses and antidotes to poisons then become logical deductions instead of so many abstract facts learned by rote. The pharmacist and physician should supplement each other to a large extent. In order to do this the pharmacist ought to possess a fair acquaintance with the principles of pharmacology, and it is equally important that the physician have a knowledge of drugs and the methods of preparing them.

It will be readily appreciated that the physiological action of a drug determines to some degree its value, and consequently pharmacology may eventually extend the compass of pharmacology so as to be included by it.

WHAT IS PHARMACOLOGY?

From the close of the seventeenth century to the beginning of the nineteenth, separate works upon the scientific study of drugs appeared, but they bore no uniform titles and recognized no distinctive term for that branch of science. The only definite information that we possess regarding the introduction of the expression pharmacology was obtained from the title, "Grundriss der Pharmakognosie des Pflanzenreichs," a work published by Ch. Martius in 1822; and five years later the name received favorable recognition, owing to the lectures delivered at the University of Erlangen by the author of that work.

Martius defined pharmacology as "that branch of general materia medica which treats of the examination of medicinal substances obtained from the three kingdoms of nature, with a view to ascertaining their source and quality, to test them for purity and to determine substitutions and adulterations." After a careful analysis it becomes manifest that the scope of pharmacology, as at present understood, is practically embodied in this definition. Exception might properly be taken to restricting the study to purely medicinal substances, since many drugs for which the pharmacist is held responsible to the people are rarely, if ever, used medicinally. It would be drawing the lines too finely to exclude such substances as logwood and catechu, which are employed mainly in the industrial arts. The same is true of cinnamon, pepper and allspice, whose medicinal applications are insignificant compared with their use as condiments. The words "drugs and medicines" may properly be substituted for "medicinal substances" in the definition given by Martius.

Since the vegetable kingdom supplies by far the greatest number of drugs and medicines, it follows that botany must form an important aid to pharmacology, although, strictly speaking, not a part of it. Systematic botany is of vast importance, since by its principles we are enabled to describe and classify plants with accuracy, and also to form mental pictures of them from their descriptions. It affords a means of determining plant organs, and of distinguishing those that are closely related. The identification of drugs and their adulterants by appearance alone becomes possible in many cases.

In the early days, when the pharmacist powdered his own roots, barks, and herbs, it was a comparatively easy matter for him to determine their genuineness and quality. The means that served then for protection against fraud will not entirely suffice now, since the majority of drugs are furnished ready powdered in all degrees of fineness. The pharmacist must still vouch for the quality of his goods as formerly, and it becomes, therefore, a matter of serious perplexity.

The form, color and properties of plants and plant organs are not constant, as is the case with chemical compounds. Owing to geographical distribution, climatic conditions, the nature and quality of soil, and different methods of collecting and drying, the external features may vary considerably. Recognition by physical characteristics alone, then, is not always practicable or even possible. One may become so familiar with the external

characteristics of certain drug specimens that he can always recognize them among others, provided these features have not been altered in any way; but this kind of knowledge is sadly at fault when the length, diameter, shade of color, and surface markings give to the drug a marked change of appearance. One acquainted with the gross anatomical features could often establish the identity of important drugs at a single glance. For the satisfactory study of crude drugs, then, plant anatomy becomes indispensable.

The credit for having extended the scope of pharmacology to include the microscopic examinations of drugs must be given to Schleiden. The minute structures with their manifold markings are constant factors, and become visible only under the compound microscope. The magnificent photographic reproductions of drug sections in Berg's Atlas, and the excellent free hand drawings of plant structures in Moeller's Pharmakognostischer Atlas, are taken from typically average samples of unquestioned reliability. They are especially valuable for comparison, since they obviate the expense and difficulty in obtaining genuine specimens.

Although the gross features of a drug are destroyed by powdering, the microscopic characteristics remain partially or entirely intact, and the recognition of the whole follows the identification of its parts. Pharmacists can not be urged too much to employ the microscope, which is not only necessary but also an incentive to scientific attainments. It will also in a pecuniary way yield a handsome revenue, for what is to prevent the pharmacist from becoming a public analyst, food inspector, or consulting chemist for some technological enterprise.

The quality of many drugs depends solely upon the amount of active constituents present. Indeed the large manufacturing concerns purchase drugs largely upon assay, leaving out of consideration external features; for it is often the case that general appearances would indicate superior quality when in reality assay proved it to be the contrary. The quantitative determination of active constituents, by gravimetric and volumetric methods, can therefore properly extend into the domain of pharmacology.

Again, the value of a drug is generally based upon the chemical constituents and their qualities. It is not sufficient merely to mention the principles without any reference to their nature, properties, and chemical behavior. That would be as useful to the pharmacist as hundreds of botanical names without any knowledge of the plants they designate. The chemistry of plant constituents must be taken up for consideration by classes and groups. But the botanical and chemical side of pharmacology cannot be satisfactorily taught together in one and the same course. Not that one person would not be competent to teach both, but the classifications being unlike could not conform to each other. They could be treated together if the plants of a certain order or class contained principles in common, but such is rarely the case.

A division into botanical and chemical pharmacology is the only expedient, and ought to be taught by two instructors. Such is the division that is made

in this School of Pharmacy. Since the writer gives instruction in only the botanical side it forms the subject of his discussion.

In conclusion, let it be said that the study of pharmacology will remain incomplete if a general idea of the history, geographical distribution, culture and methods of collecting and drying be not given. Indeed there are a number of instances in which a thorough study of these points becomes of vital importance in determining the nature and quality of the drug. (To be continued.)

(Written for the Era)

THE STATUS OF THE DRUGGIST.

By Albert Henry.

When at a mental distance sufficient to afford us a perspective of just proportion, we contemplate the various occupations followed by the units of the sum of civilized humanity, we cannot fail to be doubly impressed with the truth of the aphorism that "all labor is honorable." Among the various occupations of mankind demanding for their fullest accomplishment intellectual parts above the average and a high moral stamina, few occupy the plane of the druggist. The secrets of nature, the mysteries of the field, the forest and the mine, these form his labors. Each toiler can inspire himself, no matter what his task, by ordering his thoughts to dignify the work that is his; but to my mind the druggist has a deeper reason than many to so conduct himself and his profession that he of himself may uphold the calling in honor. The profession of medicine is so closely knit with the physical well-being of the people that a perversion of its purpose by one of its disciples is productive of the most pernicious consequences to the moral health of a community. America is so very free that good men have no limitation placed upon their efforts to benefit their kind, but that very freedom is also extended to the conscienceless pander to foster vice, to be the hireling of immorality and to glut the desire of the unfortunate inebriate, giving him, in fact, the freedom to evade wise laws for the protection of the weak from the temptation of their lusts.

In an article in this journal some time ago I gave some instances which had come under my observation of the evil effects which resulted to the members of the College of Physicians and Surgeons of London, England, from hiring professional informers to spy upon druggists who prescribed for patients without being duly accredited physicians. Yet there was no doubt that many druggists were in the habit of prescribing—and this practice is as harshly condemned by reputable druggists as it is by the physician—yet in America it is a very common thing, the temptation being the greater with the discovery of new remedies, particularly hypnotics.

The prescribing by druggists is of secondary importance to the practice of selling liquor without a license. In a suburb of Chicago, Englewood, druggists have made a practice of selling to all, and on Sunday to a degree that the church organizations lately began a most determined crusade against the culprits. Five druggists were arrested for selling liquor without a license, the stores of those arrested having degenerated into mere drinking saloons.

What condition of things could be more

depressing to the druggist who honors his profession? Yet we have not far to seek to discern the reason of the evil. One word tells the story—competition. This is the gist of my argument. Competition may be the life of trade, but competition affects the life of the people too closely for it to be permitted to become too fierce in the drug trade. This is very fully realized in Germany, where the druggists must not only be fully qualified, but licenses will only be granted by the state to a certain number in each district, according to population, as prescribed by law. I do not know that any reform can be hoped for in America looking to a limitation of druggists to certain districts, but a movement in that direction would certainly be in the interest of the druggists themselves as well as that of the general public.

At a recent meeting in Chicago of a number of physicians the question of raising the standard of preliminary studies for candidates for the profession of medicine was discussed and reported on favorably. In this there is a suggestion which druggists should regard heedfully. More than ever before should the dispenser of medicine be a student of wide research and withal a man conscientious in his duties to his fellow men. As the mysteries of nature are laid bare by modern enterprise and skill, greater opportunities are placed in the hands of the unscrupulous to pervert blessings to the most ignoble uses. Every druggist who has time to turn his attention from the competition that is making him a hand-to-hand fight for existence, cannot fail to note seriously the growing magnitude of the problem that is looming before the profession. What restriction is desirable? How will it interfere with public convenience? How will it be accomplished, and what is the opposition?

In another paper I hope to take this matter up with some practical illustrations now being collected.

THE MISSION OF PHARMACEUTICAL SCHOOLS.*

By F. B. Power.

The aim of pharmaceutical schools should be to afford a broad and thorough training in the sciences pertaining to pharmacy, or in those branches of natural science, theoretical and applied, upon which the successful practice of pharmacy depends, such as general and pharmaceutical chemistry (including chemical analysis), elementary physics, botany and pharmacognosy. These branches may and should, when possible, be supplemented by such other closely related and useful studies as bacteriology, hygiene, etc. The so-called art of pharmacy, in its generally understood application to pharmaceutical manipulations, can only be properly learned in the daily work of a well-regulated and legitimately conducted pharmacy, and I believe it to be a mistake and an evidence of abnormal conditions when the training of this character is relegated exclusively to the schools.

The primary and most essential requisites of a competent pharmacist must, therefore, be conceded to be such a thorough professional training as to enable him both to prepare and dispense medi-

cines with care and accuracy. Constant care must be exercised to avoid mistakes, and the conscientious pharmacist will always aim to have the assurance that every drug or preparation which he dispenses is authentic, pure and of the proper character and strength. The range of knowledge involved in the faithful execution of these responsible duties, often required to be performed amid distractions of the mind or weariness of the body, is greater than may at first be apparent to a superficial observer. It is, indeed, precisely the constant practical application of the scientific and technical knowledge which it is the mission of schools of pharmacy to impart.

A representation of the character and attainments of pharmaceutical schools, or of the aspects of modern pharmacy, which does not also take into consideration their shortcomings and defects would, moreover, be unduly optimistic. Between the cherished ideals and the conditions which confront us there lie indeed not a few obstacles, but it is believed that these are not insuperable, and that the higher education of the pharmacist would be capable of effecting many of the desired reforms. In a country dominated by a spirit of freedom like our own, this can, perhaps, only be accomplished by the creation of a class of thoroughly educated and specially trained pharmacists, who may be recognized by the public as such, as distinguished from those who can neither desire nor claim professional responsibility, but to whom would be cheerfully relegated the privilege of dealing in patent medicines and all the notions of the modern bazaar, with whatever emoluments such a trade may bring. The greatest need of pharmacy to-day, as of other professions, is men, and by this I mean not only intelligent and educated men, of whom we have a good proportion, but those who have sound and just convictions, which they are fearless to express, and are willing openly to confront the evils which tend to nullify the best educational efforts, or even undermine the very foundations upon which all hopes of progress may rest.

One of the evils to which I refer is the plan adopted by a pharmaceutical college in one of our largest cities reducing the time for technical or scientific study to a period much below that which for years has been considered the minimum requirement, instead of seeking to broaden the requirements and elevate the standard. A student is thus permitted to graduate after two short courses of between three and four months each, receiving a degree which in this university, and in some other universities, it is only thought proper to bestow after a course of study extending through two complete academic years, and for which almost every other college of pharmacy in our land now requires an attendance upon two annual courses of instruction of at least five or six months' duration. That such a short road to an assumed proficiency is alluring to a certain class of students is self-evident, and the motives for such a scheme are also apparent. It is only to be deplored that so many can be led to believe that the mere possession of an easily earned diploma is in any sense commensurate in value with the acquisition of substantial and lasting knowledge. The success of which such an institution may boast must naturally be based, not upon the character and qual-

ity of its students and their work, but upon the numbers that are enrolled.

Another evil to which attention cannot too often be directed is the pernicious influence upon sound education of the small compilations known as "Quiz Compends," "Essentials," published "Lecture Notes," etc., which are designed as short cuts to knowledge, or as aids in "cramming" for the examinations of either state boards or professional schools. By the use of such material, often specially arranged to facilitate memorizing, a student may and often does attain the desired end, which is to slip through an examination with the least possible expenditure of time, effort and study. The knowledge thus acquired is, however, not the true grain, but the chaff, which soon vanishes, leaving him who possessed it empty minded and at a great disadvantage in the competition of life.

In our national and state pharmaceutical associations there is evidently room for improvement in many directions, and in some particulars the most urgent need of reform. With regard to the current literature of American pharmacy, as represented by its various periodicals, it must also be said, with a few notable exceptions, it has by no means reached the highest ethical standard, and in some instances it would be difficult to discern any endeavor to sustain such a standard at all.

The improvement of all these special conditions to which I have referred, no less than the elevation of the general professional standard through the influences of education, may be included within the proper sphere and mission of pharmaceutical schools, and those schools will achieve the highest true success which recognize and fulfill this obligation and trust. It is, however, only when a proper preliminary education is demanded of those who enter the pharmaceutical schools, and when this is supplemented by sound, thorough, scientific training, that pharmacy can be expected to take its rightful place among the professions.

HOMEMADE CELLULOID.—Scientific American gives a formula to make a substance as transparent as pure glass, at the same time very pliable and strong. Dissolve four to eight parts of gun cotton in a mixture of alcohol and ether, in proportion of one of gun cotton to one hundred of the combined liquid, after which add two to ten per cent of castor oil, or any other oil unisicative, and four to ten per cent of Canada balsam. Flow this mixture on to a glass plate and dry in a current of air at 50°. The result is a leaf of hard substance, transparent, nearly unbreakable, and resisting the action of all salts, acids and alkalies.

INCUBATION PERIODS OF INFECTIOUS DISEASES.—The Clinical Society of London has made extensive observations and has compiled the following table showing the number of days of incubation of the infectious diseases named:

	Normal.	Maxi-	Mini-
	num.	num.	num.
Variola	12	14	9
Varicella	14	19	13
Measles	10	14	4
Rubella	18	21	8
Scarlet Fever.....	2	7	1
Influenza	3	5	1
Diphtheria	2	7	2
Typhoid Fever.....	12	23	5
Mumps	19	25	12

*Abstract from an address delivered before the graduating class of the School of Pharmacy of the University of Wisconsin, 1888.—Pharm. Rundschau. (W. Dr.)

[Written for the Era.]

CRYPTOGAMS.

A Short Descriptive and Analytical Scheme.
By L. Sollman.

Any one wishing to make original investigations in a field easy of access and fruitful of results can find much of interest in the cryptogams. Whilst the higher families, such as ferns and mosses, are fairly well known, this is not the case with the smaller fungi, algae, bacilli, etc.

The following scheme is by no means considered final. It has, however, the advantage that it covers and clears a field the view of which is certainly hazy to most botanists and naturalists.

By referring to the illustrations under the respective figures (e. c. Filices, Fig. I), there may be found a graphic explanation of technical terms.

CRYPTOGAMS,—plants with or without chlorophyl, without anthers or pistils, propagating by spores or cell division.

1. Pteridophytes: Plants with woody fibers, first generation spore or spores growing into antheridia and archegonia on a separate plant (proto plant).

(A) Antheridia and archegonia arising from one kind of spore.

Equisetaceae.

Filices. Fig. I.

Ophloglossae.

Lycopodiaceae.

(B) Antheridia and archegonia arising from two kind of spores.

Sellaginellaceae.

Marsillaceae.

Salvinaceae.

2. Eryophytes: Plants with cellular tissue only, both archegonia and antheridia growing on the original plant.

(A) Propagating by antheridia and archegonia only.

1. Thallose, capsules opening irregularly, containing spores mingled with elaters. Hepaticae or Liverworts. Fig. II. F. (A detailed analysis of cryptogams up to this class may be found in Gray's Manual of Botany.)

2. Never thallose, capsules opening by a lid and containing spores only.

Musci, Fig. II.

Mosses.

(B) Growing in stalk and leaflike plants (composed of tubular cells at the joints) antheridia and archegonia producing oospores.

Characeae, Fig. III.

(C) Producing (besides antheridia and archegonia) by subdivision so-called tetraspores.

Tetrasporaeae. Irish Moss, Fig. IV.

3. Thallophytes: Cellular plants, mostly without chlorophyl, cells changing directly into spores without the intervention of much specialized organs.

(A) Thallus with or without chlorophyl, propagation by zoospores, i. e., an ordinary cell, without fructification, produces ciliated spores capable of germinating.

Zoosporeae, Fig. V.

(B) Thallus various shaped, composed of single cells. Propagation by zoospores, i. e., two cells of the same kind touch and by segmentation form between them a new cell which gives rise to zoospores ready to germinate.

Zygosporaeae, Figs. VI. and VII.

Mucoreae, Diatoms.

(C) Spores, generally four, produced on a basidium, the latter resting on a hymenium.—Hymenomyces. Fig. XI. Many edible mushrooms.

(D) Basidia contained in a sac (peridium) by the bursting of which they are set free.—Gasteromyces. Fig. XI.

(E) Spores are formed inside of a cell; the peridium in form of a tuber. This is transversed by many channeled veins, in the walls of which are embedded the cell tubes. Cells are set free by the rotting of the peridium.—Tuberaceae. Fig. XIII. Truffles.

(F) Spore tubes and paraphyses (hair cells) contained on the inside wall of a bottle-shaped cavity (perithecium). Spore tubes contain eight spores which issue from the mouth of the perithecium. Some, besides, possess free basidia, called conidia, other bags containing basidia. When the spores of the latter are fertile they are called "spermagonia," when sterile, "pyknidia." Pyrenomyces. Fig. X. Ergot.

(G) Spores, etc., like in the previous class, but spore tubes borne on a disc, instead of a perithecium.—Discomycetes.

(H) Spores of two kinds found on basidia: 1. Uredospores ready to germinate at once; 2. Teleutospores after a winter's rest. Mycelium formed on inside the plant on which it feeds. Spores on ripening break through the epidermis.—Uridineae. Fig. XV. Rust.

(I) Mycelium contained inside the plant, on which it is parasitic. Spores set free by the breaking up of the plant.—Ustilagineae.

(K) A slimy, apparently structureless protoplasmic mass, raising on its surface membranous bags, which break up into globular cells.—Myxomyces.

(L) Structureless cells multiplying by spreading.—Cryptococcae. Fig. XIV. Yeast.

(M) Multiplying by subdivision, one celled.—Schizophytae. Fig. VIII. Bacteria.

4. Plants with a double structure, one being parasitic and in the organs called apothecia resembling closely the pyrenomyces, the other containing chlorophyl, which produces and reproduces by gonidia.—Lichenes. Fig. IX. Iceland moss.

DESCRIPTION OF THE PLATES.

Fig. I.—Filices.

- A. Part of a frond showing sori; No. 1.
- B. Crosscut of sorus, showing indusium. No. 1. Sporangia No. 2.
- C. Sporangium enlarged, discharging spores which grow into
- D. Protothallus, with rootlets showing archegonium No. 1., antheridia No. 2.
- E. Antheridium spore enlarged.
- F. Embryo in archegonium, from which germinates.
- G. Young fern plant.

Fig. II.—Musci.

- A. A female stalk with a capsule covered by cap.
- B. Rippe capsule showing peristome. No. 1.
- C. Male stalk with antheridia. No. 1.
- D. Antheridium with leaflets 1; paraphyses 2; antheridia 3.

E. Capsule of muscus with lid. No. 1.

F. Capsule of hepatica, valved, with discharged spores No. 1. Elaters No. 2.

Fig. III.—Characeae.

- A. Stalk.
- B. One knot of same enlarged, showing antheridium 1; sporangium 2.
- C. Sporangium enlarged.

Fig. IV.—Tetrasporaeae. Trichogynium No. 1, fructified by antheridium No. 2.

Fig. V.—Zoosporeae. Self-fertilized cells, containing spores No. 1; ciliated zoospores No. 2.

Figs. VI, VII.—Zygosporaeae. Showing three styles of copulation. A. spirogyra; B. rhizopoa; C. desmidia.

Fig. VIII.—Schizophyta.

- A. Bacteria.
- B. Bacilli.
- C. and D. Spirilla.

Fig. IX.—Lichenes.

- A. Thallus of lichen with apothecia 1.
- B. Crosscut of apothecium gonidium layer No. 1. Disc. No. 2.
- C. Part of disc enlarged. Spore tubes No. 1. Paraphyses No. 2.
- D. Gonidium layer, enlarged gonidia No. 1.

Fig. X.—Pyrenomyces. Claviceps purpurea.

- A. Sound ovary of rye.
- B. Changed into conidia bearing stroma 1.
- C. Crosscut of stroma, showing conidia discharging spores.
- D. Stroma changing at bottom into sclerotium.
- E. Sclerotium, with remains of stroma 1.
- F. Sclerotium sprouting into a sporangium 1.
- G. Crosscut of sporangium enlarged, showing the perithecia.
- H. Crosscut of the perithecium, showing spore tubes.

1. Spore tube discharging spores.

Fig. XI.—Hymenium of an agaricus.

- A. 1, cap; 2, lamellae; 3, ring; 4, stalk; 5, valva; 6, root; 7, mycelium.
- B. Crosscut of a lamella, showing: A, basidia; B, spores.

Fig. XII.—Gasteromyces.

- A. Natural size. Bovista forming a peridium.
- B. Fibre contained in same, forming the base for the
- C. Basidia and spores.

Fig. XIII.—Tuberaceae.

- A. Crosscut of a truffle, showing the veins 1.
- B. Crosscut of a vein whose walls contain the spore tubes 1.

Fig. XIV.—Yeast plant, sprouting.

Fig. XV.—Uredineae, grain rust.

- A. Teleutospores sprouting into a conidia.
- B. Mycelium producing teleutospores No. 1, uredospores No. 2.

WEAK SPIRIT OF NITROUS ETHER
—Some English chemists seem to have the same bad habits that a few American pharmacists have, in that they keep two grades of articles for sale. A public analyst got after one of the former recently and found his spirit of nitrous ether very deficient in strength. The pharmacist said that if he had known that the article was to be subjected to analysis he would have responded to the demand for a sample with the contents of another bottle.

[Written for the Era.]

GINSENG.

Panax ginseng, Aralia quinquefolia.
Chinese Man Root.

By George Stanton, Summit Station, N. Y.

There is no plant or root known to the medical faculty of more commercial value to the American people than ginseng, while its medicinal value is rated the lowest of anything in *materia medica* by the profession in America and Europe. But for the foreign demand this root would not be worth five cents a pound in this country. In 1890 the writer shipped a barrel of ginseng (60 pounds) to New York and received in return a check for \$25.

Ginseng was first discovered in Canada in 1716. The export trade commenced in 1718 and soon developed an extensive business. In 1835 the shipments of the root from the United States amounted to 407,067 pounds, valued at \$39,303, less than 25 cents a pound. In 1858 and '59 the ginseng trade in one county in Wisconsin is reported to have reached the sum of \$120,000. Immense quantities have been exported from Minnesota. The exportation of ginseng from this country for twenty years prior to 1884 averaged about 400,000 pounds a year. During ten years, 1882-1891, the exportation from the United States amounted to 3,888,206 pounds, value \$7,773,996. The above figures give some idea of the commercial value of this root in this country.

Ginseng is found in our hardwood forests throughout most of the states east of the Rocky Mountains, but it is fast becoming exhausted in this country, reports coming from all sections stating that it is becoming extinct. Ginseng is also native in China, Tartary and Corea, but is nearly exhausted in these countries. It is known to have been used as medicine in China for at least five hundred years. Williams, in his "Middle Kingdom," second edition, says, on page 967: "Ginseng is found wild in the forests of Manchuria, where it is collected by detachments of soldiers detailed for this purpose; these regions are regarded as Imperial preserves, and the medicine is held as a government monopoly. The importation of the American root does not interfere to a serious degree with the Imperial sales, as the Chinese are

fully convinced that their own plant is far superior." Ten thousand soldiers have been employed gathering the root at one time; each of these collectors, in the year 1709, was bound to furnish two ounces free, the rest he could sell to the emperor for its weight in silver. Roots having the form of the human body could be sold for their weight in gold. Single roots of this form often bring from \$30 to \$400. The "kilt-edged" ginseng of Corea and Manchuria often sells in China for \$700 and \$800 a pound. The following item from a trade paper, May 1st, 1889, is of interest in this connection: "An example of the cost of the medicinal root ginseng is afforded by a recent *Pekin Gazette*, which contains a report from the military governor of Kirin, in Manchuria, stating that he has forwarded for the use of the Emperor by special messenger eight large and sixteen small ginsengs, weighing altogether 9.4 ounces. The total cost is given at 1,560 taels, or about \$400, being at the rate of about 42¢ an ounce. What is the magic charm about this root that commands such price? Panacea for all the ills to which human flesh is heir, cure-all for mind and body. The Chinese do not seem to base their estimate of value upon the chemical properties of the root, but reason in this wise: That a root and plant which attains such great age and so often resemble the form of the human body must possess supernatural powers, and that they are capable of imparting their virtues to the human body; hence, if they eat such roots, they will restore vigor, ward off disease and prolong life to extreme old age. Ginseng is also regarded as a cure for barrenness and tending to produce male children,

the greatest blessing the Chinese father can hope for. The Chinese doctors assert that it gives ready relief in extreme fatigue, renders respiration easy, strengthens the stomach and gives vigorous tone of body even in extreme old age."

It has been asserted that the Chinese claim that the forest home of the ginseng is guarded by the lion, the tiger and the rattlesnake, and that the roots utter groans and protestations when being dug, and have power to crawl back into the ground. It is supposed by many that ginseng is narcotic in its effects and creates an abnormal appetite. This is not correct; it is neither narcotic or stimulant, but a mild tonic. In Japan and China the roots are subjected to a process of clarifying, which consists in boiling them five minutes in a liquid especially prepared. To ten gallons of water is added $\frac{2}{3}$ ounce of clarified ginseng, $3\frac{1}{2}$ ounces of licorice root and $3\frac{1}{2}$ ounces of shai-shin (a drug). When the water becomes brownish the residue of these substances is removed and about one quart of alcohol is added. The roots, after being carefully washed and trimmed, are graded according to size and quality into from five to seven grades and placed upside down in bamboo baskets containing about $8\frac{1}{2}$ pounds. The baskets, commencing with the lower grades, are placed for five minutes in the liquid, which is boiling, then dipped in cold water and dried, either in open air or kiln dried according to weather. After ten baskets of roots have been treated, the liquid should be renewed. I have a sample of ginseng cultivated in Japan and clarified. The roots are about two inches long. They are old and worm-eaten, yellowish, candied, and crumbly when cut. These samples were sent me by Mr. T. A. Bronson, of New York. He writes me that they were imported from Japan for the purpose of mixing with our native roots.

As a botanical study, ginseng is a very interesting plant. It is generally described as fifteen-leaved. This is not correct. It is found with all the way from 3 to 25 leaves, according to age and vigor of root. The plant makes its appearance in northern New York about the first of May. It comes out of the ground entire in all its parts, foliage, seed-head and buds. The plant develops quite rapidly until about the first of July, when it reaches maturity and the flowers appear. They are small, with green center and five small white petals. The blossom is scarcely visible to the naked eye, but under the magnifying glass is very interesting. The flowers are soon followed by green berries, which ripen from the 15th of August to the 15th of September, and when ripe are bright scarlet with soft, pulpy flesh, taste pleasant, sweetish, bitter. Each berry contains from one to three large, rough, white, hard-shelled seeds. The berries range in size from a small pea to a medium bean, round, oval, or triangular in shape, according to the number of seeds. Soon after ripening the berries fall to the ground and are covered by the leaves of the forest. After about eighteen months they send up a small, three-leaved plant, producing a root the first season but little larger than a good, plump oat. It is several years before the root develops a seed-bearing plant. Ginseng is of slow growth and attains great age; roots are often found thirty to forty and even fifty years old.

The age is indicated by the notches on the neck of the root formed by each year's stalk, each year adding to the length of the neck, very old roots having necks from five to six inches long. Old roots are not always large, 15 or 20 years often developing much larger roots than some that are 40 or 50 years of age. The Chinese and Indian name, "Man root," is not inappropriate, for like man when old it loses its vigor and vitality. I have often heard it claimed by ginseng hunters that roots had been found weighing 20 ounces and even more. The largest roots I have ever seen weighed 6½ ounces green. Two to three ounces are considered large roots.

In gathering for market, care should be taken not to injure the roots, as the larger, more perfect and entire, the greater the value. They should be thoroughly washed as soon as practicable, with brush or broom, and dried either in sunshine or by moderate heat, but care must be taken not to overheat. It should not be dug until after the seed has ripened, or about the first of September. The increase in price and demand during the past few years, with the decrease in supply, have naturally called out many inquiries in regard to the cultivation of this valuable root. Many unsuccessful efforts have been made to develop its culture in this country, until the prevailing impression is that it cannot be done. The cause of failure, no doubt, was owing to the fact that the parties making the trial were not familiar with the natural habits and requirements of the plant. My own experience in this line the first year was very unsatisfactory. The seeds did not germinate and the plants, from about 200 roots set in autumn of 1886 made a very poor showing. During the season of 1887 the outlook was so very discouraging that I abandoned the project and pronounced it a failure, but in 1888 my plants made fair growth and gave better promise of success. I then made a careful study of the habits and requirements of the plant. The experience thus gained has enabled me to so improve my methods of culture that success is now an assured fact. A few figures will show the possibilities in ginseng culture.

The combined product of three beds, 3x16 feet each, taken up October, 1893, was 1,074 roots, weighing 73 pounds. From these I sorted out 833 roots, 20 pounds, for transplanting, again leaving 53 pounds of clean, washed roots to be dried for market, giving 17 pounds dry, which sold for \$4 per pound. It will be observed that the stock had only been decreased 241 roots; the 833 roots taken out for replanting were much larger than the roots with which the beds were originally stocked. They had been under cultivation, one bed five years, the others four years, the seed produced during that time being worth at least \$40.

I have in my garden at the present time (February, 1894) 32 beds, 3x16, stocked with roots and seeds. Also over 30,000 seeds in forest nurseries beds, and the past season's crop of seeds, about 100,000, packed in loam in condition to promote germination, ready to be sown the coming season. My plants the past season were a marvel of vigor and beauty and were the admiration of all who saw them. I had hundreds of plants with 20 and 25, and some with 30 leaves; by this I mean plants with four, five and six leaf stems

or branches, each bearing from five to seven leaflets, many of these plants standing 30 inches high and spreading 30 inches in diameter, with seed-heads from 1 to 2½ inches in diameter. I am often asked how long it will take to produce roots from seed large enough to be profitable for market. Two hundred and thirty-three seedlings of three seasons' growth taken up last October weighed 34 pounds, three or four years additional growth should give splendid results and produce roots averaging over one ounce each. The best way to get started in ginseng culture is to transplant the wild roots; in this way one soon gets to producing seed in quantity and the business can be developed quite rapidly when once fairly started. The seed is expensive and likely to remain so. It cannot be handled in bulk like other seed, and must not be allowed to get dry. They require 18 months to germinate. Ginseng can be cultivated in garden, orchard or forest. It is to be regretted that the American people are allowing this plant to become extinct in this country without making a greater effort to develop its culture. But little land or capital is required in starting this industry. One-quarter of an acre is ample for a valuable ginseng farm. One hundred dollars will do more toward developing this industry in the near future while the wild roots can be procured than \$500 will do in ten years from now. Time, with patient and persistent effort are the essential requirements. There is likely to be a demand for all that can be produced. I do not apprehend any possibility of an over-production by cultivation for many years to come. My idea, briefly stated, is this: Forest culture on an extensive scale, proper location, thorough preparation of ground, liberal fertilizing, cottage to command view of plantation, guard, then push for all it is worth; there is money in it.

PHARMACY.

TANNAL-ALUMINIUM TANNATE.—Application like that of salumini.—Riedel.
THE CENTIGRADE THERMOMETER has been adopted by Germany in place of the Reaumur, heretofore employed.

CINCHONA was introduced into Java by Dr. Hasskarl, a German-Dutch botanist, whose death was recently announced.

ZINCI-BORICUM.—Prepared by mixing solution of 5 parts zinc sulphate in 30 parts water, with solution of 4 parts borax in 100 parts of water.

CAMPHOID.—Wm. Martindale says the formula for this article should be: Camphor, 20 parts; soluble gun cotton, 1 part; absolute alcohol, 20 parts.

TINCTURE OF RHUBARB WITHOUT SAFFRON.—Two grocers in England have been fined for selling this character of preparation.

FOOD AND DRUG ADULTERATION. During 1893, in Massachusetts, 96 complaints were entered for violation of the acts relating to food and drug inspection, and 92 convictions were obtained.

SEWER AIR contains no micro-organisms which are not found in ordinary air, says Chem. & Drug., quoting Mr. Parry Lows, a bacteriologist working for the London County Council, so that if sewer air is infectious, that character must be due to something which is not vital.

NICKEL ORE has been discovered in great abundance in Germany in an old mine which has been worked for lead and zinc from time to time. It is now proposed to extract nickel from the veins.

ANTISEPTIC SANATIVE POWDER consists of 34 per cent alum and 64 per cent zinc sulphate, says Ch. & Dr. It is heralded as a new discovery of Dr. Koch, and has been introduced in the United States.

DENTAL ANAESTHETIC.—The Dental Practitioner offers this: Atropia, one-tenth grain; strophanthin, one-fifth grain; cocaine hydrochlorate, fifty grains; carbolic acid, ten grains; oil of cloves, three minims; distilled water, one ounce.

KOLA NUTS, according to a recent German patent, are to be treated with hydrogen peroxide in order to remove the bitter taste. The process is not described, hence no details of the action of the peroxide on the constituents of the drug can be given.

ADULTERATED OTTO OF ROSE will no longer be tolerated in Bulgaria, where enactments prohibiting the importation of geranium oil have recently been promulgated. Other adulterants, as cotton-seed oil, laudanum and cocculus indicus, are included in the prohibition.

BEECHNUT OIL has for some time been produced in Germany and it is now proposed to find employment for it as a table oil. The beechnut contains a little over 22 per cent of oil, which is easily extracted by pressure, and the industry promises to prove profitable.

METHYLATED TINCTURES.—An English pharmacist pleaded guilty to the charge of having on his premises tincture of opium, compound tincture of benzoin and tincture of quillaia in the preparation of which methylated spirit had been used.

GLUCOSE REACTION.—If 3 to 4 c. c. of a sugar solution are heated for one minute with 0.12 gm. iodic acid and 0.2 to 0.4 gm. sodium hydrate, the mixture cooled, acidified with dilute hydrochloric acid and cautiously covered with a layer of ammonia, a dark precipitate of iodide of nitrogen is formed.

VANILLIN is a constituent of cloves, say Jorissen & Hairs, and may be extracted from them with ether. The ether solution is then shaken with a solution of acid sodium sulphite, the latter separated, decomposed with mineral acid and agitated with ether. Evaporation of this ethereal solution leaves a white, crystalline residue of vanillin.

A TOLUOL THERMOMETER is the subject of a recent German patent, it being believed that toluol has certain advantages over both mercury and alcohol. It may be colored with aniline, is cheaper than mercury, its manufacture is less objectionable, and it possesses five times the power of expansion of mercury. It freezes at 50° C. and boils at 170° C.

DESTRUCTION OF GARBAGE.—There are now fifty-five towns and cities in England which destroy their garbage and solid refuse by burning, and 570 furnaces are employed for this purpose. In many cases the heat from these furnaces is used to produce steam, and the power is employed in pumping water and running electric light and power plants, and other purposes.

NEW REMEDIES.

CEIHERID is a glucoside obtained from *Cerbera yecothi*. It is a remedy for heart troubles.

CORONILLIN is a body found in *Coronilla scorpioides*. This is a yellow powder, soluble in water and alcohol.

DIAPHNOL is the aseptol of the quinoline series. Its use is quite similar to that of aseptol, and its chemical name is *o*-oxyquinoline-*m*-sulphonic acid.

OUABAIN is a glucoside from the bark and wood of *Acoceantha defersii*, and is now being manufactured commercially. It is a bitter yellow powder, very hygroscopic and giving fluorescent solutions.

SOLPHINOL is now described as a new antiseptic. It appears to be a mixture of borax, boracic acid and acid sulphites of the alkalis. This is scarcely worthy the name of a new remedy. (Br. and Col. Dr.)

AESCORCIN is a derivative of Aesculetin, a decomposition product of Aesculin, the glucoside of the horse chestnut. It is proposed as a remedy for diseases of the cornea. A 10 per cent solution in distilled water is prepared, and a drop or two poured into the eye.

EURYBIN is a glucoside obtained from *Eurybia moschata*, one of the Compositae of New Zealand. It is an amorphous, slightly yellow, bitter powder, soluble in water and alcohol. Neutral acetate of lead gives no precipitate with it, whilst basic acetate does so. Tannin also precipitates it. It does not reduce Fehling's solution until hydrolysed, when it yields a resin and a sugar.

MALACINE is proposed as an anti-rheumatic by A. Jaquet (Sem. Med.), who says it is well borne and has no unpleasant after effects. In chemical structure it is a salicylic derivative of phenacetine, occurring in small, pale yellow crystals, insoluble in water but dissolving in hot alcohol. It is easily decomposed by the mineral acids, even in weak solution, into phenacetine and salicylic aldehyde.

LYCETOL, the last synthetic remedy on the market is a derivative of piperazine, Bayer & Co. have prepared dimethyl-piperazine in a pure state, and have put forward the tartrate on the market under the name of Lycetol. The constitution of this body is similar to that of piperazine and may be called dipropylene-diamide, although this name is scarcely applicable to a compound of this nature. Its use will be similar to that of piperazine.

BISMUTH PHENATES.—Among a group of antiseptic combinations of bismuth, the following are more important: Phenol bismuth, cresol bismuth, tribromophenol bismuth, chlorphenol bismuth, resorcin bismuth, and betanaphthol bismuth. These form neutral, inodorous, tasteless powders of red, yellow and white colors; insoluble in water. Among these, the naphthol bismuth has found application in the treatment of the first stages of cholera, dose 2 gms. In the intestines it is split up into beta-naphthol, which is eliminated through the kidneys, and bismuth oxide. The tribromophenol bismuth is recommended as an intestinal antiseptic; forms a yellow-colored, neutral, insoluble powder, containing 50 per cent tribromophenol; said to be almost a specific against cholera bacilli. Dose, 5 to 7 gms.

THYMACETIN.—A crystalline solid; derived from thymol, in which an ethyl group is substituted for the H of hydroxyl, and an acetylated amido group for an H in the nucleus. Employed as an anti-neuralgic.

SODIUM SULFOCAFFEATE-NASHTOL.—Since the introduction of the sulpho group decreases the medicinal potency in phenol groups, the same was tried here with success. Bitter, crystalline, slightly soluble in cold water, non-toxic, does not irritate the stomach. Solutions containing more than 5 per cent are not stable. Besides above, soda, lithium and strontium salts are prepared. A powerful diuretic. Dose, 1 gm. in capsule.

THIURET.— $C_4H_7N_2S_2$ —A sulphurated antiseptic. Oxidation product of phenyl-dithioburet. Inodorous crystalline powder, insoluble in water; soluble in alcohol and ether. Has the property of giving up sulphur readily (*statu nascenti*) upon which its disinfectant properties depend. As best adapted salt of this basic thiuret, is the para-phenylsulfonate, a yellow, crystalline, inodorous powder, which can be employed in solution as well as dry antiseptic.

LYSOL is prepared from the fraction of tar oil which boils between 190° and 290° C. by dissolving it in fat and saponifying with the aid of alcohol. It is a brown, oily-looking, clear liquid, with a feebly creosote odor, and contains 50 per cent of cresols. It forms clear mixtures at once, in every proportion and at all temperatures, with water. It possesses the properties of a saponaceous solution in addition to its germicidal power. It is non-toxic, and in this respect possesses certain

DULCIN OR SUCROL.—Para-phenetol-carbamide. It is closely related to urea, in which the H in one of the amido groups is replaced by the phenetidine residue. A white crystal solid; soluble in 800 parts cold and 50 of hot water and 25 of alcohol. Because of its intense sweet taste, being 200 times that of cane sugar, offers a substitute for this carbohydrate. In large doses does not produce injurious effects; and in long continued use does not create the dislike usually caused by saccharin.

SALICYLACETOL.—The decomposition of salol in the system into salicylic acid and phenol, the toxic effects of the latter being often manifested, led to the introduction of salophen; this splits up into salicylic acid and amido-phenol. This same view led to the combination of salicylic acid with a non-poisonous body, acetone. It is made by the reaction between mono-chlor-acetone and sodium salicylate. Forms crystalline needles, sparingly soluble in water. Employed in the treatment of summer diarrhoea. Dose, 2 to 3 gms. daily.

FORMALIN.—Formic aldehyde, being a well-known powerful anti-bacterial, has led to its introduction by the Schering factory; is an aqueous 40 per cent solution. Owing to the volatility of formic aldehyde, it is given off at ordinary temperature. In dilution of 1 to 20,000, it destroys the anthrax bacillus in one hour, excelling all disinfectants and equal to sublimate; preferred to this because of its non-poisonous properties. Valuable for disinfecting instruments, sponges, sick-rooms, etc., a 1 per cent solution is best adapted. Employed in the form of dry powder, containing 20 per cent; the absorbent material being infusorial earth.

FORMULARY
AND
QUESTION BOX.

The object of this department is to furnish our subscribers with reliable and tried formulae and to discuss questions relating to practical pharmacy, prescription work, dispensing difficulties, etc.

Requests for information are not acknowledged by mail and ANONYMOUS COMMUNICATIONS RECEIVE NO ATTENTION. To insure answer in the next number, queries should be in our hands *ten days* prior to the date of issue.

1126. Syrup Hydrulic Acid, a Correction.

Mr. M. H. Koons, Allentown, Pa., calls our attention to a typographical error in the formula under the above title given in the May 1, 1893, Era, page 397. As it reads the sodium hypophosphite and potassium iodide are directed to be dissolved in 62 drams of water. It should read 6 drams, instead of 62 drams.

6024. Emulsion Cod Liver Oil With Hypophosphites.

(A. K.) See reply to query 5995, January 15, 1894, Era, page 61.

6025. Aphrodisiac Formulae.

(C. & H.) We cannot answer queries of this character and would advise you to consult a reputable physician.

6026. Ohio Board of Pharmacy.

(W. M. H.) The Ohio Board of Pharmacy does not send us a list of those who successfully pass its examinations. Write the secretary. He will perhaps be willing to furnish you the information.

6027. Best Solvent for Papoid.

(N. Y. C. P.) Papoid is a trade-marked preparation, and we would suggest that you write the manufacturers, who will doubtless be glad to furnish you information regarding its solubility in different solvents, and the best method for its administration. It is probably soluble in either water or glycerine, or both, as most of the mixtures we have seen prescribed contain one or both of these solvents.

6028. Perfume Extract.

(W. H. F.) A most careful search fails to reveal a formula for the odor you name. Farther, the name, we believe, is trade-marked, which would of course prevent you or anyone else using it as a title for a similar article. As to duplicating the odor, we can do nothing other than to suggest that you make a few experiments calling into requisition your sense of smell, a most important factor in the determination and simulation of any particular perfume.

6029. Tar Marking Ink.

(Subscriber.) Dilute 30 parts of coal tar with the same volume of benzine, and rub in thoroughly 3 parts of ivory black and 1 part of Prussian blue. The consistency may be varied by adding more or less benzine. This ink is intended to be used with a hand stamp and is the only "tar ink" with which we are familiar.

6030. Elixir of Pyrophosphate of Iron, Quinine and Strychnine.

(A. R.) asks whether a reaction takes place in preparing the above elixir with citric acid and ammonia. What salt is found in the finished elixir? If our correspondent will kindly furnish the pro-

cess or formula he uses in manufacturing this elixir, we will endeavor to answer him. As it now stands his query is rather obscurely stated.

6031. Crystallization of Sugar in Syrup of Tolu.

(N. Y. C. P.) asks what causes crystallization of sugar in syrup of tolu made after the formula given in the U. S. P. of 1890. We think his trouble arises from a supersaturation of the aqueous solution of tolu with sugar. We cannot account for it in any other way, unless it be that he has allowed some or all of the alcohol in which he dissolved the balsam of tolu, to remain. If this be the case, then the quantity of sugar must be reduced, as water mixed with alcohol will not dissolve as much sugar as will water alone. If the alcohol be allowed to remain, the quantity of sugar in the official formula should be reduced from 850 to 800 grams.

6032. Tincture of Orange in Wine, Beef and Iron.

(J. W. H.) asks which he shall use in the preparation of Wine, Beef and Iron, the tincture of bitter orange or the tincture of sweet orange. He uses formula No. 233, Era Formulary, which does not specify. The difference in the finished product would be very trifling indeed, whichever of the tinctures be used. It may be left entirely to the taste and judgment of the operator. The majority of pharmacists probably prefer the tincture of sweet orange peel, as that is made from the rind of fresh oranges, contains a larger proportion of the volatile oil, and has a more agreeable flavor than that made from the dry rind of the bitter orange.

6033. Prescription Query.

(G. E.) asks how to compound the following:

- R
Zinc oxide 2 drams.
Zinc carbonate, precipitated 1 dram.
Petrolatum ½ ounce.
Solution of lime, enough to make 4 ounces.

- R
Carbolic acid 2 fl. drams.
Extract opium 2 drams.
Olive oil ½ pint.

We would like to hear from our readers.

6034. Pile Ointment.

- (J. M.)
(1.) Powdered opium..... 20 grains.
Extract belladonna 10 grains.
Cold cream 1 ounce.
(2.) Powdered galls..... 2 drams.
Powdered opium 30 grains.
Purified lard 1 ounce.
(3.) Tannin 20 grains.
Cocaine hydrochlorate..... 20 grains.
Morphine sulphate 5 grains.
Atropine sulphate 4 grains.
Petrolatum, soft 1 ounce.
Perfume with otto of rose.

6035. Vegetable Compound.

(J. R. W.) It is said that this preparation closely resembles an infusion or decoction of gnapthaliu polycephalum or life everlasting. An exchange is authority for the following widely differing formula:

- Cramp bark..... 1 pound.
Partridge berry vln..... 1 pound.
Poplar bark..... ½ pound.

- Unicorn root ½ pound.
Cassia ½ pound.
Beth root..... 6 ounces.
Sugar 6 pounds.
Alcohol ½ gallon.
Water, a sufficient quantity.

Reduce the first six ingredients to No. 40 powder, add boiling water enough to cover, let stand till cold, and then percolate with water until 2½ gallons of liquid are obtained. To this add the sugar, bring to a boil, remove from the fire, and, when cold, add the alcohol.

6036. Hair Tonic.

- (G. F. L.) Try the following:
Cologne 2 fl. ounces.
Quinine sulphate..... 15 grains.
Tincture cantharides..... 3 fl. drams.
Borax 1 dram.
Ammonia water..... 1 fl. dram.
Glycerine 3 fl. ounces.
Tincture cudbear enough to color.
Alcohol 6 fl. ounces.
Water enough to make. 16 fl. ounces.
(2.) Powdered borax..... 2 drams.
Tincture cantharides..... ½ fl. ounce.
Ammonia water..... 1 fl. dram.
Cologne 1 fl. ounce.
Glycerine 2 fl. ounces.
Alcohol 3 fl. ounces.
Sage infusion enough to make 16 fl. ounces.

6037. Mixture of Chloral and Potassium Bromide.

(N. Y. C. P.) See reply to query No. 917 in the December 15, 1892, Era, page 366. Besides referring you to the Compound Mixture of Chloral and Potassium Bromide of the National Formulary, which, by the way, is the best formula we know of, the following, sometimes dispensed under the above title, are quoted:

- (1.)
Potassium bromide..... 4 drams.
Chloral hydrate..... 4 drams.
Extract cannabis Indica. 16 grains.
Extract henbane..... 16 grains.
Glycerine 2 ounces.
Oil neroli..... 10 drops.
Alcohol 1 fl. dram.
Caramel, sufficient.
Distilled water enough to make 1 pint.

(2.) This one is taken from the Pharmacopoeia of the Edinburgh Royal Infirmary:

- Potassium bromide..... 6 drams.
Chloral hydrate..... 6 drams.
Tincture of hyoscyamus. 3 drams.
Tincture of cannabis Indica 1½ drams.
Lemon syrup..... 3 ounces.
Distilled water, up to..... 6 ounces.

6038. Resorcin and Ammonium Carbonate, in a Prescription.

(A. S. G.) asks the cause of the color change in this prescription:
Ammonium carbonate..... 1 dram.
Resorcin 2 drams.
Cherry laurel water, enough to make..... 3 ounces.

He says he dispensed the prescription as a clear, colorless solution; six hours afterward it was brought back, having turned a beautiful dark blue color. Experimenting, he found that the mixture soon began to assume a greenish tinge, finally changing to a blue color. The color change observed is due to the action of ammonium carbonate upon resorcin. The combination of resorcin with various reagents produces characteristic

color changes by which its identity may be established. Thus, if to a solution of resorcin be added a few drops of ferric chloride, the liquid assumes a bluish-violet color. On heating resorcin with tartaric and sulphuric acids, a thick carmine liquid is formed which becomes pale yellow when diluted with water. Chlorinated lime colors its solutions violet, while, as you have observed, its solution in ammonia when exposed to the air, goes through the various changes of color from rose red and brown to green and blue. See also other reactions for resorcin given in the Pharmacopoeia.

6039. Acetic Ether and Oil of Lemon Balm in Extract of Lemon.

(J. S.) To what extent acetic ether is used in the manufacture of this particular flavoring extract we cannot say. We do know, however, that it is directed to be added, and is one of the ingredients of many so-called artificial flavoring extracts. It possesses a fruity, ethereal and agreeable odor, and is used for the purpose of imparting this characteristic to the extract. The true oil of lemon balm or oil of melissa, owing to the very small yield, is very expensive and is therefore not used in flavoring extracts. The only use to which it is put is for the preparation of some perfumes which owe their peculiar qualities to its strong odor. This oil, according to Askinson, is sometimes confounded with the spurious oil of melissa, variously known in the trade under the names of lemon grass oil, Indian verbena oil, or Indian melissa oil, or simply oil of verbena or oil of melissa. Constructing a formula upon the lines you suggest, using oil of lemon grass, we append the following:

- Oil of lemon..... 3 fl. ounces.
Oil of lemon grass, fresh 1 fl. dram.
Lemon peel (fresh grated) from 12 lemons.
Acetic ether..... ¼ fl. ounce.
Alcohol 7 pints.
Water 1 pint.

Mix and macerate for seven days. See also various other formulas in the Era Formulary, page 397.

6040. Paste Mucilage.

(W. P. C.) Try one of the following:

- (1.)
Flour paste..... 100 parts.
Alum water..... 3 parts.
Solution of dextrine..... 5 parts.

- (2.)
Rye flour..... 4 ounces.
Powdered alum..... ½ ounce.
Rub to a smooth paste with 8 ounces of cold water, strain through a cheese cloth and pour into 1 pint of boiling water. Continue heat until thickened to suit. When nearly cold add—

- Glycerine 1 ounce.
Oil of cloves..... 30 drops.

(3.) Rice Paste may be prepared by mixing rice flour and water, which is then heated to the boiling point until the required consistency is obtained. This paste possesses great adhesive power and is recommended where it is desired that the object to be pasted on or together should undergo no change in color or shading. Glycerine and oil of cloves may be added to preserve the paste.

6041. Acetic Acid in the Preparation of Extracts.

(C. M. G.) The National Dispensatory says that for some time past experiments have been going on in the hands of manu-

facturers and others with a view of introducing acetic acid, in place of alcoholic and hydroalcoholic menstrua, in the preparation of fluid and solid extracts. Results thus far published indicate that 99 per cent acetic acid is admirably suited for the exhaustion of certain drugs, particularly those owing their virtue to alkaloidal, aromatic and even resinous principles, less menstruum, as a rule, being required also for complete exhaustion. The fact, however, that acetic acid menstruum has been found to cause an increase in the percentage of extractive rather shows that, in some instances at least, an increased amount of inert matter is dissolved by the more aqueous menstruum, since practically no increase in percentage of alkaloid or active resinous matter has been observed. This would appear to be a drawback to the use of acid aqueous menstruum; besides which the presence of a considerable quantity of acetic acid in the finished fluid extracts might be objected to by physicians from a therapeutical standpoint. In a few cases, notably of alkaloidal and oleoresinous as well as purely aromatic drugs, superior preparations have been obtained with acetic acid menstruum, and the finished fluid extracts possessed a finer aroma than those made with the official menstruum. The U. S. Pharmacopoeia has recognized the value of acetic acid as a solvent in the manufacture of fluid extracts by directing its use, at least in part, in the case of nux vomica and sanguinaria; no doubt continued favorable results will cause the displacement of alcohol by acetic acid for a larger number of drugs.

6002. Elixir Cascara Sacrada Aromatic.

(F. A. B.) The following is taken from the Era Formulary:

Fluid extract cascara.....	4 fl. ounces.
Syrup wild cherry.....	2 fl. ounces.
Syrup.....	6 fl. ounces.
Oil cloves.....	6 minims.
Oil cassia.....	6 minims.
Oil lemon.....	20 minims.
Oil orange.....	20 minims.
Oil nutmeg.....	4 minims.
Oil fennel.....	12 minims.
Alcohol.....	2½ fl. ounces.
Fuller's earth.....	½ ounce.
Water.....	2 fl. ounces.

Mix and filter, pouring water through the filter to make 1 pint.

(2.) Make an aromatic fluid extract after the following formula:

Cascara sagrada (No. 40 powder).....	100 parts.
Calcined magnesia.....	1 part.
Alcohol.....	100 parts.
Water, quantity sufficient.	

Mix the alcohol with the water in the proportion of 2 to 3 of water; moisten the mixed powders thoroughly with the menstruum, and let stand until the bitterness disappears; then pack in a percolator and percolate, adding more water, if necessary, until 200 parts extract is obtained. To every fourteen ounces of the percolate thus obtained, add

Spirit cinnamon.....	½ dram.
Spirit nutmeg.....	15 minims.
Fluid extract licorice.....	1 ounce.
Glycerine.....	1 ounce.

Of this fluid extract, take four liquid ounces and add sufficient aromatic elixir to measure 1 pint.

6003. Doses of Atropine Sulphate, Strychnine Sulphate and Tincture of Cannabis Indica.

(H. H. M. D.) asks the maximum doses of these drugs that can be administered repeatedly, two hours apart, to an adult of intemperate habits. We are not informed whether they are to be given in combination or singly. Indeed, it would make but little difference in our reply, as it is a question for the physician, and he could only determine by knowing the personal characteristics and idiosyncrasies of his patient. No two patients are constituted alike and the dosage ought to be able to stand another might not endure. In a general way, the dose of atropine sulphate for internal administration is stated to be 1-20 to 1-60 of a grain, with a maximum of 1-20 grain per day. Subcutaneously it may be administered in doses of 1-300 to 1-125 of a grain. Strychnine nitrate, largely used in the treatment of dipsomania and alcoholism at the present, is given both internally and subcutaneously in doses of 1-60 grain up to the maximum of 1-6 or 1-3 grain per day. For long administration it is given in initial doses of 1-60 grain and increased each day until a dose of 1-6 grain is reached, in which amount it is to be given for 5 or 6 days, and then stopped for 10 or 12 days. In cases of delirium tremens, it is said that it may be used hypodermatically almost to the commencement of tetanic action. Cannabis Indica is generally considered antagonistic to strychnine, though it is frequently prescribed with nux vomica to modify the action of the latter. Tincture of cannabis indica is given in doses of from 10 to 30 minims, its physiological effects, however, being very uncertain. Your query may be farther answered by the general statement that in all cases, in which any of the drugs named are used, either singly or in combination, a careful practitioner will take into consideration the modifying operation of idiosyncrasies, and the conditions of the disease under treatment.

6004. Caking of Powdered Extracts.

(A. K.) asks how powdered extracts that have become hardened into a mass can be removed from the bottle, and if such hardening impairs the medicinal qualities. As to removing the extract from the bottle, there is no other way that can be suggested than for you to break the bottle. "Caking" of a powdered extract is by no means an uncommon thing. Just to what extent it may impair the quality of the extract depends largely upon the character of the drug from which the extract is made. All powdered extracts are not by any means the best representatives of the therapeutic value of drugs. Thus, black haw, conium seed, eucalyptus and valerian owe their virtues partly to liquid volatile products that are dissipated during the evaporating process, which necessarily modifies, to a certain extent, the therapeutic value of the powdered extracts. Again, some drugs contain resins, cannabis indica, for instance, which are semi-solid in their nature and they cannot be reduced to the condition of a solid without chemical alteration. Various diluents have been used for drying and preserving extracts. Sugar of milk, powdered licorice, dextrin, admixture of the powdered drug, etc.

It is very difficult to say just how much caking impairs the therapeutic value of

any powdered extract. It all depends upon the character of the extract. The absorption of moisture, if nothing else necessarily increases the weight of the extract and would seem to imply a readjustment of the dose.

6005. Peach and Pear Flavoring Extracts.

(Subscriber.) The so-called peach extract used for flavoring is generally a bitter almond extract, representing the oil of the peach kernels, rather than that of the edible portion. Here is a formula taken from the Era Formulary:

(1.)	
Bruised peach pits.....	4 drams.
Oil bitter almonds.....	2 drams.
Diluted alcohol.....	16 ounces.
Macerate 48 hours and filter.	
Here is a formula in which artificial ethers are combined with peach juice:	
(2.)	
Oenanthic ether.....	4 fl. drams.
Acetic ether.....	4 fl. drams.
Butyric acid of amyl.....	2 fl. drams.
Valerianic ether.....	2 fl. drams.
Oil bitter almonds.....	20 minims.
Peach juice.....	4 fl. ounces.
Glycerine.....	2 fl. ounces.
Cologne spirit.....	9 fl. ounces.

Mix and filter.

Dubelle gives this one:

(3.)	
Deodorized alcohol.....	50 fl. ounces.
Pure peach juice.....	20 fl. ounces.
Acetic ether.....	5 fl. ounces.
Formic ether.....	5 fl. ounces.
Butyric ether.....	5 fl. ounces.
Valerianic ether.....	5 fl. ounces.
Oil bitter almond.....	5 fl. ounces.
Aldehyde.....	2 fl. ounces.
Amyl alcohol.....	2 fl. ounces.
Glycerine.....	1 fl. ounce.

Flavoring Extract of Pear.

(1.)	
Deodorized alcohol.....	60 fl. ounces.
Pure pear juice.....	20 fl. ounces.
Acetate of amyl.....	10 fl. ounces.
Acetic ether.....	5 fl. ounces.
Glycerine.....	5 fl. ounces.

Deite gives this one:

(2.)	
Acetic ether.....	50 cubic centimeters.
Acetic amyl ether.....	100 cubic centimeters.
Glycerine.....	100 cubic centimeters.
Alcohol, 90 per cent, enough to make 1 liter.	

6006. Furniture Polish.

(G. G. S.)

(1.) Dissolve 4 ounces of orange shellac in 2 pints of alcohol of 95°. This will take from 24 to 36 hours, if the liquid is kept in a warm place and frequently shaken. Add 1 pint of oil of turpentine, and shake well. This will probably take up any residue of undissolved shellac. Add 2 pints of hotted linseed oil, and mix well by agitation. When thoroughly mixed, add 4 ounces sulphuric ether and an equal amount of strongest water of ammonia, and agitate. Shake the bottle before using. It should be applied with a sponge, and very lightly. The furniture should, of course, be washed and thoroughly dried before its use.

(2.)	
Yellow wax.....	1 pound.
Yellow soap.....	2 ounces.
Oil turpentine.....	2 pints.
Boiling water.....	2 pints.
Melt the soap and wax over a slow fire.	

add the turpentine, and lastly stir in the water until quite cold.

Here are three formulas for Polishing Pastes:

(1.)

One ounce beeswax, $\frac{1}{4}$ ounce white wax, 1 ounce Castile soap, 1 pint boiling water, $\frac{1}{2}$ pint turpentine, $\frac{1}{2}$ pint spirits of wine. Shred the wax and soap very thin; pour the boiling water upon the shavings and let it become cold; then pour on the turpentine and spirits of wine. Put a little on a cloth, rub it into the furniture, and then rub to a polished surface with a woolen cloth.

(2.)

One ounce pearlsh, 8 ounces genuine beeswax, 8 ounces water. Put all the ingredients into an earthenware jar, and warm the mixture so that it becomes semi-fluid; then add sufficient water to bring it to the consistency of cream. Reduce the consistency by adding more water, and then spread it on the wood with a painter's brush; let it dry, and then polish with a hard brush or cloth.

(3.)

Two quarts soft water, 2 ounces soap, 8 ounces white wax in shavings, 1 ounce pearlsh. Boil the ingredients, except the pearlsh, which is added after; then dilute the compound with water. Put the composition on the furniture with a paint brush, and polish off with a cloth or hard brush.

6047. Cleaning Carpets, Dry Method.

(C. C. F.) All carpets intended for dry cleaning must first be well swept or brushed with a hard broom. Have ready a number of dry coarse cotton or linen cloths, some coarse flannels, and one or more large pieces of coarse sponge; two or more hard scrubbing or scouring brushes, some large tubs or pans, and pails, and also a plentiful supply of both hot and cold water. First take out all of the grease spots; this may be effected in several ways: well rub the spot with a piece of hard soap, and wash out with a brush and cold water, and dry each spot before leaving it; or use instead of the soap, a mixture of fuller's earth, gall, and water, well rinsing and drying each spot as before. When this has been done the carpet may be cleaned by one of these methods: Cut up a bar of soap and dissolve it over a fire in two gallons of water. Put two quarts of this dissolved soap into a pail of warm water. Dip a scrubbing brush into this soap solution, and scour with it about one square yard of the carpet; be careful not to let the solution soak through the carpet. When this piece is thoroughly cleaned, rub the soap well out of it by means of a coarse flannel or sponge, sucking up all the wet and dirt made by the brush; rinse the flannel or sponge frequently in warm water. Have ready a pail of clean cold water, to which has been added enough sulphuric acid or sharp vinegar to make it taste sour. Take a clean sponge and dip into the sour solution, squeeze it out, and then rub into the part just cleaned and rinsed. Rub as dry as possible with clean, coarse cotton or linen cloths before proceeding with the cleaning. The whole carpet is to be cleaned and dried in the same manner, a square yard at a time.

To Clean with Gall—Put a bag of very fresh bullock's gall into a pail containing two gallons cold water, with four ounces of pearlsh dissolved in it, and well mix

by using a stick. Have ready, besides the above, two pails cold water, a large sponge, a couple of flannels, and some dry coarse cloths. Dip the brush into the gall and water, and scrub the carpet as quickly and as carefully as possible. Rinse, and suck up the gall and dirt with a large flannel or sponge, which is to be frequently rinsed in the pails of cold water. Dry with cloths before beginning a second square.

In dry cleaning, special care must be taken not to allow the liquor to soak to the back of the carpet. A good fire should also be kept in the room during the whole time, as much of the success of the operation depends on rapid drying.

6048. Books to Read up on Pharmacy.

(K. T.)—Your query, in one form or another, has been frequently answered in these columns. A list of the books necessary to prepare one to pass the Tennessee Board of Pharmacy examination is no different from the list of books required to post one for an examination by any other state board of pharmacy. The best methods of posting yourself cannot be decided by us. It remains for you to choose books and processes. If you wish to gain a thorough knowledge of pharmacy and one which would fit you to pass the Tennessee or any other board of pharmacy, the study must be undertaken systematically and in earnest. Systematic study is best accomplished in a college of pharmacy, but if it be impossible for you to undertake such a course, then we can offer no better advice than for you to follow this tabulated course of reading and plan of study, prepared by Dr. A. B. Prescott:

1. General Chemistry; First Principles; Attfield (first 128 pages), or Shepard.
 2. Study of Inorganic Chemicals in the Store—referring to the U. S. P.
 3. Operative Pharmacy; Remington's Part I.
 4. Botany; Gray.
 5. Organic Chemistry; Attfield, or Remsen.
 6. Practice in the conversion of weights, volumes, and chemical proportions. Reference reading.
 7. Study of the Crude Drugs of the store, their constituents and products. Doses. Reference Reading.
 8. The poisonous effects of medicines. Doses.
 9. Extemporaneous Pharmacy; Prescription Difficulties; Language of Prescriptions, and practice in their interpretation. (Remington's, Part V; Gerrish on Latinity. Reference Reading.)
 10. General Pharmacognosy and Pharmacy. A study of the Drugs, Preparations, and Operations of the store. Reading by Reference to the Books already named, the dispensatories, etc. Reference Reading of the Periodical Literature.
- About two years ago we ascertained the ideas of many leading pharmacists regarding the books indispensable in the drug store. The following is a typical list:
- U. S. Pharmacopoeia.
 - A Dispensatory.
 - National Formulary.
 - Era Formulary.
 - German Pharmacopoeia.
 - British Pharmacopoeia, or Squire's Companion.
 - Attfield's or Fowne's Chemistry.
 - Latin Dictionary.
 - Era Dose Book and Reference Tables.

Reference works advised are:

Malsch's Materia Medica.
Pharmacographia.
Watt's Dictionary of Chemistry.
A work on Urinalysis, Hoffmann's is good.
King's Dispensary, by Lloyd.
Remington's Pharmacy.
The Pharmaceutical Era.
Another live pharmaceutical journal of national importance.
If there is a local journal devoted to pharmacy you want that.

Gray's Botany.

A Medical Lexicon, Thomas' is good.

Read also remarks in Era, October 1, 1891, p. 267. Oldberg's "Course of Home Study in Pharmacy" is a system, and an excellent one, too, of imparting instruction and receiving replies through correspondence, in conjunction with systematic study of the text book advised.

Any or all of these books may be obtained from this office. For prices see advertising pages of this journal.

Formulas Wanted.

(A. S. C.) Thymoline.
(J. B. P.) Sans Mal. & Barr's Painless Extractor.
(Subscriber.) Delaware Peach Wine.

FRUIT JUICES BY DIFFUSION.—The diffusion process, which has been successfully used in sugar manufacture, is now being employed for the extraction of fruit juices. In manipulating apples in the process of cider making a great deal of albuminous matter is extracted. In the diffusion process the juice is washed out from the sliced fruit with cold water. The water passes from one compartment filled with fruit, to another, meeting in each division fresher fruit than in the preceding one, so that at the completion of the process it is saturated with juice, or more strictly speaking, it changes places with the juice, which issues nearly pure from the machine.

NICOTINE IN TOBACCO, says G. B. De Toni, is located chiefly in the epidermal tissues, being absent from the seed and young plant. The alkaloid does not appear to exercise any protective influence on the tobacco plant, since both the fresh and the dried leaves are devoured by many insects. Its function is believed to be simply excretory, and the alkaloid itself is a product of the reduction of oxygenous substances. The best chemical tests for nicotine are said to be double iodide of potassium and mercury; iodized iodide of potassium; tannic acid; tetrachloride of platinum; iodized iodic acid; Dragendorff's reagent; trichloride of gold.

VARIABILITY OF PATENT MEDICINES.—In recent cases of prosecution in Great Britain evidence of chemical analysts was brought to the effect that in a certain secret article the amount of morphine contained varied in the bottles examined from 1-10 of a grain to $\frac{1}{4}$ grain and 4-10 of a grain to the fluid ounce. This goes to show that the boast of some patent medicine manufacturers that their methods are reliable and produce uniform results, and that because of the magnitude of their operations they are better equipped for manufacturing remedies, is not carried out in experience and affords a warning against improper use of secret articles containing potent ingredients.

EXAMINATION QUESTIONS.

This department is for the publication of questions and answers from our readers, the object being to place before them questions for self-examination and to indicate the directions in which study can be profitably carried on.

We solicit questions to which replies are desired, particularly questions suggested by personal experience and study.

Correct answers to the questions in each series will be published in a subsequent issue of the paper, as announced, together with the names of all persons sending us correct replies.

Write the number of the series at the top of your reply and write on one side of sheet only.

Address—EDITOR PHARMACEUTICAL ERA,
Box 588, Detroit, Mich.

SERIES NO. 1.

Correct answers to these questions, together with the names of all persons answering correctly eight or more of them, will be published in our April 1st issue. Replies should reach us not later than March 15th, 1894.

1. Give meaning of the term evaporate, and state the difference between evaporation and distillation.
2. What is the difference between a sediment and a precipitate.
3. Give the official fluid or liquid measures, their abbreviations, and their equivalents in minims. (By "official" is understood U. S. P.)
4. What is the official thermometer? Why is mercury especially adapted for use in thermometers? Convert—10° R. into degrees temperature official standard.

5. Write a prescription for a four-ounce emulsion containing 25 per cent of castor oil. Give all the ingredients to make an agreeable and homogeneous mixture, with directions for compounding.

6. What significance is attached to the terminations ate and ite in the nomenclature of salts?

7. Define fermentation. What is a ferment? Give examples (pharmacopoeial) of the products of fermentation.

8. How would you distinguish between morphine and quinine? Between corrosive sublimate and calomel?

9. Two ounces of distilled water at 15° C. will dissolve how many grains of each of the following? Potassium chlorate? Boric acid? Epsom salt?

10. State the difference between annual, biennial and perennial plants, and give an example of each.

SERIES NO. 2.

Correct answers to these questions, together with the names of all persons answering correctly eight or more of them, will be published in our April 15th issue. Replies should reach us not later than April 1st, 1894.

1. In the nomenclature of the Pharmacopoeia how are the titles of substances expressed?

2. What is effervescence? Deliquescent? Name two pharmacopoeial salts which effloresce. Two which are deliquescent.

3. Outline the official process for making syrup of wild cherry. Why is this process used? Upon what constituent does the virtue of this preparation depend? Why is glycerine used in the preparation?

4. Give the official title and the common and maximum doses of Kermes mineral, mercuric chloride, African pepper, tincture of opium, tincture of digitalis, tinc-

ture cantharides. Which are toxic, and what are the antidotes?

5. Belladonna. Give the botanical name. Common name. Country indigenous to. What part is used? When should it be collected? What is the active principle? What is the dose of the powdered leaves? Of the principal alkaloid? Name antidote for belladonna poisoning. Name the official preparations of belladonna.

6. What do you understand by a poison? An antidote? A dose?

7. Write correctly in Latin, without abbreviation, and state the quantities of each ingredient, a formula to make one pint of an elixir, of which each fluid dram is to contain 1 grain of quinine, 100 grain strychnine, and 2 grains phosphate of iron.

8. Write an equation showing the reaction which occurs in the preparation of syrup lodide of iron by the official process. Spirit Mindererus, Hydrated Alumina.

9. What is the difference between a hydrocarbon and a carbohydrate? Give an example of each.

10. What is an essential oil? Name several official ones, and state their properties and dose. How would you detect the addition of alcohol to an essential oil?

SERIES NO. 3.

Correct answers to these questions, together with the names of all persons answering correctly eight or more of them, will be published in our May 1st issue. Replies should reach us not later than April 15th, 1894.

1. In what proportion must two quantities of powdered opium, containing 13.5 and 16 per cent of morphine respectively be mixed to produce 8 ounces of opium containing 14 per cent of morphine?

2. A quantity of official sulphuric acid weighs 15 grams. How many cubic centimeters does it measure? A quantity of official nitric acid measures 25 cubic centimeters. How much does it weigh in grams? In grains?

3. How would you distinguish between a root and an underground stem?

4. Which contains the larger percentage of alcohol; a solution made from equal parts by weight of alcohol and water, or one made from equal parts by measure of alcohol and water?

5. What is the percentage of bromine and how many grains of bromine are there in one ounce of potassium bromide?

6. What is an alum, chemically considered? Write the chemical symbols for two alums not containing aluminum. Name the pharmacopoeial and other varieties of alum.

7. Complete the following chemical equations:

8. What is meant by the following prefixes used in the nomenclature of salts: Mono, bi, tri, quadri, di, bis, ter, tetra, super, hyper, per, sesqui, sub, hypo, proto, ortho, meta, pyro, para.

9. What are the chemical differences between red and yellow oxides of mercury? Give the chemical formula for each.

10. Which contains the more quinine (alkaloid), quinine bisulphate or quinine sulphate? Give the percentage of quinine in each salt and exhibit the figures used in your calculations.

SERIES NO. 4.

Correct answers to these questions together with the names of all persons answering correctly eight or more of them, will be published in our May 15th issue. Replies should reach us not later than May 1st, 1894.

1) How would you distinguish between carbolic acid and creosote?

2) What is a symbol, and what does a chemical formula represent?

3) How would you prove that the specific gravity of iron is 7.50?

4) Name the pharmacopoeia directs shall consist wholly of stigmata?

4) How would you distinguish between gallic and tannic acids?

5) Name the best excipient for a pill mass with each of the following: An essential oil, potassium permanganate, balsam copaiba, silver nitrate, corrosive sublimate.

6) How would you dispense the following prescription?

Ferrous sulphate, ʒj grains.

Potassium carbonate, ʒss grains.

Mix, and divide into 24 pills.

7) How many one-eighth grain doses should there be in one-eighth ounce bottle morphine sulphate as found in the market?

8) What is an alcohol chemically considered? Name those covered by your definition that are official in the United States Pharmacopoeia.

9) How would you prove the air to be a mixture and not a chemical compound?

10) What is the difference between benzoin and benzol?

CHLOROFORM.—D. E. Dott, in a paper read before the North British Branch of the Pharmaceutical Society, suggested a modification of the official tests for chloroform, proposing the following description: A dense liquid, of characteristic odor; specific gravity 1.490 to 1.465. On allowing it to evaporate from a clean surface no foreign odor should be perceptible at any stage of the evaporation. When 1 fluid dram be agitated with an equal volume of solution of silver nitrate, no precipitate or turbidity should be produced after standing for five minutes. On shaking up the chloroform with one-half its volume of distilled water, it should not redden litmus paper. When shaken with an equal volume of sulphuric acid, little or no color should be imparted to the acid.

DEATHS FROM CONSUMPTION.—The discovery of the true cause and nature of tuberculosis has made necessary a general reconstruction of statistics of mortality. Text books formerly stated that tuberculosis, meaning particularly pulmonary consumption, affected most often persons between the ages of fifteen and thirty. But tubercular infection is now known to be most frequent as a cause of death in infancy. Then it is that the mesenteric and other lymph glands and the meninges are involved; in childhood the bones are prone to be attacked, in adult life the lungs. The mortality rate per 10,000 living persons is much the greatest during the first two years of life (2.5 per cent). It rapidly falls until, between the ages of six and fifteen it scarcely exists (0.15 per cent). It then steadily rises until the decades thirty-one to forty, forty-one to fifty, and fifty-one to sixty, where it remains at about 0.6 per cent, and then falls again. Males are more subject than females, in the proportion of 90 to 781.

NEWS COMMENT.

Druggists of Springfield, Mass., will sell goods at uniform prices.

Ozokerite has been found in the Green River country in Utah.

Martin's Ferry, O., druggists will discontinue the use of telephones.

Druggist M. S. Aisbitt, Oakland, Pa., burned out on February 28.

Opium "cookers" in Victoria want the high tariff on prepared opium retained.

C. S. Morse is now city salesman for the Lamar & Rankin Drug Co., Atlanta.

Annual meeting of the Interstate League in May. Place not yet selected.

Miles C. Comstock, prominent wholesale druggist and grocer of Utica, N. Y., is dead.

Dr. W. H. Nicholson, Louisburg, N. C., has sold his business to W. G. Thomas, of the same town.

A Peoria, Ill., druggist sold 750 vaccination points in one day. He has been averaging 25 a day.

O. M. Brooks, popular young druggist of Sedalia, Mo., was married February 21 to Miss Lillie E. Ray.

T. F. Meyer, of Meyer Bros. Drug Co. St. Louis, is rusticiating at Beaver, Utah, in the interests of his health.

J. H. Woodcock, Asheville, N. C., has sold his stock and fixtures to J. T. Ames, who will continue the business.

Kansas City druggists are agitating for lower telephone rates, and the St. Paul fraternity want the same.

A bill has been introduced before the Virginia legislature to incorporate the State Pharmaceutical Association.

Sommer, Lynds & Co., recently burnt out at Quincy, Ill., will resume business as soon as their building can be put in shape.

L. G. Matthaer, Martinsburg, W. Va., has bought out the firm of E. C. Williams & Co., and will continue the business at the old stand.

Minnesota board of pharmacy charges T. W. Esterly and C. W. Lasher, druggists, of Minneapolis, with employing unregistered dispensers.

The Sommer-Lynds Co., Quincy, Ill., recently burnt out, gets \$68,000 insurance. The damaged stock was sold to a salvage company for \$49,000.

The stock of Crouch & Watson, Rome, Ga., has been purchased by Trevitt & Johnson, of the same city, who will continue the business as heretofore.

E. R. Leonard and H. L. Mitchell, for some time drug clerks at Rockland, Me., will open a drug store at Bath under the firm name of Leonard & Mitchell.

F. S. Coburn, for twelve years manager of the branch store of T. W. Dalton & Co., Syracuse, N. Y., is now prescriptionist at the James street store.

An explosion on the premises of Lewis-Bailey Drug Co., Shreveport, La., March 3, started a fire which totally destroyed the building. Loss, \$125,000; insurance, \$75,000.

An Allegheny mother gave her infant chloral by mistake for a remedy for some childish ailment. Bottles just alike, child died; druggist not blamed; simple accident.

The quarterly statement of the South Carolina Dispensary shows the profits for the past quarter to be \$67,139. The last quarter, \$32,198.16, making the total net proceeds for the six months, \$99,337.16.

The Bolton Drug Co., of Brooklyn, N. Y., is defendant in a \$5,000 damage suit brought by a woman who claims to have been injured by the bursting of a bottle of peroxide of hydrogen she had purchased at the drug store and was carrying home.

Three men have been arrested at Johnstown, Pa., for selling a medicine as Hood's Sarsaparilla, for 25 cents, the charge being conspiracy and obtaining money under false pretenses. There was no cutting in the town until these men commenced operations.

Reifert & Kimmey, Syracuse, N. Y., have purchased the drug store corner of Clinton and Fayette streets, formerly owned by T. W. Dalton & Co. Mr. Kimmey has been employed in the store for eight years as prescription clerk and Mr. Reifert comes from Rome, N. Y., where he was at one time a member of the firm of Graves & Reifert.

The Allen Drug Co., Geneva, N. Y., will open what they consider the finest drug store in the state. Mr. Allen was ten years in the drug business in Malone, N. Y.; then sold to Shillinglaw & McNulty. Mr. Allen says he never sold liquors and does not intend to, even on prescriptions. Fixtures by Bangs; fountain from Tufts.

A strange story has developed at Stockton, Cal., it being occasioned by a recent elopement of a young drug clerk with a handsome young lady acquaintance of the city. It transpires that the eloping couple are brother and sister. Their parents having died when they were small children, the girl was adopted by a gentleman of Stockton, Cal., while the boy was adopted by a family of a different name in the east. As he grew up he learned the drug business and not many years ago came to California, located at Stockton, and formed the acquaintance of his sister in the usual course of social intercourse. An attachment resulting, the parties eloped to be married before the adopted father of the girl realized the situation, and he is the only person living in the state who knows the real relationship existing. Although every effort has been made to locate the couple so far they have not yet been found and the presumption is that having learned through the newspapers the real facts in the case and in all probability after the marriage ceremony had been performed, they will seek another residence where they will be entirely unknown.

EDWARD K. McPHERSON.

The news of the death of Edward K. McPherson, secretary of the Chicago College of Pharmacy, was a great shock to his friends. In December last he became ill with what was at first supposed to be the grippe, but which later developed into typhoid fever. In spite of the efforts of attending physicians, he grew steadily worse, until after nine weeks of suffering, he passed away February 8, 1894.

Mr. McPherson was born in Washington, D. C., June 28, 1853, and during boyhood attended the public schools in that city, later going west and studying for a year at the Chicago University. He began his pharmaceutical career in the store of his father, H. H. McPherson, in 1872, and was engaged there until the latter part of 1879. He then entered the junior class of the Chicago College of Pharmacy and received his diploma in 1881, and shortly became a partner in his father's business, also joining the membership of the college. So active was his interest in the affairs of this institution that in 1891 he was elected a trustee, and the following year was made secretary, both which offices he filled with great credit until his death. He was, too, a zealous member of the Alumni Association and had served for three years as its secretary. His name stood for several years on the enrollment list of the Illinois Pharmaceutical Association. He was an educated and conscientious pharmacist, an enterprising and successful business man, and above all a thorough gentleman. He won hosts of friends and built up a prosperous business.

In 1884 he married Miss Carrie Lyke, of Chicago, who survives him, as do his aged father and his sisters. Funeral services took place at his home, No. 1 Park avenue, and interment at Rose Hill cemetery with full Masonic rites, amid a profusion of flowers, the gifts of loving friends. The college has sustained a heavy loss in his death.

James Milne Smith, a wealthy man who died in Boston a short time ago, was born at Arbutnott, Scotland, and served an apprenticeship of seven years with Duncan Flockart & Co., druggists, in Edinburgh. Then he came to Canada for five years, and came to Boston in 1854. He was with the firm of Carter, Colcord & Preston, wholesale

druggists on Hanover street. For many years he was treasurer and general manager of the Suffolk Brewing Co., of South Boston. Soon after his arrival in Boston he became connected with the Scots Charitable Society, and for many years was the most active of its members. For two years he was its president (1854-5). He was also instrumental in infusing new life into the British Charitable Society, whereby its membership was trebled, and for nine years was its president. He was a prominent member and trustee of the De Moly Commandery of Knights Templars, as well as of other Masonic bodies. He was energetic in business, and his exceptionally strong characteristics brought him up from small beginnings to be a man of great wealth. He was a liberal giver to societies with which he was connected, and also to churches. Last summer he had an extended visit from James Buchanan, who was associated with him as apprentice in Edinburgh, and is now sole proprietor of an extensive wholesale druggist business there. Mr. Smith had three sons and two daughters.

A. M. Pett, representative of the Tilden Co. in Iowa, died at Manchester, Ia., March 1. Mr. Pett has been in the pharmaceutical and fluid extract line for the past twenty-five years and had a host of friends among the trade and profession. His home was at Winona, Minn.

Robert Emory Sellers, Sr., inventor of several patent medicines and formerly in the drug business on Wood street, Pittsburg, died February 1 in the 80th year of his age in Plainfield, N. J., at the residence of his son-in-law, W. G. Lord. The deceased had been failing in health for some years, and death was due to general debility. Mr. Sellers was a resident of Pittsburg for several years, and was well and favorably known here. He was a brother of Frank Sellers of this city, and is survived by five children. The funeral was held in Plainfield.

Frank Voelker, a well-known young pharmacist of Cincinnati, died of pneumonia on the 3rd inst. after a long term of illness. The deceased was an exemplary young man and was identified with the drug business in the Queen City for several years. He served his apprenticeship with the erstwhile wholesale firm of Chas. E. Potts & Company, and subsequently acted in various capacities with a number of houses. He then engaged in business for himself in the West End, but met with reverses. At the time of his death he was the manager of F. Exner & Co.'s retail store at Fifth & Race streets.

An Innocent old lady who inquired of a Maine drug clerk for balm of joy, was sent across the street to a liquor agency. The clerks in that part of the country seem to have no difficulty in translating queer orders.

H. A. Smith, a druggist of Binghamton, N. Y., who has been in business thirty-four years, is arranging to sell out to his clerk, William French. Mr. Smith has decided that he cannot take his money with him when he dies, and, therefore, intends to enjoy it the rest of his days. He is a lover of fine horses and the happy possessor of two of the best matched teams in the city.

NEW YORK.

New York, March 7.—A friend of the Era correspondent in the legislature at Albany writes, including a bill, which is given below, and asks: "Have you seen or heard of this measure?" This bill was introduced in the Assembly on January 16 by Mr. Southworth, was read once and referred to the committee on public health. It is entitled "An act to confer upon the state board of health power to analyze and examine drugs or medicines known as patent or proprietary medicines, and regulating the sale thereof." "The bill has never been reported, and it probably never will be," writes the informant. The full text of the bill is as follows:

Section 1. In addition to the powers now conferred by law upon the state board of health said board is hereby empowered, and it shall be its duty upon receiving a bill therefor of fifty dollars, to cause an examination and analysis to be made, by a practical chemist, of any drug, medicine or mixture of drugs, herbs or medicines, commonly known as patent or proprietary medicines, and shall ascertain and determine whether the use of the same may or may not endanger the public health, and it shall be lawful for any person or persons, or corporation, to sell or offer for sale any such drug, medicine or mixture not prescribed by a regular physician, unless the same shall have been so examined and approved and certified in writing as not dangerous to the public health by said state board of health.

Sec. 2. This act shall take effect immediately.

There is great sport every Saturday afternoon at the tournament of the Wholesale Drug Trade Bowling Association. It is held in a hall which is unfortunately too small to accommodate comfortably all the friends of the competing teams, but there is no lack of sociability nor can there be in a room where every man rubs elbows with two other men. The games are held in Hohnmann's alleys at 409 Pearl street, and last Saturday's competition was the third in the series. There was a big crowd present and the way the friends of the contestants raised the roof with their enthusiastic yells was a guarantee that the drug trade boys have strong lungs. E. A. Sayre, of Seabury & Johnson, was among the spectators, but he saw a number of chances to make the boys feel more comfortable and he improved them. The air was very close in the hall at one time, but he soon had the man in charge of the hall remedy that. Then he saw to it that no man wanted for refreshments, and what glimpse of the game he got was by standing on top of a chair and peering over the heads of rows of spectators. Albert H. Mason, of Seabury & Johnson, looked at the game and appeared to enjoy it, especially when the team from Maiden Lane made a good bowl. Among others who saw the sport and joined in the cheering were Russell Townsend, of McKesson & Robbins; John Clay, of Parke, Davis & Co.; Messrs. Berdorf and Hamlin, of Whitall, Tatum & Co.; J. B. Dakin, of Seabury & Johnson, and W. W. Dixon and W. H. Warren, of E. R. Squibb & Sons, of Brooklyn. George Seabury went into the game, as he goes into everything, with his whole heart and soul, and got just as much fun out of it as anybody could, considering the score. However, the Seabury & Johnson boys are young at the game and will yet give some of the other boys a hard tussle. When the results of the games were announced there were cheers all round and everybody said it was great sport. During the rest between the games the bowlers and their friends mingled

solids and liquids in the usual proportions with great success. The scores in Saturday's games were as follows:

FIRST GAME.			
Seabury & Johnson.....	S.	S. B. S.	8
Tremper	1	0	9 76
De Zeller	1	2	7 110
Dodge	2	2	7 89
Benjamin	0	2	8 91
Seabury	0	3	7 107

Totals	4	9	37 603
McKesson & Robbins.....	S.	S. B. S.	8
Schuster	2	2	6 130
Welch	3	3	4 145
Horn	1	2	6 128
Oehler	0	2	4 150
Timken	2	3	5 148

Totals	8	12	39 642
--------------	---	----	--------

FRAMES.										
Seabury & Johnson.....	39	79	141	157	234	252	343	406	456	503
McKesson & Robbins.....
Umpire—W. W. Tamlyn.										
Scorers—W. G. Herx and C. O. Herx.										
Averages, Seabury & Johnson, 100.2-5;										
McKesson & Robbins, 128.2-5.										

SECOND GAME.			
Seabury & Johnson.....	S.	S. B. S.	8
Dakin	1	1	5 128
Zeller	1	2	7 99
Dodge	0	0	10 89
Benjamin	1	0	9 89
Seabury	1	2	7 113

Totals	7	5	38 659
Parke, Davis & Co.....	S.	S. B. S.	8
Thornton	0	2	8 106
Ahern	4	2	4 161
Benkins	0	2	4 159
Mariager	0	3	7 109
Carr	2	0	8 108

Totals	8	11	31 634
--------------	---	----	--------

FRAMES.										
Seabury & Johnson.....	65	196	163	226	278	322	333	408	453	509
Parke, Davis & Co.....
Umpire—W. W. Tamlyn.										
Scorers—Seabury & Johnson, 101.4-5;										
Parke, Davis & Co., 126.4-5.										

Umpire and scorers—Same as in first game.

The standing of the teams is now as follows:

Clubs.	Games Won.	Lost.	High Score.
W. T. & Co.....	2	0	770
Dodge & O.....	1	0	665
McK. & R.....	2	1	698
P. D. & Co.....	1	1	697
S. & Johnson.....	0	2	559
Bacon & Co.....	0	1	581

Next Saturday the competing teams will be: G. G. Bacon & Co. vs. Whitall, Tatum & Co., and Dodge & Olcott vs. C. G. Bacon & Co.

A member of one of the most reputable firms in this city sends the Era correspondent the following letter, which will be read with interest, although for obvious reasons the name of the writer cannot be given:

"Regarding the different plans that have been proposed to meet the evil of cutting, it seems to us that those most interested have not taken into careful consideration the actual facts and difficulties surrounding the question, which should be carefully considered before any possible plan can be matured in order to meet this evil. It is undoubtedly a fact that some of the most earnest advocates of a plan to have manufacturers and jobbers prevent cutting have been among the first to break faith with their fellow druggists, and any one acquainted with the history of the different rebate plans is well aware that this bad faith is not confined to the retailers or the jobbers, as there are some manufacturers who have broken the rebate price of a competitor's goods in order to induce retailers to order their goods. Every such infraction of a plan places the honest manufacturer at the mercy of the unscrupulous one and injures him in two ways: First, by tying his hands so that he cannot sell his own goods on the same terms as the unscrupulous one; second, leads him into suspicion of furnishing these goods to the retailer himself. At the same time the conscientious manufacturer is at the mercy of the unscrupulous trade of the cutter, which is necessarily large on account of the cut prices at which he sells his goods.

"Again, if jobbers sell to cutters, any attempt on the part of the manufacturer to hold them to account insures an active opponent of such manufacturer, who is ever ready in substituting other goods for those of the manufacturer against whom he has a grudge. The Detroit Plan or the Interstate Plan places manufacturers totally at the mercy of the jobbers, of whom there is a large enough proportion who will not hesitate to sell inferior goods at standard prices for the same of an increased profit, to make this plan impracticable. After a retailer against whom it seems to us that the feasible and practicable plan, if there be such, would be for the retailers in every community to furnish one or more cutters with a fund to be devoted to the purpose of selling goods in the immediate vicinity of the cutter at such prices as would make the cutter weary. The same plan could be adopted by the jobbers with a cutting jobber. In most cases, it would not be necessary to do more than take aim, as in the case of David Crocker, at the store to be destroyed."

"As a general thing, there are some available stores in the immediate vicinity of the cutter which could be made a base for the operations of such jobbers. Retailists must be carefully thought out and the work done so that there shall be no undue publicity; that is, so that the cutters shall not be advertised. I think this plan would be effective if the retailers are as they claim to be, sincerely desirous of accomplishing the downfall of the cutting business. But so far, they have taken themselves like most other mortals. We have a way of looking to politicians to save us from political evils; financiers to save us from financial evils; and the clergy to save us from the evils which are supposed to be in the future; but common sense should teach us that the only way to get ourselves free from the particular evil I have written about is by the use of such power as is given us and with the use of such brains as we may happen to have."

Meeting the gentleman who sent this I was told that the crusade against a cutter in Nashua, N. H., had been managed on a plan similar to the one he suggests, and that if it was tried everywhere the druggists would soon have lots of cutters' store fixtures to dispose of.

A case in which the drug business, politics, the law and the church are all mixed up is that of C. F. Dreher, the postmaster and druggist, of Chatham, N. J. Some time ago Dr. W. J. Wolfe sold his drug store to Mr. Dreher, but even then the store had an unsavory reputation, for Wolfe had been indicted for selling liquor and keeping a disorderly house. Wolfe pleaded guilty to the charges and paid his fine. Then he procured the appointment of Dreher as postmaster of the town. The additional income of this position did not apparently cause the druggist to think that he could now afford to conduct his store in such a way as to give it a better reputation. Those "who knew" could always get a drink there. As the postoffice was in the same store, the people of the town could not help noticing that the law was violated and the better classes began to boycott the place. Those who wanted postage stamps went to the nearby village postoffice rather than to Dreher. Fully one-half the letters sent out from Chatham went by way of the railroad post-office, and even those of the same political faith as the postmaster condemned him for bringing discredit on the party. Now Dreher's clerk, Oscar Achenbach, has stood high in the church and is president of the local branch of the Christian Endeavor Society. The deacons of his church heard the stories about the sale of liquor in the postoffice and asked Achenbach if it was true. The clerk said he had never sold liquor nor seen it sold in the place. Then when Dreher was tried Achenbach swore that liquor was

freely sold in the store to all who asked for it, whether they had a physician's prescription or not. The deacons listened to this with amazement and Mr. Achenbach, it is believed, has only seen the beginning of his troubles. Dreher was, of course, found guilty. An effort will be made to have him removed from the postmastership, and besides that the court has sentenced him to pay a fine of \$150 and costs. Dreher will appeal the case.

The election of officers at the College of Pharmacy will take place on March 20. This is the ticket that was sent out: President, Samuel W. Fairchild; first vice-president, Charles F. Chandler; second vice-president, George Massey; third vice-president, John R. Caswell; treasurer, Horatio N. Fraser; secretary, J. Niven Hegeman; trustees for three years, Hermon W. Atwood, Charles A. Osmon, Gustavus Ramsperger, Charles Rice and George E. Wray. Then came the following, which explains itself:

To the Members of the College of Pharmacy of the City of New York:

The ticket of the nominating committee of the college for 1894 is now in your hands. It does not contain the name of our old friend and fellow worker, Thomas J. Macmahan.

Mr. Macmahan has been a member of the college for twenty-four years, and for the last ten years one of the trustees. He has been a faithful, conscientious member of the college and is now in your hands. It does not contain the name of our old friend and fellow worker, Thomas J. Macmahan.

He has been a faithful, conscientious member of the college and is now in your hands. It does not contain the name of our old friend and fellow worker, Thomas J. Macmahan. Signed, H. W. Atwood, George Massey, Alfred Van Horn, Geo. Wm. Kemp, Henry E. Platt, J. R. Caswell, H. J. S. Hall, B. Bezza, A. Merritt, Albert Platt, E. Carter, F. G. Couch, C. E. Corradi, M. K. Sweitzer, F. W. Norris, Edward Kemp, Wm. Henry Hall, Adolph Tscheppe, Wm. M. Massey, Samuel W. Bowls, Chas. H. Chumley, Ed. Kerley, J. W. Dougan, A. P. Kerley, Theo. H. Sherwood, J. Chester Hasbrouck, F. W. Carpenter, E. A. Sayre, J. J. Molloy, C. H. White.

Now small slips have been sent out bearing the name of Mr. Macmahan for trustee, so that there are six gentlemen whose names are before the voters for election as trustees, only five of whom can be elected.

One could fill a page with quotations from the kind words spoken about Thomas F. Cook when the fact of his change from the house of Merck Co. to the New York Quinine & Chemical Works became known. The Era correspondent gave several gentlemen the first information they had on the subject. Apparently Mr. Cook's change created some surprise in the trade, but it was the means of bringing out just what the drug men think of him, and they spoke their minds in no uncertain tones. In fact, they all agreed that "Tom Cook is one of the finest men that ever walked in shoe-leather." Mr. Cook is remarkably well known all over the United States in his line of business and every friend of his will be glad to hear that he has become vice-president of the New York Quinine & Chemical Works. Now he will remain in New York, undoubtedly an agreeable change for him. Those who used to see him every now and then out west will miss him, but their loss is a gain to the New York trade. Mr. Cook's successor at Merck & Co.'s is Mr. I. Loud, who has been the inside man for the firm and has had charge of the pricing of goods.

He is very familiar with the business of the firm and will take with him the best wishes of everybody. At the time this letter is sent it is understood that Mr. Queneey, of the Meyer Bros. Drug Co., of St. Louis, is to take Mr. Loud's place. Mr. Queneey was to have taken charge of his new work a week ago Monday. He is an experienced buyer.

J. N. Hegeman & Co., have had their first fire in nineteen years. The firemen who put out the blaze at the 59th street store labored under the impression that it was the third Hegeman fire they had been called upon to put out within a month, but they were soon informed of their mistake. The other two fires were at the Hegeman corporation's store on Lower Broadway, a very different kind of a concern. How the 59th street fire started is not definitely known, but it is said that it began at the foot of an elevator shaft and not in Hegeman's cellar. The Hegeman store was a beauty and was the pride of J. Niven Hegeman. It was one of the neatest stores in this city and was attracting trade daily. Some druggists thought it was in an out-of-the-way place, but the transient trade was very considerable, and besides it had the big hotels, the New Netherlands, the Savoy and the Plaza, to draw on and no better class of patronage could be obtained in this city. The loss will figure somewhere between \$5,000 and \$10,000. The cellar is a perfect wreck, and while many articles in the store are still under lock and key awaiting the adjustment of the insurance, it can be stated that almost everything will have to be thrown away. Just as soon as possible the store will be opened for business. Manager Moderwell, of the 59th street store, is now at the 30th street and Broadway store.

Ernest A. Denick has a drug store at the corner of Tenth street and Second avenue. He had a boy employed to do the odd jobs, who was obliged now and then to go down into the cellar of the shop, where there are many bottles, some of them containing wine. After one of his trips downstairs the boy alleged that he had his ears boxed by a ghost. This statement caused some uneasiness around the store and people began to watch for the ghost. One night some of the watchers saw a form emerge from an adjoining cellar-way and promptly threw missiles at it. The "form" turned out to be the owner of an establishment next door to the drug store, and the assailants had to beg his pardon. Then a Brooklyn druggist offered \$20 to anybody who would go into the cellar at midnight. One man tried to win the money, but came out of the cellar before his time was up crying for medicine. The funniest thing about the whole matter is that the ghost must have been a tippler while he was a mortal, for the contents of a special cask of wine in the cellar have disappeared since the advent of the shadowy visitor. It is recommended that a bear trap would be just the thing to keep in that cellar.

Tarrant & Co. have placed in their office a big showcase that contained the exhibit of Hindes, Ltd., at the World's Fair, and will soon make an exhibition of the products of that firm, for whom Tarrant & Co. are the American agents. A consignment of brushes is now on the ocean, but previous to its arrival some very handsome brushes, as well as the woods and bristles used in their manufacture, are shown in the case, which is about 12

feet square and 10 high. There are to be seen the largest half-brush in the world, the smallest and several score more with nothing but their excellence to recommend them. This largest brush was made by people who have been in the employ of the London & Birmingham Company for over half a century. It contains more than 3,000 knots of bristles and has been shown at the following fairs: London, 1851; Paris, 1873; Sydney, 1879; Manchester, 1880; London, 1886; Adelaide, 1887; Paris, 1889; Royal Military, 1890; Kimberly, 1892, and Chicago, 1893.

The building of the Pre-Digested Food Co., manufacturers of Paskola, at 70 Reade street, is a handsome structure of six stories with marble front, and the Era correspondent, who was shown over the building by John B. Russell, late of Parke, Davis & Co., found it a veritable beehive for push and business. On the sixth floor are the digesting vats, with pipes leading to the filling floors beneath, where some fifty girls are employed in filling and wrapping the bottles. The next floor is designed for storage, but up to the present time Mr. Russell reports that it has been impossible to get ahead of orders. On the floor beneath are the handsomely appointed offices of the company. The offices of Mr. A. J. White, Mr. Lyman Brown and Mr. Russell occupy the Reade-street front of the second floor, while the bookkeeping and correspondence departments are directly in the rear. The first floor is devoted to the shipping and printing departments.

A druggist who has a telephone pay station in his store tells me that his profits on the telephone business amount to about \$10 a month. He and all other druggists who have pay stations are interested in the bill introduced in the legislature regulating telephone charges. This bill provides that the charge for the use of a telephone in cities of one million inhabitants or more shall not exceed a rate of \$73 per annum, and grading from that down to \$27, according to the size of the city; that the charge at public or pay stations shall not exceed ten cents for the first five minutes and five cents for each five minutes or part of five minutes thereafter, and that no yearly or monthly subscriber for a telephone shall be charged for the use of a telephone at any public or pay station when he produces a ticket which is to be furnished by the company showing him to be a subscriber. This new arrangement would quite materially reduce the druggist's profit.

Colph, of 207 Bleeker street, is to start a new store on Columbus avenue.

Thomas Horner, brother of James B. Horner, died on March 1 of cancer of the throat.

P. J. Slinger, of Sinker & Wheeler, Peoria, Ill., has been in this city for some days on business.

The Hegeman Co. has settled with the insurance companies for the loss at the store on Lower Broadway, and resumed business last Monday.

The Dix Pharmacy Co., which has been located at 1065 Sixth avenue, is to move into the store on the next corner, formerly occupied by the drug store of H. T. Klein.

The L'Estrange pharmacy at Rutherford, N. J., will soon occupy the new building across the street from its present quarters. The new store is to be fitted in mahogany.

F. K. James, the Eighth avenue druggist, has again been under the weather, but is now attending to business as usual.

Our grand juries in New York county usually have a representative of the drug trade on them, but this month's jury has four. They are Brent Good, James M. Furr, John H. Stead and John H. Banks.

John W. Cox, of the Antikamnia Co., has gone to New Orleans to join his partner, Frank A. Ruf, of St. Louis. They will soon be enjoying the delights of a trip to Cuba and they will stay there for a week or two.

Samuel W. Fairchild has been elected a vice-president of the North Side Board of Trade, which has been organized this week by the business men residing north of the Harlem, in what is known as the annexed district.

R. W. Walker, New York agent for James W. Tufts, reports that among the new stores he has fitted with Tufts' fountains are those of Arthur God, Jersey City; E. C. Sharp, Vineland, N. J., and J. K. Lippen, Salem, N. J.

"Doc" Archie Wilson, of Perry's, in the Sun building, has been laid up for a few days by sickness, but is expected to be as well as ever in a day or two. In the meantime J. W. Batchelder, assistant manager of Perry's, has taken a little taste of night work for a change.

The liveliest part of this city is said to be that part of 28th street that lies between Broadway and Sixth avenue. Yet on neither side of the street is there a drug store and there are two vacant houses in the two blocks, both near Sixth avenue.

E. W. Wilson, western representative of the Dehamme, Deletre Brush Co., is in town for a few days and has met many of his friends in the trade. Mr. Wilson makes his headquarters in Chicago. The company reports trade as continuing very favorable.

Many New York drug trade men will be sorry to hear of the death of T. B. Aitchison, of Rutland, Vt. He was formerly in the drug business in this city and has since been located in Rutland, where he has been at the head of the firms of Aitchison & Connor and T. B. Aitchison & Co.

The stores at the southeast corner of Broadway and Wall street have been leased to William Wilson, a druggist. Mr. Wilson will make extensive alterations for the purposes of his business, but this transaction effectually disposes of the rumor that a sky-scraping building was to be erected at that corner.

Brent Good, of the Carter Medicine Co., has been out west for three weeks with John H. Bird, attorney for the company, engaged in the prosecution of counterfeiters of Carter's Little Liver Pills. Reports to the office here show that they have caused the indictment and arrest of three men and that this particular case of imitation of the company's trade mark will no longer bother the Carter people.

S. M. Strong, of Strong, Cobb & Co., evidently thinks the weather here is pretty good, although New Yorkers have found plenty of chance to grumble at it recently. Mr. Strong announced when he came out that if the weather held good he would probably stay a month. If it was bad he would only stay a week or so. He has been here nearly a month now to the delight of his friends who, however, wonder what kind of weather is called good out in Cleveland.

Among the Brooklyn druggists who are helping the poor by keeping "coal fund" boxes in their stores are W. H. Douglass, 423 Fulton street; Bolton Drug Co., 456 Fulton street; P. F. Wright, Gates and Reid avenues, D. Cameron, Reid avenue and Hancock street, and Morrissy's Pharmacy, Fulton street, corner of Myrtle avenue.

Alfred H. Mason, secretary of the firm of Seabury & Johnson, has been presented with a large, handsomely framed photograph of the faculty and college board of the Montreal College of Pharmacy. Mr. Mason was very much pleased with the present, which was given by the board as a souvenir of his connection with the college as one of its presidents.

H. Baskerville Mason, son of A. H. Mason, of Seabury & Johnson, arrived at Liverpool all right on the Umbria, and is now in London. Another member of Mr. Mason's family, his eldest daughter, Miss Ada, is by this time also in London. Miss Ada Mason is shortly to become Mrs. Lionel Bailey, and previous to the happy event she will reside with her relatives in England. Mr. Bailey is an official of the government civil service.

Among the stores recently fitted with Low Art Tile fountains by Howell & Sangston, New York agents for the company, are those of William Wright, of Atlantic City; E. M. Sedgwick, of Catskill, and John W. Schenk, of Somerville, N. J. Mr. Wright was so well pleased with the Low fountain put in at his board walk branch store that he secured a nine-foot one for his main store. This fountain is a very handsome apparatus with a tile top representing the four seasons of the year.

C. G. Bacon, of C. G. Bacon & Co., gave a dinner to a number of gentlemen in the drug trade at the Imperial Hotel the other evening. They had a royal good time and later on went to the Casino as Mr. Bacon's guests. Among those who enjoyed the pleasures of the evening were Messrs. J. H. Stead, of Whitall, Tatum & Co.; Charles E. Lovitt, of C. G. Bacon & Co.; I. Loud, of Merck & Co.; Charles Welsch, of McKesson & Robbins; R. P. Vanderhof, of J. L. Hopkins & Co.; C. G. Euler, of Dodge & Olcott, and C. Herrmann, of the Maltine Mfg. Co.

The Nichols Chemical Co., of Brooklyn, was among the signers of the call for the meeting of Brooklyn manufacturers to arrange for a permanent organization. The object of the association is: To promptly advise all members of the organization of any proposed national, state, county or municipal legislation in any wise affecting manufacturing interests, to aid the carrying out of legislation in the interest of the manufacturer and the working people employed by the manufacturer, and to prevent by all honorable means the passage of any act detrimental to such interests.

Lazell, Dalley & Co. have had so many calls for the loan for exhibition purposes of their display of bottles now in Hegeman's window at 30th street and Broadway, that they hardly know what to do. The exhibit is that shown at the World's Fair and it attracts many persons to the window, especially at night when the electric lights are turned on. Among those who have asked for the exhibit are firms in Chicago, Detroit, Philadelphia, Newark and Boston. The bottles are worth not less than \$3,500 and great care has to be taken in moving them. Besides that the

firm spends something like \$200 or \$300 in mounting the exhibit. It is no wonder that such a choice collection is in demand.

NEW YORK COLLEGE OF PHARMACY.

Never before in the history of the college was there so much interest in any report about college matters as there was in the story in the Era of February 15 on Mr. Wurthman's speech. This speech and the Era's report of it will long be remembered at the college if for no other reason than that which now calls for this explanation. The seniors have met and declared that they consider that the report was not a true one and in fact have taken the whole matter in a very different light from what was intended. Before making any explanation the Era correspondent wishes to assure the senior class that he is very sorry the report should not have met with that cordial greeting it was hoped it would receive, and moreover, that the Era correspondent is told by the gentleman who furnished him with the report that he still thinks the facts were practically as first stated. In order to show that the informant is a gentleman who has a high regard for the truth this letter ought to be read:

Era Correspondent—It seems that the boys have taken that article about Mr. Wurthman's report from an entirely different standpoint than what was intended. They object most strongly to the term "very enjoyable," and some even claim it was a deliberate falsehood to say he used any such term. I am very sorry to have been the cause of this little trouble, as my intentions were only of the best, and the report was, to the best of my knowledge and belief, strictly a truthful one. I will say, though, that at this writing I am not quite certain whether the words used were "very enjoyable" or "very nice." I am especially sorry about the matter as the boys have passed resolutions protesting against the report.

That seems like a good honest statement, doesn't it? I hope the seniors will believe that the article was not intended to hurt anybody's feelings and that this be considered an apology for any error. Not the slightest reflection on the memory of Dr. Harrison was intended.

J. W. Lining was elected secretary of the senior class at a recent meeting.

At the meeting of the senior class on February 23 Mr. Kussy, who had been elected the class valedictorian, made a motion that the question of having a valedictorian on commencement night be reconsidered. This was immediately opposed by such able orators as Messrs. Horn, Brater and Wood, who all claimed that to haul this question to the front again after it had been knocked down and stamped on three times was an entirely uncalled-for proceeding. The motion to reconsider the matter was lost.

H. W. Atwood, the well-known chairman of the building and electric committees, has been very sick with pneumonia, but will be able to be out in a few weeks.

Burglars made a raid on Clarence, Mo., not long ago. They robbed the drug store and several other stores.

The National Lead Company has sued S. E. Grote, a paint and oil dealer in St. Louis, for \$1,791, alleged to be due for goods delivered.

William T. Green, a prominent lawyer at Carthage, Mo., has been adjudged insane and taken to the state asylum. The physicians say that his mental condition is the result of a liquor cure and an anti-fat treatment which he recently took.

BOSTON.

Boston, March 10.—Druggists who, perhaps, know as much as the average public-speaker-on-all-kinds-of-subjects, must be somewhat amused by some of the awful pictures drawn every year at the State capitol by those well-meaning, but unnecessarily anxious persons who rush up before legislative committees to tell what a horrible fate is in store for the young men of Massachusetts unless there is a speedy revocation of the privilege of selling cigarettes. There was the periodical hearing on the old subject a short time ago, when L. J. Kimball, a dentist, of Lyon, appeared before the committee on public health in favor of the passage of the bill prohibiting the manufacture or sale, or exposing for sale cigarettes with paper wrappers, or cigarette tobacco in any form. He would rather find a bottle of whiskey in his son's pocket than a package of cigarettes. W. P. Cherrington said he appeared as an expert user of tobacco for fifty years; he had been able to leave off using tobacco without injury to his health, but the use of cigarettes had put him on a bed of sickness. Dr. Caroline E. Hastings spoke strongly in favor of the abolishment of the cigarette, and cited instances of the deteriorating influence upon the users, especially upon the nerves and heart. She put in a plea for the rising generation, and that to follow, saying that nothing could rise higher than its source. James J. Dooling appeared as a remonstrant, and ridiculed the position taken by those in favor of the bill. He wanted to know why those who would prohibit did not bend their energies toward amending the present law against selling, by attempting also to prohibit smoking. The reason they did not, he said, was because they felt it would be impossible to enforce any such measure. It is not at all probable that the legislature will ever adopt such a measure as that advocated, but the ideas advanced are interesting.

Registered pharmacists who are making illegal use of their certificates must take care to conform to the laws, for the board of registration in pharmacy is after them closely, and several certificates have been suspended and others revoked because of illegal use. The appropriation made by the legislature of 1893 is bearing fruit. Several raids have been made, and a number of drug stores have been closed. At an adjourned meeting of the board the other day the case of Michael H. Wallace, of Chelsea, who was charged with making an improper use of the certificate issued to him by the board, was disposed of and his certificate was revoked. After considering this case the board voted "that after every opportunity given Michael H. Wallace, with permission to bring any witnesses to the adjourned hearing to testify in his behalf, he has completely failed to controvert the testimony that his certificate has been unlawfully used, and that his previous usage of certificate of which he had three granted him, one original and two duplicates—one of which was unlawfully used in Lowell in 1891—show that he is not a proper person to be intrusted with the rights conveyed by a certificate of registration in pharmacy. It is therefore, the unanimous opinion of the members of the board present that, the case being a most flagrant one, the three cer-

tificates which have been granted him are hereby revoked altogether."

A well attended meeting of the creditors of C. H. Bassett, doing business as an apothecary under the name of J. T. Brown & Co., at 199 Tremont street, was held on March 6. The utmost harmony prevailed and there was manifested an earnest desire on the part of all present to effect some settlement by which Mr. Bassett might be enabled to continue business under more favorable circumstances and without interruption. Emory Grover, to whom Mr. Bassett has made an assignment for the benefit of his creditors, called the meeting to order and made a statement of the condition of Mr. Bassett's affairs as he had found them. The liabilities are \$18,571, including a note for \$10,000 held by Mr. Bassett's mother. The assets are \$13,352, comprising stock and fixtures in the Tremont street store, chemicals and apparatus in the laboratory on Bedford street, and book accounts. Mr. Breck, representing the Boston Ice Co., was chosen chairman of the meeting and J. T. Brown secretary. Mr. Brown thought it would be impossible for Mr. Bassett ever to pay them in full. He was one of the largest creditors and he was willing to accept any reasonable proposition for a settlement. The meeting then voted to approve the choice of an assignee made by Mr. Bassett, and adjourned to meet at the call of the assignee.

An important hearing has been given at the State House by the committee on public health on the bill offered by Mr. McInerney to regulate the sale of secret proprietary medicines containing alcohol. The objection is not so much against the use of the alcohol in the medicines as to have the percentage of alcohol distinctly specified on the package or bottle. W. W. Bartlett, the well-known druggist, favored such a law. Dr. Davenport, State chemist, was rather neutral in his position on the matter. He told of certain medicines in which a great amount of alcohol had been found. He would not seriously object to the bill or one tending in the same direction. Fred L. Carter, of Carter, Carter & Kilham, and E. Waldo Cutler, of Cutler Bros., druggists, remonstrated.

A sensation has been caused at Skowhegan, Me., by the announcement of the financial embarrassment of George Cushing, one of the leading druggists. According to his own statement, his liabilities are about \$14,000, and his wife's about \$1,700, this amount being due on their firm residence on Madison avenue, which stands in her name. Among his liabilities is \$2,500 held in trust for Harry Cushing, his nephew, of whom he was guardian. Of this amount his bondsmen are held for \$2,000. The assets consist of stock in trade, medicines, fancy goods, drugs, artists' materials, store fixtures, etc. The largest creditors are Portland and Boston men, and others are Skowhegan friends from whom he had borrowed money.

Two chemical companies have just complied with the law calling for the filing of annual returns at the State House relative to their affairs. In brief the certificates are as follows: Merrimac Chemical Co.—Assets, real estate, \$141,938; cash, \$65,800; stock, \$101,013; miscellaneous, \$14,374. Liabilities, capital, \$213,832; debts, \$68,633. Net increase for year, \$6,230. Hampden Paint & Chemical Co.—Assets, real estate, \$35,577; machinery, \$11,812; cash, \$14,097; stock, \$13,675. Liabilities, capital, \$50,-

1000, 4-bats, \$24,083. Net decrease for year, \$7,153.

As usual about this time of the year the Boston Board of Police announces that it is ready to receive applications for liquor licenses and that the druggists' fee will be \$1.

J. W. Tufts was last heard from at Lake Maitland, Fla. He will be absent for several weeks.

Improvements are going on at Bissett & Fournay's, Natick, and a Low fountain will be set up.

An association for mutual benefit has been formed by the druggists of Auburn and Lewiston, Me.

P. C. Croy & Co., druggists, suffered a loss of \$5,000 by a fire at Haverhill on the night of February 25.

W. P. Draper's handsome drug store in Springfield is soon to contain a ten-foot fountain supplied by the Iowa.

T. P. Hawkes, of Danvers, whose store was burned, has lately refitted the place, incidentally putting in a Low fountain.

Prof. James F. Babcock, president of the Boston Druggists' Association, and also the State assayer, has lately figured prominently as an expert in a murder case in this State where there was suspicion of poisoning.

Liquor "spotters" have lately been working in Concord and Manchester, N. H., and as a result many druggists are feeling uncomfortable. However, public sentiment appears to condemn some of the methods of these hired spies.

Edwin C. Traver, a drug clerk in Barrs, has become involved in considerable trouble, owing to the fact that, after having become engaged to one young woman, he suddenly married another. Circumstances led to his arrest immediately afterward.

Ell Phelps, a retired apothecary, died at Foxborough a few days ago, aged 70 years. He was a prominent Democrat, and held many town offices. He was treasurer of the Foxborough Savings Bank for the past fifteen years. He had a wife, one son and two daughters.

H. F. Lawrence, of Wakefield; Albert Fenner, of Providence, R. I.; J. F. Burns, of New Britain, Conn.; T. F. Gilligan, of Berlin, Conn.; Cheney Bros., Lindenville, Vt.; H. H. Baskey, St. Albans, Vt.; Starr Bros., New London, Conn., all of whom are druggists, have lately bought Low fountains.

In anticipation of the March winds the Boston druggists make a fine showing of lung protectors in their store windows. This reminds one of the little girl who entered a south end drug store one day with her little black and tan terrier and innocently asked for "one of those red dog blankets in the window."

A very entertaining and instructive lecture took place the other evening at the Young Men's Christian Union, when Messrs. R. W. Drawbridge and H. B. Slade, of Providence, gave the seventh in the course of practical talks to the public, upon "An Evening in the Laboratory," illustrated by over twenty of the most brilliant experiments known in chemistry.

At the monthly meeting of the Boston Druggists' Association at Young's there were about thirty members present. President James F. Babcock read an original poem, "The Druggists' Calendar." The subject of the after-dinner speaking was reminiscent, and concerning the trade. Among the speakers were Ernest Meicall,

Thomas Dollber, Joel S. Orne, Amos K. Tilden, Henry Canning, William W. Bartlett and Albert C. Smith.

Among the New England druggists who have lately bought fountains from J. W. Tufts are Clarence E. George, of East Boston; A. A. Laing, of Cambridge; Chas. E. Hitchmond, Taunton, Thackeray & Kelley, Phil River; R. W. Norton, Kennebunkport, Me.; L. S. Jackson, North Berwick, Me.; T. W. Orne, Boothbay Harbor, Me.

Fred Gonya, of Thurston's drug store at Island Pond, Vt., returns to Portland, Me., on the 12th inst., to his old position in the eye and ear infirmary, with greatly increased prospects of promotion and with better opportunities of becoming an expert in his profession. His place in the drug store will be filled by Charles Vallee, who will leave Norway, Me., in a few days.

An official notification has been sent to the aldermen by the board of registration in pharmacy announcing that the certificate of registration in pharmacy (No. 225) and two duplicates thereof, granted to Michael H. Wallace, of Chelsea, one of which certificates has of late been used in the store of B. McDonough, No. 535 Saratoga street, East Boston, have been revoked.

Some time ago the mayor vetoed the order given the Pulsifer Chemical Co. and E. Grossman the right to project showcases at No. 20 Broad street. At the last meeting of the aldermen, however, the orders were passed, the mayor's veto to the contrary notwithstanding. The committee on public buildings recommended the passage of the order for the reason that business men should be encouraged.

In the jury-waived session of the Superior Court Judge Hammond gave a finding for the nominal amount of \$1 for the plaintiff in the case of James W. Tufts against John E. Bennett. The suit was instituted to recover damages for the breaking of a contract to buy a soda fountain apparatus to the amount of \$2,400. The court found that the defendant repudiated the agreement to purchase, but also said there was no evidence of actual damage to the plaintiff by such breach.

When the new Tremont Temple arises from its ashes and is in good working order the directors of the church society which controls the institution intend to institute some vigorous reforms. One applies to the drug store on the street floor. This will not be reopened unless its doors are closed on Sunday for everything except, perhaps, the compounding of prescriptions. The directors think that the fizz of the soda fountain and the accompanying sale of cigars is not a Sunday necessity.

Eugene Levitan and Leonard J. Pastor have each been sentenced to six months in the house of correction by Judge Sherman in the Superior Criminal Court. They conspired last summer to obtain a certificate from the State Board of Pharmacy, in the name of Levitan. Levitan was wholly incompetent to pass the examination of the board, and so it was planned to have Pastor, who was capable of passing the examination, take it under the name of Levitan. This plan was carried out. Later, however, Pastor tried the examination in his own name, and was caught. The men said they were impelled to attempt the fraud through hard circumstances. Up to the time they were sentenced they had been twelve weeks in jail.

PHILADELPHIA.

Philadelphia, March 10.—This city, as far as the drug business is concerned, is leader (thru a western mining town after the mines have petered out. While there is some business being done it is in such small quantities that it hardly pays for the trouble of putting it up. This condition of affairs is not confined to any one house; but to nearly all, although there are one or two instances where better business is reported. But in such cases the trade of these houses has been very light and their customers have only been buying from hand to mouth until their supply had become exhausted and they were compelled to renew some of their wares.

The following committees have been appointed by President Wm. J. Miller, of the Philadelphia Drug Exchange:

Publishing—M. N. Kline, Jr. A. W. Miller, Dr. R. V. Mattison.

Legislation—Alexander H. Jones, Edward H. Hance, H. N. Rittenhouse.

Membership—L. Hassel Lapp, John Ferguson, C. E. Hires.

Room—H. B. Rosengarten, John Ferguson, Edward H. Hance.

General Information—H. N. Rittenhouse, M. N. Kline, Dr. R. V. Mattison.

Arbitration—Dr. A. W. Miller, Alexander H. Jones, H. B. Rosengarten, L. Hassel Lapp, Wm. Gulager.

The junior class of the College of Pharmacy has been having a busy time during the past two weeks. Three hundred and forty-nine of its members were examined in operative pharmacy on Saturday, March 3. This is the only institution in the country where the juniors are examined in practical pharmacy, but the faculty believes that it is essential to advance its standing at the same time that theoretical knowledge is acquired.

The first preparation to be made was a medicated water, these materials being furnished:

Camphor, 1 gm.
Alcohol, 1 c. c.
Prec. calcium phosphate, 1 gm.
Water, q. s., 125 c. c.

An ointment was next in order, with these ingredients:

Red mercuric oxide, 2 gm.
Castor oil, 1 c. c., (vel. gtt. xv.)
Ointment, 17 gm.

Then came a granulated salt, as follows:
Acid salicylic, 7 gm.
Sodium carb. c. p., 6.5 gm.
Dist. water, q. s.
Make sodium salicylate.

Prof. Bastin has made appreciable improvement in the microscopical laboratory and more students are being instructed in pharmacognosy with the aid of the microscope than ever before. It is probable that next term the course will be made more general, and microscopical work will take its place by the side of that in the chemical and pharmaceutical laboratories.

The next meeting of the board of trustees is to be one of importance, involving the election of two new members to fill vacancies created by the death of Prof. Maisch and the retirement of James T. Shinn when he was made treasurer.

The Alpha Phi society of the junior class was mine host in a genial way on Tuesday evening, March 13. Its annual banquet held at the Hotel Metropole was on a more extensive plan than heretofore attempted. As guests of the society were

Prof. Joseph P. Remington, Henry G. Trimble, Samuel P. Sadtler, Bastin, Frank G. Ryan, Frank N. Moerk, Dr. C. B. Lowe, and Actuary T. S. Wegland. Mr. Wegland responded to the toast "The Class of Fifty Years Ago," of which he was a member, and recalled to memory many of his classmates of familiar names.

Dr. J. B. G. Pidge delivered an entertaining address at the March Alumni social meeting. His subject was "From the Flowery Kingdom to the Equator."

The Distillers' and Cattle Feeders' Company is generally hated and feared by most of the wholesale and retail druggists of this city. While they are not anxious to purchase from this company, they are afraid to go elsewhere as they are inclined to think that they will lose their rebates, but since the Gottschalk whiskey rebate suit against this trust was tried in Chicago and a favorable decision has been intimated there has been more nerve infused into the dealers here. It is said a decision would have been given before this if the lawyers of the whiskey trust had not objected to a decision being given in vacation, so the judge reserved it until the next term of the court. It is generally thought that the decision will be in favor of the plaintiff and if such should be the case, as every purchaser of spirits hopes will be, the Distillers' and Cattle Feeders' Company will have to pay back a large sum of money. It is said the decision holds that if a customer is cut off by the "trust" he does not lose his rebates by buying from the opposition. There is a promise of a big fight in this city against the "trust," for a suit has just been begun by Koehler & Son, wholesale liquor dealers at 110 Front street, against the American Distributing Company, local representatives of the American Distilling and Cattle Feeding Company. This action grows out of the refusal of the trust to cash rebate vouchers for Koehler & Son, on the ground that the firm bought whiskey outside the trust in violation of the agreement. Besides this suit there is another one pending, which was brought some time ago. A few days ago there was a notice sent around to all the stockholders of the trust inviting all stockholders who are dissatisfied with the present management of the whiskey company to send their names and number of shares owned to the committee with a view of arranging for a meeting of the owners of the property and the appointment of a committee to act in their interest.

P. G. A. Weber, who for many years kept the drug store at Fourth and Susquehanna avenues, died on Monday, February 26. Mr. Weber was a well-known society man. He was a member of the Pblates Lodge, No. 527, F. and A. M., Corinthian R. A. Chapter, No. 250, Pacific Lodge No. 20, I. O. O. F., Leni Lenape Tribe, I. O. R. M., Liberty Council O. U. A. M., nineteenth ward sectional school board, anti-Cobden Club, Metropolitan Club and others. The funeral took place on the following Thursday afternoon and it was a very large one.

The death of E. A. Crenshaw, which was reported in the last issue of the Era, was a sad blow to all his friends. The death of Mr. Crenshaw will not make any change in the firm. This house consists of Charles Bullock, Sylvester J. Baker and John G. Bullock. It is understood that Mr. Crenshaw's interest has been withdrawn.

Charles Lippincott is busy getting out

new soda fountain designs for the coming year and they are more handsome than ever. He has just issued a pamphlet circular which shows the different styles of fountains manufactured by this house. This firm has removed its Chicago sales-room from 341 Dearborn street to 264 and 266 Fifth avenue.

Peter S. Brugh's pharmacy at Columbia, Pa., has been sold to Harry W. Zeamer.

Mr. Lind, of the firm of Schandein & Lind, has returned from a business trip to the south.

Fred W. Krollpeffer has purchased J. B. Reynolds' pharmacy at Amber and Dauphin streets.

Russell T. Blackwood has made his store at Fifteenth and Thompson streets one of the best appointed pharmacies of the city.

James T. Shinn, Ph. M., an old and much respected pharmacist, has been elected treasurer of the College of Pharmacy.

Edward McCandless has purchased the store at Sixteenth and Mifflin streets, which recently became the property of Harry Lee Barber.

A. Eugene De Reeves has established himself in the old Amos Yarnall store at Fifteenth and Market streets, a pharmacy of forty years standing.

A. S. Butz, of Kutztown, has bought the drug store of Dr. W. O. Higgate, 4202 Lancaster avenue, who goes into private practice in West Philadelphia.

French, Cave & Co. are working overtime and find it difficult to keep up with their orders on soda specialties, and compound extract of sarsaparilla.

One of the fine pharmacies which adorn North Broad street is that of W. H. Laubach, Jr., at Broad street and Grand avenue, which includes among elegant fixtures, a Lippincott fountain.

Walter F. ("Mizpah") Ware has purchased Mr. Rhoades' interest in the Elma Confection Co. and now has charge of the management of that concern in connection with his own business of rubber specialties.

The Apothecaries' Union has secured quarters down in the heart of the city. The building 610 Arch street has been secured and by the middle of this month it is expected that the union will be occupying their new quarters.

Dr. H. C. Watt is fitting up his new store under the new depot of the Pennsylvania Railroad Company at Broad and Market streets. This store is to be one of the handsomest in the city and is to have all the latest appliances.

The works of the Hero Fruit Jar Co., at Gaul and Adams streets, are again in full operation. Some hundred hands, glass blowers and helpers, who have been out of employment since June 30 of last year, have resumed their places with every prospect of steady work for the balance of the season.

Charles E. Hires Company is making preparations for a busy summer and has commenced sending its men out to all parts of the country. It is the intention this year to have about thirty men on the road outside of their regular district ones. A new store will be opened in Chicago, and there is a possibility that the company will purchase a bottling plant and do its own bottling.

John M. Maris & Co., in speaking of the business situation as applied to them, said a few days ago that their business

has improved very much since January 1 and their sales for the first two months of the year show a very gratifying increase of the corresponding period of last year. Their engraving and lamp shops which have been recently enlarged, are running to their utmost capacity, and they shall have to still further increase them in the very near future.

Liquid malt extract would seem to be very popular in this city if the large number of druggists who fill their windows with this article is a criterion. One leading Chestnut street pharmacy has an enormous display, the tasteful and artistically designed labels being very attractive. Perhaps the physicians are "on to" the fact that several fine brands are manufactured here. Or perhaps there is a good margin of profit both for maker and retailer; anyway we know of one prominent druggist who has quit rolling pills and expects to make more money extracting malt.

Robert C. Cadmus, of Twenty-first and Mount Vernon streets, can now boast of having one of the handsomest soda fountains in the city. It is different from the general run of fountains, and being designed to stand in the window, is carved and polished all round and presents a very attractive appearance from the outside. C. Lippincott & Co. are the manufacturers; the cost is said to be \$2,700. The apparatus is named the "Campania," having a capacity of eighteen syrups and six draught tubes. It is constructed of Mexican onyx, almost a pure white, with Breccia sanguine and French Grottoe trimmings. The roof is supported by eight elegantly carved columns, the space where the mirror usually is being left open to admit light from the window. Mr. Cadmus says he is prepared to meet an almost unlimited demand for frigid soda the coming season.

FROM THE SOUTH.

G. A. Vinson has bought out J. F. Beck at Clara, P. O., Atlanta.

The Southern Glass Co., Atlanta, which has been incorporated, has started its works.

J. H. McFall is contemplating building a new store on Marietta street, near Simpson, Atlanta.

U. H. Smith, of Phoenix City, Ala., has bought the Vernon pharmacy from Brannon & Carson, of Columbus, Ga.

G. P. King, of Cartersville, Ga., succeeds Budwell & Willet, on Mitchell street, near Mangum, Atlanta, Ga.

The Bridgeport Bottling Works, Bridgeport, Ala., has resumed operations after being shut down for some time.

D. W. Curry and Hammond & Lucas, of Rome, Ga., have each put in a very handsome Lippincott's soda apparatus.

H. M. Lee, Atlanta, is moving his store from the National Hotel building to the store corner Peachtree and Walton streets.

In the wholesale drug house of Lewis, Baillie & Co., Shreveport, La., an explosion of chemicals took place, setting fire to and totally destroying the building and stock.

The following traveling salesmen have been in Atlanta within the last ten days: A. G. C. Libby, of Beach & Claridge; J. F. Sprague, of Sharp & Dohme; S. P. Watson, of W. H. Schieffelin & Co.; R. P. Menard, of Irwin, Kirkland & Co., Decatur, Ill.

CHICAGO.

Chicago, March 10.—About twenty pharmacists met in Lakeside Hall, Thirty-first street and Indiana avenue, March 2, in response to a call to consider the Hayes plan to prevent the cutting of prices on patent medicines, explained by Messrs. Goetz and Sempill. No great alacrity in putting up money was manifested until the matter should develop further.

The schools of pharmacy seem to be well patronized this season.

O. F. Alex is about to leave the neighborhood of Woodlawn park.

Fifty-ninth street pharmacy, Knothe & Co., has been sold to Emil Thiele, "ex-senator."

Frank McIne succeeds the firm of Curtl & McRae, Sixty-third and Cottage Grove avenue.

Otto Cottzau and family are at present in California, possibly visiting the fair at the same time.

J. F. Carnegie, Sixteenth and Michigan avenue, is making arrangements for a trip for his health.

Albert Schreiner, of Michigan avenue and Thirtieth street, is about to move to South Evanston, Ill.

S. P. Herron has received news that his family horse, which he was wintering in the country, has died of heart disease.

Albert Ackermann, Halsted and Fifty-first, on bright days may be seen exercising his new trotting horse on the boulevards.

G. G. Shauer, State and Twenty-ninth streets, has been on a trip to West Superior, Wis., among the lakes "duck hunting."

E. Von Herman, Indiana avenue and Thirty-first, has taken out a building permit to alter and enlarge his premises on Thirty-first street.

Morrison, Plummer & Co.'s sundry department is new and finished in fine style, being now considered one of the most complete in the west.

There are many drug clerks out of employment and few vacancies to offer them at present. Nice weather will brighten up matters for "the boys."

H. S. Lester, manager of Knothe & Co.'s Forestville pharmacy, was called home to Salem, Ill., by the illness of his father, who died Saturday, March 3.

Frank J. Imes, of Grand Crossing, Ill., came in to select his spring sundry stock of Morrison, Plummer & Co. Mr. Ballard gave him a warm welcome.

Dr. T. N. Jamieson was charged with selling liquor without a license. The case was dismissed when Dr. Jamieson swore that he did not own the drug store referred to.

The mills and shipyards are once again at work in South Chicago, thus cheering the hearts of all the druggists and other merchants with the hope of a more prosperous business.

Mrs. A. E. Ebert had an operation performed, which was necessitated by her severe burning. She is not improving as rapidly as her friends would like, but full recovery is expected.

Mr. J. W. Rausch, of Rausch Bros., 284 Cottage Grove avenue, died Thursday morning, March 8. Cause, accident. He stepped on a broom handle when going down into the basement, injuring his head and bursting a blood vessel in the neck.

Curtl & McRae have been lavishing some of their world's fair profits on their store, thus enhancing its attractiveness. There is a new store booked on the opposite corner for May 1st.

Mr. F. H. Galtreth, representing Robert Stevenson & Co., in making his usual trip to Elgin, Ill., the last part of February, had just reached his hotel when he slipped and broke his leg. Quite fortunate that he holds an accident policy.

Sorrow & Kerntoff have opened a new store No. 540 Cottage Grove avenue at the intersection of Washington and South parks. Mr. Sorrow has been called to Dayton, O., leaving Mr. K. alone with the contract of opening the cosy store.

W. W. Swearingen, of east Sixty-third street, or Woodlawn park, had made arrangements to discontinue his world's fair store, but at the solicitation of his friends and patrons he will continue business at the old stand east of the Illinois Central railroad tracks.

Mrs. I. H. Ruby, who has worked so hard in the interest of women in pharmacy, has been suffering from rheumatism since the opening of the new year. Miss Gordon, her associate at the world's fair pharmacy, is now conducting a paying pharmacy in the new Marshall Field building.

C. A. Seamon, one of the Englewood druggists arrested in a recent raid on illegal dispensers of whisky, was fined \$50 and costs by a jury in the Hyde Park police court February 28. Seamon is not a licensed druggist, but has been doing business at 6438 State street since August.

In the Cook County Criminal Court Davis has also pleaded guilty to an indictment under the state law found by the grand jury for imitating and using imitations of the Apollinaris labels. The penalty for violation of the law is a fine of from \$100 to \$200, or from three months to one year imprisonment, or both. Sentence was suspended.

Dr. W. H. Carter, of San Francisco, was put in the Chicago jail two weeks ago on an indictment charging him with counterfeiting the trade mark of the Dr. Carter Medicine Co., of New York. C. D. Brown and E. N. Habersham, who were indicted on the same charge as Dr. Carter, were released on bail. It is claimed in the indictment that the three men have done an extensive business with bogus labels.

In the injunction suit of the Apollinaris Co. (limited), of London, England, against Charles T. Davis and other defendants, before the United States District Court for the northern district of Illinois, Judge Grosscup has entered a final decree perpetually enjoining the defendants from imitating the yellow Apollinaris labels and from in any manner pursuing a course of unlawful or unfair competition in trade calculated to injure the Apollinaris Company's business or reputation.

A. W. Fenner, Jr., of Providence, is making many changes in his store, and has placed with the Low Art Tile Co., an order for a \$2,000 fountain. He has used one for the last four years and is so well pleased that he has given an order for the larger one. Others placing orders with the Lows are J. H. McCorrison, Campello; P. F. Whalen, Webster; P. V. Joyce, Ballardvale; W. R. Jones, Frankestown, N. H.

COMMITTEES OF THE DRUG TRADE SECTION, NEW YORK BOARD OF TRADE.

Membership—James Hartford, of Schoellkopf, Hartford & MacLagan, limited; Albert Bruen, of Bruen Bros. & Ritchey; C. S. Little, of R. W. Robinson & Son; Samuel M. Moneypanny, of S. G. McCotter & Co.; W. H. Harer, of Tyley & Finch.

Legislation—Albert Plant, of Lehn & Pink; Frederick G. Meyer, of Meyer Bros. Drug Company; Geo. R. Miller, of R. Miller's Son Co.; Christopher L. Williston, of Charles Elzer & Co.; Andrew H. Rogers, of Rogers & Pyatt.

Arbitration—John Clay, of Parke, Davis & Co.; John A. Riker, of J. L. & J. B. Riker; W. E. Harer, of Tyley & Finch; Joseph Vebor, of Peck & Vebor; Frederick M. Robinson, of R. W. Robinson & Son.

Jobbing druggists—William S. Mersereau, of W. H. Schloffel & Co., chairman, and one representative from each jobbing drug house in the drug trade section.

Manufacturing chemists—Harry T. Jarrett, of Mallinckrodt Chemical Works; William A. Ramana, of the Rossier & Hasselacher Chemical Co.; B. H. Huttman, of Glantz & Huttman; Edward H. Kilder, of New York Coal Tar Chemical Co.; Howard Kirkland, of New York Quinine & Chemical Co.

Manufacturing petroleumers—Sturgis Coffin, of Ladd & Coffin; Theodore Klecksecker; Henry Dalley, Jr., of Lazell, Dalley & Co.; Bowles Colgate, of Colgate & Co.

Manufacturing pharmacists—Benjamin T. Fairchild, of Fairchild Bros. & Foster; Samuel W. Bowne, of Scott & Bowne; E. H. Mason, of Seabury & Johnson; E. Stoffregen, of Sharp & Dohme; Charles Kikore.

Importers of drugs and chemicals—John H. Stallman, of Stallman & Fulton; George Massey, of Lenman & Kemp; Theodore Welcker, of Merck & Co.; Francis H. Sloan, of Dodge & Olcott; John J. Riker, of J. L. & D. S. Riker; Bernard G. Amend, of Elsner & Amend; Victor Koehli, of Schulze-Berge & Koehli.

Importers of essential oils—George H. Olcott, of Dodge & Olcott; Carl Brucker, of Fritzsche Bros. & James B. Horner.

The standing executive committee of the section is as follows: Samuel W. Fairchild, of Fairchild Bros. & Foster; Am. H. Wickham, of Jamieson & Robbins; James Hartford, of Schoellkopf, Hartford & MacLagan, Ltd.; Thomas F. Main, of Tarrant & Co.; John M. Peters, of Frazier Tablet-Triturate Manufacturing Company.

W. R. Wattles, who has two drug stores in Providence, R. I., is reported to be financially embarrassed.

Work is rushing in the marble department at J. W. Tufts' soda fountain works, Boston, Mass. Onyx productions especially are in demand.

At the annual meeting of the Bagley Dandelion Compound Co., held at St. Johnsbury, Vt., Robert Mackinnon, E. H. Blossom, C. D. Bagley, J. B. Gage and Dr. T. R. Stiles were elected directors.

Here is a summary of the returns filed at the state house, Boston, Mass., by the Weeks & Potter Co.: Assets, machinery, \$5,000; cash, \$81,625; stock, \$156,662; miscellaneous, \$9,685. Liabilities, capital, \$200,000; debts, \$33,974; net decrease for year, \$220.

Hall & Lyon, of Waltham, Mass., and Providence, R. I., have purchased the old drug store of C. B. Burrington on Broad street, Providence. They will make many improvements, and run it as a branch of their Westminster street store.

Much excitement was caused in Providence recently by the reported failure of J. E. C. Davenport at the store occupied so many years by A. L. Calder. It is stated that he owes \$36,000 and that the store will be discontinued.

BUFFALO.

Buffalo, March 10.—Business was very bad during February. Not only were the retailers lacking customers, but the wholesalers confess that they have not had a worse month for years. In all branches of trade it is the same; nobody did anything. The general rule was to keep open and wait. The fact is that so many things are brought in under the head of luxuries in hard times that drugs and medicines belong in that category. The common people have no money to buy anything more than they are obliged to, and when they are sick they patronize the free dispensary. Still nobody complains. The druggist always keeps some trade alive and it is rare to find anybody going to the wall. There is prospect of a fair trade again and with it a slow edging out of the stagnation that has been reached.

Buffalo druggists have gone into trade authorship somewhat of late. They not only took a leading hand in the preparation of the new edition of the pharmacopoeia, but they are going into private ventures. Dr. John R. Gray, of the college of pharmacy, has just published a Guide to the Study of Pharmacognosy, which is likely to become a standard work on the subject. Dr. Long, of the college, has put out a second edition of "Long's Tablets."

Dr. Hill, of the college, has just been making a lot of tests of Niagara water in his capacity of city chemist. Some time ago the towns on the river below Buffalo complained that they were suffering from sewage from this city and threatened to bring suit for damages. So the board of public works got ready for them. The samples show considerable sewage just below the opening of some of the big city sewers, as might have been expected, but at Tonawanda there was no appearance of it, while at Niagara Falls it appeared again, apparently from some local cause. The test reaffirms the old idea of running water purifying itself in short distances.

The city office of bacteriologist, which was created only a year or two ago, has had some queer experiences, or rather the officials have. Dr. W. H. Bergtold, who first held the position, was one day horrified on examining his own sputum as a matter of exercise to find that it contained bacteria of tuberculosis. He at once repaired to the Saranac Lake Sanitarium, where he has since remained. It is now reported that he considers himself cured and is about to come home again. Dr. H. U. Williams, his successor in office, has now resigned and will go to Germany to study bacteriology.

The County Board of Pharmacy granted only one license at its second February meeting. Isaac Saylen, who is engaged at Herman Frost's drug store on Broadway, receiving full pharmacist's papers. There were four applicants examined at the first March meeting. One paper was written in German and the members of the board took a hand all round in translating it. One of them who wanted to call *Fluessigkeit* "physic" was promptly discharged from the committee on translation, and the member who tries to pass for a native German was given the say. The chair thought that the original text was good enough for official purposes, whether it was turned into English or not. George Reimann, of the board, is somewhat out of health and has gone to

Jacksonville, Fla., to recruit. He was getting ready to sell his store, but has concluded not to at present.

It is quite a neat trick that some of the city druggists have adopted for attracting attention to their places. They post in their windows lists of goods, patent medicines and other well-known preparations, showing great reductions in them. An unsophisticated observer would imagine that there was a war going on that threatened to upset the whole trade. The fact is, though, that these particular articles are selected from a list that is not protected by any agreement and which anybody is at liberty to sell at his own price. The dry goods stores have lately got hold of a few brands of dentifrices and cosmetics and are selling them at cut rates, but the protected articles are held as firm as they ever were.

Speaking of protection our druggists who have lately been in Canada bring back word that the trade in Hamilton has set up a plan of its own, which appears to be satisfactory at home if the proprietary people do not admire it. They have organized the Hamilton Chemical Company, which is manufacturing a full line of goods to run in opposition to advertised preparations. The concern is a stock company and sells its goods to members only. In this way outsiders are unable to get hold of anything in the line and it is easy to prevent price cutting among themselves. So far our druggists look up on the scheme with favor, but it is doubtful if they would go into anything of the sort.

There is another movement in Canada which is distinctly in advance of us, however the Hamilton idea may be regarded. Druggist Clark, of the City Arcade of Hamilton, who was for several years president of the Ontario Board of Pharmacy, went to St. Catherine's lately with a new bill making it illegal for people without druggists' licenses to sell proprietary medicines containing poisons. This is a step in the Canadian plan of shaping legislation beforehand. There is a parliamentary election not far off and this bill is shown to the candidates and the support of everyone obtained if possible before election. The present Canadian law on the subject is similar to ours. It forbids the filling of prescriptions or making up of doses by non-licentiates, but it permits anybody to make up any sort of nostrum, put his name on it and sell it as a proprietary medicine. In case of cough medicines where opium is pretty sure to be present, this proposed law has especial pertinence, for certain mixtures in this class could be named which are as strong with opium as ordinary laudanum.

W. D. Balliett, druggist of Middleport, failed last month and made an assignment to W. H. Garland, of that place.

T. V. Bauer, a college graduate, has bought the Genesee street pharmacy owned by the late A. E. Romer, whose death was chronicled in this column some months ago.

The Tonawanda store of William Coulson, the Buffalo druggist, took fire one night lately and was damaged about \$1,000. The origin of the fire is unexplained. The loss is covered by insurance. The store is occupied by F. L. Hill.

The local mineral water people are making some headway in business and will flourish as soon as business is good generally, for it is a fact that there is a

marked increase in the popular demand for mineral waters, especially for tabular.

Thomas Talbot has sold his Rhode Island street drug store to C. W. Turker and has moved his stock to the drug store on Forest avenue, formerly occupied by Burnham Bros., who located in Jamestown.

The Beta Phi Sigma society of the College of Pharmacy held its annual banquet on March 8. Plates for about seventy-five were ordered. Many of the graduates belong to this first Greek letter society of the college.

Udell S. Braman, manager of Gregory's Niagara street pharmacy, is just back from a short trip to New York. It is so unusual for the average drug employe to get away from his bottles and mixtures in winter time that this should be set down as an event.

Health Commissioner Wende is complaining of shortness of help, as four men in his department are off sick. As a rule, though, the city is quite unusually healthy, having escaped the grip again very much as last winter, when other sections suffered from it severely.

Chairman Smither, of the County Board of Pharmacy, is our most active alderman and a very useful member. He is chairman of two important special committees, one on municipal lighting and one on telephone rates. The former will report in favor of spending \$100,000 on a new electric light plant to be run by the city.

Our proprietary people are not nearly as favorable to the bill in the state legislature providing for the publication of formulae on the packages as the general druggists are, and it is said to be calculated to kill the morphia business, but many say it is not as objectionable as last year's "strike bill," as it was called, which made every patent medicine man the prey of a board of examiners.

Dr. Vandenberg, the chemist, is back into experiments in gas for fuel and illuminating. Some capitalists from Olean have set up a sort of factory down among the city gasometers on the canal bank and have for some time been at work on a combination of water, oil and steam, which they hope to dignify into cheap and serviceable gas some day. They have lately called in the aid of Dr. Vandenberg and he now has two cylinders full of the gas in his laboratory for analysis. So far he expresses no opinion on its merits.

The college of pharmacy is bound that its students shall tackle everything of practical value that can be brought into a class or lecture room. Dr. Gregory lately gave a lantern-slide exhibition of difficult prescriptions which he had gathered together in his experience, thus bringing into an hour an amount of this sort of perplexing material that would take the practitioner a long time to accumulate. The senior class in the medical department will attend these exhibitions hereafter. The list of incompatibles, poisonous combinations and obscure mixtures brought to the light was very great. The recent case where a victim was killed through a mistake made by a physician was referred to. The druggist was also careless, or he might have detected the error and saved the life. The doctor was made to pay damages, and druggists confess that had the man who put up the prescription been proceeded against he would also have had to suffer.

CINCINNATI.

Cincinnati, O., March 10.—The druggists of this city, and in fact all over Ohio, are considerably perturbed over a proposed amendment of the pharmacy law, which will soon be brought up in the Legislature at Columbus. Numerous attempts have been made to amend the Ohio pharmacy law so as to permit of the interchanging of certificates and the registration of men having been in the business a stipulated period without examination. All these attempts have been flat failures and those who are unable to pass an examination have been unremittent in their labors to have the law made more lenient. The defeat of these various measures is attributed to the litter and almost ceaseless combat waged by the members of the Ohio State Pharmaceutical Association. Now comes Senator Abbott, of Morgan County, with a bill, which will probably please one of his personal friends, who has been "turned down" by the Board of Pharmacy.

The pharmacists throughout the state are on the alert, however, and an organized fight will be made to defeat the passage of Senator Abbott's little bill. A circular sent out by the committee on pharmacy of the O. S. P. A. is presented on an editorial page of this issue:

There is quite a lively scramble among the local druggists for the position of government drug inspector at this port. The position will soon be vacant and is at the disposal of the appraiser of the port, and the new man must be an administration Democrat. John Bauer, the druggist at Sycamore and Milton streets, is the present incumbent and a half-dozen "pill rollers" are ready and willing to succeed him in the service of Uncle Sam. The most prominent candidates spoken of thus far are Joseph Hall, the druggist at the City Hospital, and Ed. P. Dehner, the clever young pharmacist at Seventh and Vine streets.

There will be a number of changes in the faculty at the College of Pharmacy when the fall session convenes. William Simonson has been called to the materia medica chair and will also continue as assistant to the chair of chemistry.

The preliminary movements have been made toward starting a college journal, the columns of which shall be devoted to local matters of interest to the School of Pharmacy. The various members of the faculty will contribute to the periodical, which will be issued weekly. It has not yet been determined who will act as editor-in-chief of the new publication.

There seems to be a unanimity of opinion among local retailers that business is picking up rapidly. Most of the down-town druggists are buying quite liberally at present and commercial tourists report their sales as much improved. The largest dealers in sundry novelties are laying in large stocks, and matters are again assuming their time-honored shape. Apropos of the present state of business it may be stated that there have been comparatively few failures in this city. The traveling representatives of the local wholesale houses report increased sales and the force of itinerant vendors of drugs and sundries is much larger than one month ago. All the city salesmen representing drug houses and allied lines of trade aver that matters

are on the mend and this staid old town will soon be in line again as a rattling business burg.

It is quite the bustling junior partner of the Hale & Justis Company, talks of buying a bicycle.

Joseph Fuldner, the Avondale druggist, who has been seriously ill, is reported to be mending nicely.

Local druggists complain of a scarcity of sponges in this market. Rock Island sponges especially are very scarce.

F. A. Grossman, the well-known druggist at Cleves, O., is now studying medicine at the Ohio Medical College in this city.

William Simco, a popular resident of Mt. Adams, is now connected with the drug house of John C. Otis & Co., at Sixth and Vine streets.

Joe Lambert, the energetic druggist at McMillan street and Park avenue, Walnut Hills, now has one of the best stocked pharmacies on the hill.

Peter Herman, the Cedar Grove pharmacist, was one of the jurors in a big will case in the Common Pleas Court during the past week.

The outlook for a large attendance at the spring session at the College of Pharmacy is very flattering. Some radical changes regarding the course of study will likely be made.

John Keeshan, the druggist at Sixth and Walnut streets, is selling the old fixtures of his store at auction. The fixtures are made of walnut, but were painted white during the war.

Wilmot Hall, the guiding spirit of two of the leading down-town pharmacies, is still sojourning in the south. He was last heard of in Southern Mississippi. His health is rapidly improving.

Joseph Hall, who fills the dual role of druggist and storekeeper at the City Hospital, has asked the board of trustees for an increase of salary. The request will be acted upon in the near future.

There is considerable talk in local drug circles about a well-known pharmacist getting sold in the purchase of a drug store. "Tis said that he paid \$4,500 for a store the true value of which was not over \$1,800.

Otto Rauchfuss, of the Standard Drug Company, is a noted patron of art and music. One of his daughters, who is now in Europe, is one of the best vocalists in this city. She is now taking a course in Paris.

George Kyllus, the pharmacist at Liberty and Denman streets, has one of the most extensive libraries in the West End. George now spends his time reading instead of gazing on the over-the-Rhine blackboards.

Ed. Gray, the popular pharmacist at Fifth and Main streets, is having his store renovated, after which he expects to do some up-to-date remodeling. A new soda fountain will adorn the front of the store.

Dr. E. A. Chaten has removed his drug store, from Covington, Ky., to the corner of Pearl and Lawrence streets, this city. This corner is a time-honored location as there has been a drug store there since the late war.

All of the slot machines have been taken out of the drug stores in this city by order of Chief of Police Deitsch. This knocks the envelope and stamp machine in the head and gives more labor to the now overworked clerks.

Dr. John M. Studder, the aged physician who died in this city a few days ago, was at one time actively identified with the drug business. The deceased left quite an extensive estate.

It is said that W. A. Tyrne, the Clifton druggist, who is one of the youngest pharmacists in this "neck of the woods," contemplates matrimony. The bride is said to be one of Mayaville's, Ky., fair daughters.

The host of friends of Edward P. Dehner, the druggist at Seventh and Vine streets, are urging him to make the race for Police Commissioner. It is thought he stands a good show of landing under the wire first.

Albert Melnitzer, the Cumminsville druggist, will have a beautiful place of business when his new store is completed. The fixtures are of the most modern pattern and cost something in the neighborhood of \$6,500.

Harry Watson, the popular clerk in M. F. Keeshan's Walnut Hill pharmacy, was seriously injured one day by the explosion of a bottle of creosote. Watson's hands and face were burned, but fortunately he will not be disfigured.

There is some talk of a new drug store on Price Hill, and Madame Rumor has it that the owner of the establishment will be one of the most prominent down-town pharmacists. The store will be located on the new electric street railroad.

Billy Salt, a well-known drug clerk, is again to be seen behind the prescription counter at Evans' Pharmacy, corner Fifth and Walnut streets. He was in the railroad business for a short period, but concluded to stick to his first love-making pills.

Frank Meyers, the druggist at Central avenue and Everett street, has just purchased a nice horse and buggy. He says he can get to his store from his home in Mt. Auburn now in ten minutes, while it used to take him a half hour by the street car.

Dr. Charles F. Woche, the druggist at Seventh and Main streets, is an avowed candidate for coroner on the Republican ticket at the next convention. Incidentally it may be stated that Dr. John C. Otis, who stands "aces up" at the Young Men's Blaine Club, would make a good coroner.

Dr. Louis Sauer, the physician-druggist at Baymiller street and Central avenue, now sports a lovely set of atmospheric-disturbing whiskers. The doctor is very popular in his ward and has often been asked to run for various offices, but he says he is contented to confine himself exclusively to his business interests.

During the past few weeks a number of our pharmacists have been lending helping hands to suffering humanity by filling prescriptions free of charge for the unemployed and the willing workers. As most of these people are procuring work from the city, however, this charitable practice will soon be uncalled for.

The Stein-Vogeler Drug Company has been granted a contract for furnishing the City Hospital capsules for the next six months. Contracts for other supplies have also been let to a number of other leading firms in this city. The outcome of the Howell-Turner scandal is being watched closely by druggists all over the city and the pestle jammers naturally take quite an interest in this institution.

CLEVELAND.

Cleveland, O., March 9.—The love feast of the C. P. A. on February 20, which, owing to its programmed en famille character, was given merely casual mention in the preceding issue of the Era, was such a hilarious affair that even the sparrows about the precincts of the Forest City house were intoxicated with the spirit of the occasion. Louis Hopp's verbruederungsdeie was given a baptismal reception which will not soon be forgotten and never forgiven by those who incidentally fell victims to insidious temptations. They say there is no joy complete without woman. Sentimental bosh! The pharmacists in stag social assembled got along "swimmingly" without the froufrou of evening dresses; in fact, they got along better in every way, ceremoniously and unceremonially. In planning this banquet demasque—tbis is Lenten for the other word—Mr. Hopp was diplomatic in every particular. He made allowances for a spontaneous eruption of mirth and fun chastened and chained by hard times abnegation; for a speedy assimilation of the estranged guests with the accompanying bouting features; for effects and after effects and after-the-ball-is-over contingencies. Thus, the better halves were necessarily voted to stay at home and retire early, to put the clock back six hours and be prepared "along between dusk and dawn" for Samaritan exigency. In the last number of the Era the number of guests was given at about two score. It should have been three score, as about thirty decided against their previous decision at the eleventh hour. The menu embodied Billy Akers' best epicurean efforts; there was no regular wine and liquor list appended, the druggists modestly reserving such matters for extempore arrangement. The most luscious part of the menu was the toasts. Whoever arranged them could serve as imperial court clown without rehearsals. Bogus telegrams were read from the country's upper servants. One such on a sending blank was from Grover Cleveland, reading: "With profound sorrow I am grieved to send my regrets. I am confined to the house with a swelled neck. Mr. Schellentrager will speak in my behalf." E. A. was thunderstruck, for he wasn't "on."

PHARMABANQUET BURRETTAS,
KEYHOLE GLIMPSES.

Ralph Cobb's strong will power apparent; blush of excitement on cheek, but immaculate shirt front at 2 a. m.

D. E. Steuer, tongue-tied about 1 a. m.; looks as if suppressing some violent emotion; also smitten with hicough.

Wm. Bodebender was greeted by first wake rooster; barked at by sundry dogs; directed home by milkman's route.

H. H. Flandermeyer will report for duty as some future date; is fasting now to reconcile his religious proclivities.

H. W. Stecher, advertising for lost latchkey; said to have asked a street lantern for a light on his way home.

Lou Hopp was the lion of the evening, a limpish, sleepy-eyed kitten after 12 p. m. His intrigue had come home to roost.

Eugene R. Selzer was not compelled to sleep in the woodshed; parlor sofa good enough for him; sent for a new hat in the morning.

Fred. L. Gegelein claims rescuing fatigued brethren from under the table; sending a second-hand clothing dealer to

several members next day; no valuables lost (a druggist is legalized to caution).

C. W. Benfield, a jolly good fellow; left his profanity bottled up in laboratory; but exploded with vehemence in the morning.

J. W. Deutsch, seemingly proud of his Irish name, for he proposed innumerable red-eye nightcaps; reported down with grip on 21st.

W. H. Frieseman came doctored for the occasion and finds wines a pleasant antidote, but the alloying process upsets his calculations entirely.

G. L. Hechler gave the owl car conductor a dollar to wink the other eye; both coats tails intact; wore hotel napkin when dinner discussed by his spouse.

John Lehr discarded all Lenten reserve; disporting as the German kirmess; cried, "bier hier, oder ich fall um," but fell before beer reached him; not fatal.

Philip Lehr tipped the waiter after each course like "ze haute noblesse," then had to borrow a nickel for car fare; apparently mild case, but two stout, will-powered legs.

Edo. Claassen—February 21 doctor's bulletin: Slowly convalescing; called for brandy and soda; 6 p. m. February 21, found in cellar alongside case of beer; hopeless case.

Thos. E. Sords ate as though Lent was only for poor people; claims he slipped on a banana peel when he tobogganed down stairs; got home without being ticketed through.

G. W. Voss, the cynosure of the German-American brethren while the pokals chased each other fast and furious; compassionately smiled at later. Got home all right on the 21st.

Daniel Myers denies going to bed with his boots on; says a number of the fraternity had to be put to bed by the hotel people, while he sobered up running after street car going home.

Carl Krebs thinks he can sing but can't; may succeed in oratory with wine-whetted courage; was extremely schmolli and dufzfreundlich when starting on his round-about homeward journey.

J. J. Riegelhaupt, amusing little cuss; malicious at discomfiture of others; entered his drug store on way home for medicated nightcap, and was almost arrested for house-breaking.

Charley Godman imbibes after each toast, milk, butter, dry, and drink toast, before, and during them, but a jury could not decide whether intoxicants; may be only stimulating; denies taking a quiet sneak.

E. A. Schellentrager, ein urgemetliches haus, burschikos up to midnight; philistroses a little after; Katzenjaemmerlich anzusehen about 3 a. m.; haeringungschlugen little after, then fortified to see it out.

Fred W. Stecher says he was not guilty; when thoroughly initiated and about to depart asks bell-boy where he is at, however; becomes suddenly color blind and mistakes street car, and lands about eight miles from home.

Henry Eechberger, devilish sly behavior; careful of his dignity; sips nonchalantly, but gets there; extremely attentive to every pop, then quickly draining his glass; never refuses; disappears suddenly; no farther news.

George R. Robinson laughs himself into fits over the boiling fun; signs of early dissolution; anxious to introduce monthly banquet features, illuminated by a quar-

terly "whopper," but the proposition strikes a snag in his throat.

John Gleim eats sparingly of salted entrees only; gets outside of \$5 worth of wet goods, seemingly; very pallid at midnight; mumbles and murmurs and scares the chambermaid and two bell-boys; steps on other man's corn, breaks a pane of glass and falls asleep in a hack; no news from home.

Frank C. Oster can eat hoghead cheese, steamed prunes, chicken salad and suspicious hash all in one; stomach of giant; not particular as to order of menu; could start with ice cream with beer washdown, liquor top-off, punch chaser; no secrets divulged at home, so is really hero of occasion.

Arthur F. May looks as if he had been there before; chipper and dapper as a major, but little top-heavy; called for spatula when ice cream was served; other absent-minded symptoms such as wearing other man's hat, suspicious odor on return from certain place; found keyhole when assisted by passer-by.

Frank S. Carroll held on, literally and figuratively; did not eat ice cream with his knife; pocketed not more than six oranges for wife or someone dear; did not tell lies, only a gross untruth when said sober as a judge, but did not budge into every hallway at the approach of a patrol or undertaker's wagon.

George R. Hoehn behaves as a Y. M. C. A. member should; seemingly ill at ease among such worldly proceedings, and exchanges ocular conversation with partner Schellentrager which, interpreted by Dan Myers, means: "E. A. you schwerenoether, you brought me into this; the punishment will fall on you; oh, mamma, forgive your erring son."

To individualize farther actions on, before and after the banquet seems preposterous; to itemize them would be grotesque. Suffice it to say in conclusion that every attendant guest contributed his mite of fun, the mites being abnormally unequal, of course. That the reunion was a well-rounded success, in every way conducive to good-fellowship and closer approach in a social and business way; that many patres familias absented themselves early and in "good shape," as behooves devout husbands and fathers, especially during Lent; that whoever stayed it out did so from unselfish motives; that whoever attended did so through a commendable, laudable sense of fraternal union, with a view to generalize intercourse, improve opportunities, abjure clannishness and retire hard times moods, ennui and pique for the nonce at least. The C. P. A. in special committee assembled, interdicts reproduction of the banquet incidentals; it also cautions laymen against reading them. They are by and for C. P. A. folk exclusively.

Toledo Licorice Works, Toledo, burned. Loss \$20,000; fully insured.

Beidler's drug store at Canton was raided by burglars recently.

O. W. Hogue, formerly a druggist at Garretttsville, more recently of Ashtabula, died of consumption.

The assigned assets of the Dietrichs Oil Co. have been ordered sold by the Probate Court upon a request of the creditors.

Dr. Howard A. Kelley, of Johns Hopkins University, delivered an address before the Cleveland Medical Society March 9th.

By a decision of the circuit court the Goheen Paint Co. of Canton, is to be dissolved.

The Benedict Medicine Co., of Norwalk, are making a great splash with their "Itogo" remedy.

John Spear, of Lima, president of the Shawnee Oil Co., died suddenly at Bryant, Ind., aged 65.

The American Medical and Surgical Society of Ohio is a recent corporation. Origin, Cincinnati.

The Palmer Bros. Co., of 121 Water street, are doing quite well with their drug trade specialties.

E. W. Emde, a drug clerk, has been fined heavily and sent to the workhouse for abusing another man's horse.

Dr. W. T. Corlett will be the local representative at the International Medical convention, in session at Rome, Italy, March 5 to April 5.

The president of the Ohio Liquor Leagues claims to have the assurance of every legislator that no liquor legislation will be enacted at the present session.

The Dayton Labeling Machine Co., Dayton, capital stock \$25,000, incorporated. Like the Hiles Slanting Spout Co., of this city, they claim to fill a long-felt want.

Owing to the presence of smallpox in several Ohio towns the local sanitary office proposes to subject the inmates of boarding, lodging and apartment houses and hotels to vaccination.

A shabby-looking fellow, with a superabundance of hard times nerve, obtained \$25 worth of drugs from Heller & Gouvy upon an order to which a hospital doctor's name had been forged.

Senator Brown's vinegar bill, now before the legislature, prohibits, under heavy penalties, the use of lead and copper, and sulphuric and other mineral acids and their compounds heretofore employed in coloring.

Hon. Louis P. Ohliger, the Wooster druggist, is making many friends in this city through his connection with the Internal Revenue Department as chief. Mr. Ohliger has been identified with the Ohio drug trade for over forty years.

Members of the Royal Arcanum at Oberlin caused the arrest of druggist J. M. Gardner on the charge of murdering Noah Huckins for the sake of obtaining the insurance on his life, and subjected him to a public trial. The whole affair was a mockery, yet it caused a widespread sensation.

The dull times has decided several retailers to sell, but buyers seem to be scarce. Would-be proprietors are holding back for want of confidence in the future, and speculation buyers demand too many concessions and sacrifices. Sommers' pharmacy, on Pearl street, is among the offerings.

E. A. Schweninger celebrated his 44th birthday anniversary February 22. His family had been on the quill vive for the event and agreeably surprised him with a patriotic gift—a fine sliver flag to henceforth float over his Glenview retreat. In the evening a number of friends were entertained at luncheon.

Some time ago W. F. Joy, then a member of the Glidden & Joy Varnish Co., of this city, sued in a claim against the company for \$20,000, allegedly due him as profit and salary. The company, which has since changed its name to the Glidden Varnish Co., lost the case and on March 2 filed a petition in error in the Supreme Court.

PITTSBURGH.

Pittsburgh, March 10. One of the chief subjects of discussion in local drug circles just now is the complications which have arisen over the troubles of the Cuticura soap people in trying to squelch their competitors, or rather, their imitators. For some time there has been on sale a close imitation of Cuticura here, known as "Curative" soap. It is understood to be made in Lancaster, Pa., by the same firm which manufactures "Buttermilk" soap. It sells for about \$9 a gross to the trade, and is a close imitation of its established competitor in the boxes, wrapping and coloring, and with nine out of every ten buyers would be mistaken for the original article. The reports of buyers brought consternation to retail sellers, who could not understand why or how they were being so fearfully outsold. The new product was sold by the cut-rate people for ten cents a cake, or three for a quarter. The manufacturers of Cuticura soon heard of the interlopers, and secured an injunction against the Lancaster manufacturers and all dealers in the state. Printed copies of the court decision and circulars have been scattered broadcast through this region, and the new article has been withdrawn from sale, at least so far as can be learned. The retail dealers in the original soap are also making a complaint on the ground that there is nothing in it for them. When the department stores and other cut-rate dealers knocked the bottom out of prices many retailers quit handling it, but now the price has been raised 10 per cent; but it does not seem to benefit the retailers, and although they have largely taken up the sale again, it may decline. It is claimed the only benefit of the new prices accrues to the jobbers.

The Wholesalers' Association held their regular weekly meeting on the 19th inst. Their sessions are largely devoted to local trade matters, but the proposed change by Congress in the tax on whiskey was discussed at considerable length. A member of the firm of W. J. Gilmore & Co., wholesale dealers in drugs and liquors, said: "We have taken no definite action, because no one seems to know 'where he is at.' So far as known here, the matter in the United States Senate is yet unsettled, but the impression is that the internal revenue tax will be increased to \$1.20, or thirty cents more than is now being paid, with the increased bonded period also provided for. It receives opposition for one reason at least, which is that it requires so much more money to carry the same amount of goods. At any rate, dealers here are buying heavily in anticipation of the increase going into effect. The Pittsburgh district is largely interested from the fact that, excepting Kentucky, it is the largest producing region in the country."

The Pittsburgh Paint and Drug Club held their monthly meeting and dinner at the Hotel Duquesne on Friday, February 16, M. B. Suydam presiding. C. F. Welis, Jr., A. C. Henderson and W. J. Gilmore were appointed a committee on nominations. They will report at the next meeting, when officers for the ensuing year will be elected.

James F. Goldaine is successor to James Kerr, Jr., at the corner of Smithfield and Sixth avenue, he having bought out Mr. Kerr. The latter gentleman was closed

up by the sheriff about the holidays, but made an arrangement with his creditors whereby he was enabled to resume. Later he went out of business again, and has not yet re-located. Mr. Goldaine is a Connecticut man by birth, but was associated with Mr. Kerr for eight years. He is eminently qualified for the new position, and has begun well by providing several improvements, which make his place more attractive. He put in some large plate-glass display windows and changed the name of the establishment to the "People's Pharmacy."

Lynn B. Hughes, of the drug firm of Rankin & Hughes, 5100 Penn avenue, is among the recent victims of small-pox in this city. He was taken to the municipal hospital and is recovering rapidly as his case was not malignant. Three other cases were reported a week ago. The cases are all quarantined.

The A. C. Henderson Drug Co. are erecting a new five-story brick building on Seventh avenue, Pittsburgh, to replace the structure that was burned. The contract calls for the block to be finished by March 1, but it is not likely that it will be done by that date. The firm are managing to occupy a part of the first story but are in very cramped quarters. They have a frontage of 24½ feet on Seventh avenue.

Dr. C. N. Van Sickle, of Oakdale, was tried before Judge Ewing on the 20th inst. for violating the pharmacy law in compounding medicines without being a registered pharmacist. The prosecutor was Louis Emanuel, the Second avenue druggist, representing the State pharmaceutical board. The evidence was that the doctor and his wife own drug stores at Oakdale and Munhall and manage them without the certificate from the board which the law requires. Dr. Van Sickle's defense was that his wife owns the drug stores and he only compounded medicines prescribed by himself.

In his charge to the jury Judge Ewing tore the pharmacy act to pieces and said he did not believe it was constitutional. It was not, he said, designed so much to protect the public as it was to protect druggists and to create a monopoly in the drug business. He pointed out the inconsistencies of the act, one of which is that while it creates an examining board to pass upon the qualifications of applicants for certificates as pharmacists, it does not say what the qualifications of the examiners shall be. Under it a person who knows nothing of pharmacy or chemistry would be competent to act as an examiner. By a literal reading of the act doctors would be prohibited mixing the medicine they give their patients, something that is done by them every day.

The jury did not require much time to consider the case. Dr. Van Sickle was found not guilty, but ordered to pay the costs. This verdict was rendered because the law as it stands is against the doctor and because the prosecutor was acting in his official capacity when he brought the suit. After the jury had retired Judge Ewing and Mr. Emanuel held a long talk on the act and the judge still held to the opinion that it is unconstitutional and not framed as it might be for the protection of the public against incompetent pharmacists. Mrs. M. E. Van Sickle, the doctor's wife, will be tried for managing a drug store without having a registered manager's certificate.

CORRESPONDENCE.

NO CAUSE FOR ALARM.

Chicago, March 5, 1894.

To the Editor:

The reply of Prof. F. M. Goodman, dean of the Chicago College of Pharmacy, to Mr. Nicholas H. Martin's comments upon certain aspects of pharmaceutical affairs in America betrays such uneasiness lest some one should imagine that he, Mr. Martin, really meant to poke fun at the college which Prof. Goodman so ably represents, that I am moved to assure him that there is no cause for alarm.

Prof. Goodman evidently thinks that if he should fail to convince his readers that the quotation he quotes from Mr. Martin's address was directed against Illinois College of Pharmacy, then said readers would have no alternative but to conclude that Chicago College must be the target, especially as Prof. Goodman readily recognized that at least some of the pictures drawn by Mr. Martin do resemble the features of that school. He experiences no difficulty in demonstrating to his own satisfaction that Illinois College of Pharmacy must be the college referred to in one quotation given by Mr. Martin, and at the same time that Mr. Martin received his inspiration from the dean of that institution itself. That these two propositions are rather inconsistent with each other does not seem to have occurred to the professor.

The quotation mentioned as given by Prof. Goodman is as follows: "Crude and raw students with as little as fifteen months' practical experience, and being under age, having been granted diplomas. The dean (sic) of one college claimed that every American college is doing the same thing."

Then Prof. Goodman declares: "As a heritage from our great forefather we cannot tell a lie." And when the gentleman (Mr. Martin) speaks of pharmaceutical journals admitting the existence of the evil, although some of them hedged, but that it was mentioned as a significant fact that those journals were the organs of the college (Here Prof. Goodman's pen refused to add the letter s to complete the word "colleges" used in Mr. Martin's quotation) complained of, he brings things down to a fine point, for there is but one college of pharmacy in Chicago which publishes its own organ."

Prof. Goodman, dean of the Chicago College of Pharmacy, indignantly exclaims: "Does Mr. Martin really believe that every American college is doing the same thing because one disgruntled dean told him so? He evidently fell in with the wrong dean to get correct information. If Mr. Martin had called upon the dean of this college (Prof. Goodman himself) instead of being taken in by the dean of some other college, etc., etc."

Now, really, if Mr. Martin did not fall in with Prof. Goodman, that fact alone does not seem to justify Prof. Goodman in falling out with Mr. Martin.

But I hasten to relieve Prof. Goodman's mind. I am quite confident that Mr. Martin is firmly convinced that if there is anything under the sun of which every American college is absolutely innocent,

they are certainly innocent of "doing the same thing." So far as the colleges of pharmacy are concerned they are with all their might and main doing things as differently as possible. Furthermore, the conclusion that Mr. Martin's quotation referred to some Chicago college is not unavoidable, as there is no indication whatever, directly or indirectly, connecting it with Chicago; nor does it follow because Mr. Martin did not call upon the dean of the Chicago College of Pharmacy that he must have been "taken in by the wrong dean." Finally, there is internal evidence in Mr. Martin's own address, as published in the Era of January 15th, which points strongly to the conclusion that he did not obtain his information from any kind of a dean. The internal evidence to which I would refer Prof. Goodman is Mr. Martin's own plain and direct statement, which the professor seems to have overlooked, but which shows that some state board report had said that somebody else said what Prof. Goodman says that Mr. Martin said. Here are Mr. Martin's words in his own way: "I quote the following from a report of a state board of pharmacy." Then follow the quotations from said report containing a reference by the reporters to some "correspondence with the Conference of Teaching Colleges of Pharmacy of the United States, in which are pointed out specific instances of laxity, such as crude and raw students with as little as fifteen months' practical experience, etc."

Everyone acquainted with American pharmaceutical events will see that Mr. Martin had the ill fortune to be "taken in" by a report dealing largely in reminiscences, for the Conference of Teaching Colleges of Pharmacy ceased to exist in the year 1885, and the particular college which furnished the text for the correspondence referred to, has also been extinct, so these many years. And as to the two colleges at Chicago, the Illinois College of Pharmacy was born in 1896, and while Prof. Goodman might argue that this "brings things down to a fine point," for prior to 1885 there was "but one college of pharmacy in Chicago which published its own organ." I am glad to be in a position, having been the dean of that college and editor of its organ at that time, to testify that the Chicago College of Pharmacy was then entirely innocent of "doing the same thing." Prof. Goodman, of course, is able to speak for it now. And as I am writing this partly to relieve Prof. Goodman's honest solicitude about the good repute of his neighbor, I will add, officially, that the requirements for graduation in Illinois College of Pharmacy are explicitly stated in its catalogue and have not been deviated from.

Prof. Goodman's selection of a text for himself is admirable: "O, wad some Pow'r the gittie gie us to see oursels as ithers see us!" If the choice was made in his official capacity he could not have succeeded better.

Had Mr. Martin done me the honor to consult "the wrong dean" I should have done my best to convince him that the peculiarities he had noticed in the American pharmaceutical world do not truly represent the status of our craft any more than the Canadian thistle represents our vegetation.

OSCAR OLDENBERG.

A PROTEST FROM MR. HOGAN.

To the Editor:

My attention has just been called to an editorial in your issue of February 15th, commenting on the troubles of the pharmacists at this end of the city with the saloon keepers' association. You not only cast unjust reflection upon us, but show a lamentable ignorance of the facts wholly inexcusable, as your correspondence could have obtained the facts just as easily as to use the garbled newspaper statements.

Your advice is all right, but we understand the laws here and the conditions we have to meet perhaps as well as you. We may not be as holy as thou, or as your correspondent, but when it comes to allegiance to the laws of the land, I think we will average up with the balance of our fellowmen.

Now for the facts: We have in Englewood, a strip about three miles long and one mile wide, which is known as the "Prohibited District." Trade has been dull with the saloon men on the borders, and some of them thought the druggists were hurting their business. They held a meeting, appointed a committee, hired a sleuth, presented their case to the powers that be, the city government furnished another sleuth and the two creatures started after evidence.

Now as to the conditions: We have a state law requiring a license fee of \$50 for the sale of intoxicants, also granting municipal authorities the power to grant permits to druggists to sell for medicinal, mechanical and sacramental purposes. The city government recognized this law by issuing permits requiring registration of all sales. We all have the permit and the book of registration. All the requirements are carried out fully.

You seem to have selected me as a "bright and shining light"—save the mark—because a member of the State Board of Pharmacy was "pulled" with the others. The charge made in the warrants was selling spirituous liquors in quantity less than a gallon, without a license.

The saloon men claim this is a prohibited district, and that the city has no right to issue permits, yet they go outside the prohibited district and arrest all in the Town of Lake (old town).

As you have called particular attention to me, I wish to make a statement showing the evidence. One of the city attorneys was assisting the saloon attorney. A young man swore that he bought two ounces of brandy of me, no questions asked. The sale was registered, name and address of purchaser. Did I not comply with the law? I was fined with the others.

Another case: A. C. Musselwhite. The sale was registered and Mr. M. had two witnesses to prove the registration, yet he was fined. In view of your advice to register all sales, what have you to say on the law and the evidence?

Perhaps you can tell why the churches of this end of the city are impugning our association to join them in an attack on the saloon element.

Perhaps you can tell why the majority of the saloons on the borders declare this raid on the druggists an outrage.

Perhaps you can tell why sixty-five warrants sworn out against druggists in Hyde Park were not served.

Perhaps you can tell why warrants were sworn out against sign boards.

name on the skin having been out of business two years.

Perhaps you can tell why the warrants were given to a constable who could not read United States, and who handed the bunch of warrants to the victim and allowed him (the victim) to pick out his own warrant. We have the people and the churches with us, and they are ready to "put up" for a fight. The devil is against us in the saloon keepers, the brewers (who want to break down the prohibition district), the city government, for what reason we do not know just now. We have banded together for a fight to a finish, and propose to get some information and send some fellows in the direction of Joliet.

Perhaps you have some more timely advice to give us.

Very truly,

L. C. HOGAN.

Chicago, February 24, 1894.

PRACTICAL WORK AT PURDUE.

To the Editor:—The article in the February 15 number of the Era concerning practical examinations by boards of pharmacy leads me to say a few words for my alma mater. The work in Purdue School of Pharmacy has become intensely practical in every department. Indeed the object is to give the student not only a good idea of the contents of text books used, but to make that knowledge so thorough and practical that he will be competent to satisfactorily fill any position, whether he has had previous experience or not. Especially is this apparent in the dispensing laboratory. The student is drilled thoroughly in everything pertaining to this department. He receives the prescription over the counter, reads, fills, labels and wraps just as he would in a first-class pharmacy. His work is inspected by a competent instructor, who makes such corrections and suggestions as are necessary.

The examination questions by the board of the State Pharmaceutical Association are such as will test the student's practical knowledge of the subjects treated. Not only are these examinations written, but they also require test work in the dispensing laboratory. Indiana has a school of pharmacy of which she may feel proud. One which, though young, stands in the front ranks with other schools of its kind. One where young men and women are fitted to occupy responsible positions with honor to themselves and their alma mater. I am much pleased with the examination questions presented in recent numbers of your magazine. They will be of infinite value to drug clerks everywhere. We need something of the kind to keep us refreshed and up to the times. For who does not become rusty in this grand, ever interesting and progressive work. I hope you will continue the publication of these questions. Make them very practical. This is an age where theory is thrown to the four winds. "Is it practicable" is the question. Then let us have only that which is practicable.

J. R. MUTZ, Edinburg, Ind.

WINDOW DISPLAY.

To the Editor:

I wish to describe an apparatus I have in my show window which is attracting a great deal of attention. It is an immense pair of home-made scales made of

wood and pasteboard, glued, and suspended from the ceiling. On one pan I have whatever merchandise I wish to advertise; in the other pan I have an eight-ounce bottle, placed in the side about half way up, with a rubber syphon tightly fitted in the hole. On a shelf near the window I have a 5-gallon can filled with water which runs through a rubber tube into the mouth of the bottle on the scale pan.

The scales are so balanced that when the bottle is empty that side is up. The water flows continually from the 5-gallon can into the bottle, and soon makes it heavy enough to go down. If the scales are properly balanced, by the time the bottle has reached bottom, it is over half full, i. e., the water is above the highest point of the syphon, and of course that starts the syphon. This syphon is made of tubing twice the caliber of the supply pipe. It tightens the bottle and allows it to go up again until the bottle is emptied, when the syphon stops and will not start again until the bottle is over half full of water and down.

If the weights on the scale pan are so adjusted that the bottle does not reach its lowest point of descension till it is half full of water and the syphon just started, nor its highest point of ascension till the syphon has stopped and the bottle empty, the motion will be continuous.

With a 5-gallon reservoir and nursing bottle tubing as a supply pipe, the apparatus will run several hours. The syphon in the bottle must be at least twice the caliber of the supply pipe.

The hole in the bottle is made with a file dipped in turpentine, a tedious but not difficult operation. I made a carbonic acid see-saw from the description in the Era, with an addition of my own, which allowed the gas, as it escaped, to bubble through water contained in a wide-mouth bottle, sitting in front of the see-saw.

GEORGE H. GOULD,
Louisville, Ky.

A NEW PLAN.

To the Editor:

Seeing in the Era of March 1st an article headed "One Way to Protect Retail Drugists." I would say that I do not think the wholesale druggist wholly responsible for the patent medicines sold to grocers. A good many are not handled by druggists, but are put up by quacks and put into groceries on commission. Although for the staple patents the wholesalers are responsible. The grocers selling patents are supplied through their jobber, who buys them from the wholesale druggist. If this were stopped and the following plan adopted I think a great deal of the present trouble could be corrected:

If druggists would stop making sarsaparillas, cough cures, nerve tonics, etc., the manufacturer would stop selling direct to the "cutter." Why? Because the druggist making the above preparations recommends them in preference to the article on the market, the sale of which is thereby decreased. Now, the wholesaler is prohibited from selling to the "cutter" by the retailer's kicking, and as the retailer won't sell the article on the market because he recommends his own, what is the manufacturer going to do? Shut up shop? I guess not. He will supply all the "cutters" that will sell his goods. Hence the cutter. In the first place, if we had a law prohibiting the manufacture of patents which could not

stand a thorough examination and test by a state medical or pharmaceutical examiner, on the same principle as our U. S. Patent Office, it would diminish the amount of patents on the market, decrease the amount of dead patent medicine stock, and, last but not least, decrease "cutting" and give the doctors a show, and thus increase prescription trade.

Yours respectfully,

WM. H. MARTNER,
Mgr Liebig Pharmacy, Detroit.

PACIFIC COAST NOTES.

The Padena Drug Co. will occupy a handsome new store in the Hotel Grand block at Pasadena.

The Utica Mining Company is building a hospital at Angels, Cal., for the use and benefit of the employes of the company.

Adolf Ekstein, a Los Angeles druggist, has recently moved into an elegant store in the Bradbury block. It is said to be the finest drug store in Southern California.

The California Steam Navigation Company, plying between San Francisco and points reached by the rivers, have adopted a plan of carrying a drug store on board for the use of the passengers.

Wm. C. Spencer, of San Francisco, has made an application to the Superior Court, for a decree adjudging F. A. Weck guilty of fraud in having misappropriated about \$6,000 of the funds of the drug company.

M. W. Heinrich, proprietor of the Pacific Pharmacy at Eureka, Cal., was married at Arcata a few days ago to Miss Annette Minnick, who arrived here from the east a day or two before the ceremony.

Will Liteheld, of Pasadena, has been employed by the wholesale drug firm of F. W. Braun & Co., of Los Angeles. Paul Derfe, a graduate of the Chicago College of Pharmacy, succeeds Mr. Liteheld with Chas. E. Weck, of Pasadena.

Mrs. Larson, wife of the steward at the Receiving Hospital in San Francisco, went into the drug store at the hospital a few days ago and by mistake took a dose of corrosive sublimate, intending to get a dose of chloral. The physicians were unable to save her life.

The San Bernardino Courier claims that drug stores in that county are reaping the benefits from the high saloon license. It claims that a thriving liquor trade is being done by the drug stores, but is not such an extent as prevailed a few weeks ago. At that time one of the clerks was convicted and fined \$100 for selling liquor at retail.

Dr. A. A. Clarke, who for several years past was employed in Caldwell's drug store at Biggs, Cal., has been arrested in Tombstone, Ariz., on the charge of bigamy. It seems that Mrs. Clarke never one, who had been living at Minneapolis, appeared upon the scene, greatly to the chagrin of the doctor as well as to his present wife, who is said to be an estimable lady.

R. L. Reid, a Tulare druggist, appeared before the supervisors of Tulare county to ask for advice concerning the payment of a retail liquor license. He claims to keep liquor only for prescriptions and his sales do not justify him in paying his license exacted for retail liquor. The prevalent opinion is that Mr. Reid could not be required to pay the retail liquor license, but a druggist's license only.

PHARMACEUTICAL ASSOCIATIONS.

MORTAR AND PESTLE CLUB OF RHODE ISLAND

The first annual meeting was held in Providence on Wednesday, February 14, at No. 218 Weybossett street, President A. O. Hull in the chair. A lively interest was evidenced by a good attendance representing all sections of the state. Following the reading of minutes of the January meeting the president's address was read. An abstract of this address follows:

"The words organization, organization, published in very bold type in The Pharmaceutical Era a little more than one year ago by Mr. Frick, secretary of the Inter-State Retail Druggists' League, attracted my attention. I resolved to correspond with Mr. Frick, who gave me very willingly and encouragingly all the information necessary regarding organization, and all the benefits to be derived, locally and nationally. Acting upon Mr. Frick's advice, I conceived the idea of enlarging the Mortar and Pestle Club and into a State Organ as a branch of said League. The Mortar and Pestle Club of Rhode Island was launched into existence on the 1st of January. Several meetings were made personally to get an expression of the druggists or rather to wake them up to the urgent necessity of an efficient and united course of action in a very demoralized condition, into which we had been slowly but surely driven, in trying to hold our trade from drifting into other channels, but to no avail. After interviewing a few intimate and warm personal friends in the trade, a call was made for a meeting on the above date and was responded to by a mere handful of druggists, but who have since proved very earnest and sincere in their endeavor to make a grand struggle to better the conditions of pharmacists of this vicinity. I felt very much disappointed to find that so few were sufficiently interested and realized that I had undertaken quite a contract to organize the trade of this state. But with the aid of ten willing workers I have pushed on until the club at present has a paid-up membership of over 90 per cent of the retail druggists of this state. I feel that we have been remarkably successful considering that our druggists are scattered all over the state, requiring a great amount of patience and persistency to obtain the percentage we have at the present time. I am also very grateful to our very efficient traveling salesmen for their hearty co-operation.

(He then followed with various recommendations: That a grievance committee be appointed, that the constitution be revised, and that the wholesale druggists be petitioned not to sell at wholesale prices to any but recognized dealers.—Ed.)

"I would suggest or ask that each and every member of this club and in fact every druggist in this state, who are manufacturers of proprietary goods, request such manufacturers to place their products upon the league contract plan, and that some perfect system be adopted for identification marks' upon such goods, if they have not already done so, that it may be possible to trace their goods to the consumer, and guarantee them your hearty support, when such a system has been adopted, preferring to have dealings with only those manufacturers who have a system of protection that protects.

"I would also recommend that a committee on commercial interests be instructed to correspond with influential pharmacists in the larger cities of such of the New England states as have not yet taken steps towards organization.

"Aside from the main point of interest, we have in the past year been earnestly working for the druggists at large, namely, for improvement in the profits in our proprietary departments. Locally, we should use our united strength to obtain greater improvements in our state pharmacy laws, and are considering that most of our earnest workers to be too ancient or crude to be of service in this advanced stage of pharmacy. The method of which the members of our Union of Pharmacy are appointed are entirely unsatisfactory. The examinations are not of that practical standing which is required to insure the competency of the candidate who has the certificate of reg-

istration guaranteeing him to be proficient in his selling. The pharmacist who (as is quite frequently the case) employs a clerk with only the state registration certificate, finds it is not backed by its holder.

"I repeat, organization first, and by organization many desired necessities can be obtained. We have in the Inter-national Association with a constitution that is all we can ask for, to carry out the plans upon which we have been at work for the past year. I feel assured that in a comparatively short time there will be sufficient members to represent 80 per cent of the druggists of the greater number of our states, and numbers tell. Montreal in 1892 we had very little weight, but you will notice that at Detroit in 1893 our delegates were recognized. Their power was felt, we came very nearly getting the order of the day.

"Now in 1894 we will go before the annual conventions with our requests backed up by such overwhelming majorities that the retail druggists that they will gladly accede to our demands, the mutual benefits to be derived will be so apparent that the struggle will be lost in advance.

"Local organization is absolutely necessary that we may be prepared to send good and efficient men as delegates to the conventions.

"I hope that every one of our druggists feels the necessity of placing his name on our list to become a member of this club. Whether John Smith, Paul Jones, Chicago or New York or other supposed leaders sign or not, put your name first and make Little Rhody the first state in the union to complete her list. Do not wait, for as has been said of her before, her size is not determined by square feet but by heads."

Following the above address reports were made by financial secretary and treasurer, which showed a balance on hand and a very satisfactory financial condition in the club's affairs.

The election of officers for the ensuing year resulted in the choice of:

Albert O. Hull, of Central Falls, President.

Henry J. Alfreds, of Providence, vice-president.

Edgar K. Gridley, of Pawtucket, secretary.

Howard A. Pearce, of Providence, financial secretary and treasurer.

The president then announced the following committees:

On finance, Wm. E. Cates, of Providence; Chas. A. Glaney, of Pawtucket, and Frank A. Jackson, of Woonsocket.

On membership, H. L. Swindells, Manton; R. S. Soper, Providence, and R. F. Linton, Woonsocket.

On ways and means, Jas. A. Robinson, Pawtucket; Howard A. Pearce and E. A. Payne, Providence; Chas. F. Gladding, Warren.

John Metzger, Providence, scientific interests.

Jas. O'Hara, Providence, commercial interests.

Henry J. Alfreds, Providence, social interests.

A large number of members were added to the club's list at this meeting and a feeling of approval of its work in the interests of retailer is manifesting itself throughout the trade of the state. After adjournment a collation was served, and after cigars were lighted interesting and instructive remarks of a most practical and businesslike character were made by Pres. Canning, of the I. R. D. League; F. W. Reeves and Geo. W. Cobb, of the Apothecaries' Guild of Boston; and also a report was made by the club's delegates, I. M. Smith, H. J. Alfreds and E. K. Gridley, who were present at the I. R. D. League special convention held in New York on February 6.

Illinois Pharmaceutical Association meets at Peoria, August 14-16.

Pharmaceutical Associations have been formed at Fitchburg, Mass.; Lewiston, Me.; Salina, Kans.

New York State Pharmaceutical Association will hold its next annual meeting at Saratoga some time in June.

Denver Pharmaceutical Association held its annual meeting and banquet at the St. James Hotel in that city February 13.

Norfolk & Portsmouth Pharmaceutical Association has fitted up assembly room, reading room and library in Norfolk, Va., and is making a collection of rare drugs, chemicals, pharmaceuticals, etc., to which contributions are solicited. The secretary is J. W. Thomas, Jr., Norfolk.

Manitoba Pharmaceutical Association met in annual session at Wintnipeg February 21. Total membership 23. Papers were read and new members of the council elected. It was voted to present annually gold and silver medals for general proficiency in the major examinations.

Tennessee Pharmaceutical Association will meet in ninth annual session at Chattanooga, May 16th. The various committees promise interesting reports, and an effort will be started to extend the provisions of the pharmacy law to the smaller towns. Every druggist in towns now affected by the law is requested to attend and express his opinions. Secretary, Will Vickers, Murfreesboro.

Southern Association of Wholesale Druggists.—The postponed annual meeting was held in Memphis, Tenn., February 26, with a representative attendance. The usual routine business was transacted and in this respect and in amusement features the convention was a notable success. The association is accomplishing much in the way of harmony and unity in the trade.

The time of the annual meetings was fixed for the third week in February of each year—not earlier in the week than Tuesday. Atlanta was selected as the next place of meeting. The following officers were elected: P. P. Van Vleet, of Memphis, president; D. D. Phillips, of Nashville, first vice-president; M. A. Fall, of Atlanta, second vice-president; F. W. Schumacher, of Waco, Tex., third vice-president; A. G. Cassells, of Vicksburg, Miss., secretary; J. C. Lyons, of New Orleans, treasurer.

The following resolutions were adopted:

Resolved, That the association memorialize all manufacturers of proprietary goods (excluding pharmacutists) to incorporate in their contracts the arbitrary one-quarter dozen advance clause; also that forbidding the sale of their goods to cutters, except at retail prices.

Resolved, That the issuing of special lists at leading figures in full package quantities to retailers is against the interests of the wholesale drug trade, and that this association urges upon its members the discontinuance of same.

Resolved, That we reaffirm our confidence in the rebate plan as a thoroughly satisfactory method of maintaining uniform prices.

Resolved, That this association endeavor to demonstrate to the United States senate that the increased tax on alcohol as now provided by the Wilson bill as

passed the house, placing a duty of \$1 per proof gallon on this item, will prove very serious additional expense in the production of pharmaceutical and chemical preparations, and that is an onerous charge on the wholesale and retail druggists, as well as manufacturing pharmacologists and chemists; that the United States senate be urged to return the bill on the basis of 50 cents per proof gallon, as ruling heretofore.

BOARDS OF PHARMACY.

South Carolina Board of Pharmacy met at Charleston March 8 for examination of applicants for registration.

Maine Board of Pharmacy granted registration February 11 to Gridley R. Fogg, Skowhegan; George H. Kelley, Lubec; Wallace W. Dryson, Portland; Frank W. Hucnam, Yarmouth; W. H. Walker, Vinahaven; Alfred M. Ferguson, Belfast.

Georgia Board of Pharmacy met at Atlanta February 26. Of ten applicants for registration the following six were successful in passing the examination, viz.: O. B. Hartzog, Atlanta; R. C. Hood, Harmony Grove; L. C. Newman, Alabama; W. M. Caldwell, Chipley; H. T. Marsh, Jr., Savannah; H. K. Sipper, Atlanta.

Alabama Board of Pharmacy at its last meeting granted certificates to C. M. Howard, Tuskegee; Cuba W. Hunter, Montgomery; Eugene Whaley, Birmingham; C. P. West, Jr., Clayton; W. J. Galloway, Abbeville; T. D. Reed, Mobile; T. C. Freker, Mobile; E. E. Ravenscroft, Union Springs; E. T. Castleberry, Caladega. Next meeting at Anniston, May 17.

Michigan Board of Pharmacy held an examination in Grand Rapids March 5 and 7. The successful candidates were: Registered pharmacists—H. D. V. Altego, Bradley; J. Ball, Nashville; C. E. Bradshaw, Yale; Florence Burch, Adair; P. J. Depree, L. E. Jones, Robert Johnson, Grand Rapids; G. J. Menold, Luther; E. L. Moore, Melvin; J. C. McGregor, Ann Arbor; J. H. Scott, Carland; F. W. Welse, Saginaw.

Assistant pharmacists—C. J. Anderson, Manistee; L. D. Bates, Burnside; B. L. Beorrs, Carsonville; Corin Becantel, Wayland; R. J. Burrows, St. Ignace; Caleb Cowing, Henrietta; S. Cudlip, Marquette; A. W. Dickerson, Conklin; B. C. Fisk, Edwardsburg; E. J. Fletcher, Grand Rapids; C. E. Foster, Webberville; R. C. French, Diamonddale; A. E. Fuller, Richmond; G. G. Gardner, North Star; Robert Goodfellow, Clio; F. J. Green, Manistee; M. K. Greening, Quincy; R. C. Henderson, Millington; M. J. Hills, Grand Rapids; J. A. Hawson, Saginaw; T. P. Hull, W. E. Lefever, Muskegon; L. O. Loveland, Charlotte; W. B. Minthorn, Oscoda; D. W. Mitchell, Harrisville; W. G. Moody, Shelby; Leroy H. Moss, Whitehall; E. S. Nivision, Mendon; E. E. Ormsby, Clio; W. F. Osterlee, Grand Rapids; G. W. Otto, Lakeview; H. D. Packard, Flushing; J. W. Smith, Benton Harbor; S. Swarthout, Marshall; C. J. Tietz, Saginaw; F. C. Warner, West Bay City; E. T. Butzbach, Benton Harbor; Jesse H. Bruce, Ewart; A. Drisler, Jr., Saginaw; F. L. Failing, Grand Rapids.

The next meeting of the board will be held at Star Island, June 24, 25 and 26.

Illinois Board of Pharmacy.—At the practical examination held in Chicago February 13, 14, 15, the following were registered as registered pharmacists

by examination: J. Adams, R. W. Allen, E. H. Allen, R. W. Baker, J. W. Chladek, Jr., M. A. Colin, R. S. Collins, E. Van Delden, M. A. Dubois, I. H. Emple, P. Erb, C. P. Gieraltowski, F. W. Gregory, W. J. Hamilton, C. H. Hoffman, H. Johnston, C. G. Knight, V. T. Lewis, W. T. Liddell, H. E. Lindblade, M. McAnany, H. C. McWilliams, P. A. Nyström, R. Reuter, L. Roettig, E. E. Rossman, S. Rubenstein, F. Rudnick, E. Seward, W. W. Sherman, C. A. Soule, F. M. Thora, F. W. Windmüller, W. T. Winters, E. C. Zobel, of Chicago, R. T. Abernathy, Summer; S. C. Davis, Morton; F. I. Ellis, Highland Park; C. P. Guenther, Freeport; H. Russell, Hebron, and J. Ulrich, Peoria.

The following passed a satisfactory examination as assistant pharmacists: G. Bollinger, J. P. Brennan, J. M. Callender, K. S. Chulzinski, T. Cupit, Jr., G. H. Cushman, D. Flavin, K. R. Forston, F. P. Hauher, W. P. Hiller, P. Johannes, W. H. Kelly, D. Landau, L. Lowenthal, L. Mrazek, D. F. McNah, M. B. McSherry, A. A. Rowland, H. J. Schulte, of Chicago; and C. A. Dolloger, Wheaton. Twelve failed. Next meeting April 10, at No. 173 Thirty-ninth street, Chicago.

MICHIGAN UNIVERSITY NOTES.

The School of Chemistry which was conducted during the summers of 1891 and 1892 received such hearty approbation that the faculty of the literary department, under the authorization of the board of regents, decided to organize a permanent summer school upon a much broader basis. Accordingly a committee was appointed to devise plans and perfect arrangements for a more extended curriculum for the summer term of 1894. The committee assumed that a large proportion of the students would be superintendents and principals in schools and teachers in high schools and academies, who would desire to enlarge their academic and professional preparation for their special work, and therefore arranged a programme with immediate reference to that end. However, students wishing to review studies preparatory to presenting themselves for admission to college or university, will find courses directly adapted to their wants. In addition to chemistry, instruction will be given in the languages, mathematics, physics, botany and other sciences during the six weeks beginning July 9 and ending August 17. The University libraries, laboratories and museums will be open to students subject to the usual regulations.

Donations to the museum of the School of Pharmacy have been made as follows: Frederick Stearns & Co., of Detroit, kindly presented an excellent specimen of the mineral wax, ozokerite, thereby completing the collection of waxes derived from the three kingdoms of nature. We have received a line of the most important digestive products from the Armour Laboratory, Chicago. That portion of Michigan's exhibit in the forestry building, Jackson Park, which related directly to pharmacy has been placed in the museum. A beautiful specimen, nearly four feet high, of the flax-seed plant was collected and presented by H. W. Snow, Ph. C., '84, of Omaha, Nebraska. We are indebted to Lehn & Fink, New York, for a musk caddy, oil of lemon drum, two essential

oil containers from China, an oil of rose canteen, a large gourd of Harlaodges' arow, and an original package made of raw-hide in which Honduras sarsaparilla was shipped.

A Journal Club of Chemistry, composed of professors, instructors and advanced students, has just been organized. Each member is to present during the semester a complete report of the bibliography of two chemical subjects which he desires to select. Credit is given in the literary department to advanced students just as in any other course. The history or research upon acetone and its derivatives was the first subject discussed at the meeting Wednesday, February 21.

It is customary for the various professors to notify by mail students who have been delinquent in work during the semester, of the "condition" imposed upon them. As a rule these "conditions" are sent so they will be received on Monday evening following the close of the semester. An unusually large number of students went their way to the evening delivery, sincerely hoping that no mail will be forthcoming. One of the Ann Arbor merchants conceived the idea of sending out a number of advertisements in envelopes, which in appearance and address were to be close imitations of the original notices. The scene at the delivery window was a sorry one, as the anxious students stepped up and received, as they supposed, the dreaded notice. As the envelope was handed out the student would turn pale, or perhaps red with anger, suddenly hide the missive, retire to some secluded spot or under the glare of an electric light and tear open the envelope, only to break forth into spasmodic gestures and perhaps mild expressions of profanity as he read: "Buy your second semester books of _____ and save money."

Alumni Association St. Louis College of Pharmacy, has elected the following officers for the ensuing year: Charles A. Lips, president; Sam E. Barber, first vice-president; Charles F. Geiger, second vice-president; Theodore F. Hagenow, recording secretary; Benjamin J. Otto, corresponding secretary; Charles Gietner, treasurer; Oscar F. Helmeyer, registrar; William C. Bolm and Dr. J. C. Falk, members of executive board.

The membership of the association has increased during the past year from 245 to 283.

T. Wah Hing, M. D., a Celestial physician of Sacramento, has applied for a position on the Board of Health.

Plouf vs. Cavanaugh is the title of a suit in court at Oakland, Cal. The gentlemen were partners in a drug store, whose principal stock in trade consisted of "Plouf's Famous Rheumatism Cure." It seems that during the absence of Plouf, Cavanaugh sold the store for a good round sum and now the partner sues for an accounting.

A rancher on Vashon Island, in the Puget Sound country, found a box floating in the water which contained about 200 pounds of what he thought to be water-proof paint. He proceeded to paint his house with it from roof to cellar and it turned out that it was \$3,000 worth of opium which had been thrown overboard by smugglers. The rancher has the distinction of having the most expensively painted house on the Pacific Coast.

THE O. & W. THUM CO., GRAND RAPIDS, MICH.

OTTO THUM. FERDINAND THUM.
HUGO THUM. WILLIAM THUM.

TRADE COMMENT.

DIRECTORY SUPPLEMENTS.

The third (1894) edition of the Era Drugists Directory has now been issued, and the regular publication of the "supplements" to this new edition was begun in the (February 1st) issue of The Pharmaceutical Era. We solicit from our readers information regarding any changes among the drug stores in their locality, such as new stores, removals, sales, failures, deaths, etc., etc. Address

D. O. HAYNES & CO., Publishers,
DETROIT, MICH.

Judge Gary, of Chicago, has created a useful precedent by reversing a case because the witnesses were bullied and worried by the attorneys.

It is intimated that the porous plaster industry is enjoying considerable of a boom since the issue of Columbian postage stamps was discontinued.

Co-operative societies are creating havoc with the prices of drugs in Belgium, and as a consequence the regular pharmacist have been compelled to reduce dispensing charges.

According to "The South-West," a bargain is a transaction in which each party thinks he has cheated the other, and consistency is defined as a jewel often sold to pay the price of success.

Lewis A. Langton, 35 W. Maryland street, succeeds to the firm of Comstock & Langton, 87 Commercial Club, Indianapolis, Ind. They are manufacturers' and importers' agents.

The failures in the United States reported by commercial agencies during January, 1894, amounted to over \$30,000,000, while those for February footed up only \$15,000,000, a decrease of a little over 50 per cent.

Evidently cleanliness is not next to Godliness in some parts of England, for we are informed that a magistrate in the tight little island has ruled that combs, sponges, etc., are not necessities and a pharmacist has been fined for so considering them.

To show the great saving which will be made through the construction of the Manchester ship canal it has been estimated that the former railroad rates from Liverpool to that city were equal to the transportation rate for 8,000 miles at sea. Figures of this kind may be useful in the investigation of the status of the Nicaragua Canal Company which was instituted by the Senate a few weeks ago.

The Supreme Court of Alabama has decided that commercial ratings are nothing more than the estimate of a third person as to a man's financial condition, and the amount of credit which, in the opinion of such third person, may be safely given. They cannot be used as evidence for or against him as to his real financial condition at the time to which they relate.

A coroner's inquest held upon the remains of a dispensing chemist in England brought forth the medical opinion that death was "due to bronchitis accelerated by a shock following a fall, acting upon a constitution weakened by alcohol," and a verdict to that effect was rendered. In America such a condition of affairs would result in a verdict that death was due to a "complication of diseases."

It is stated that the \$250,000 which was to be raised by subscription, as an addition to a similar fund appropriated by the last legislature of New York State, has been raised, and that the project of a botanic garden at Bronx Park, New York, is an assured fact. It is thought that the fund can be further increased to one million dollars through the same means.

A clever swindler, with headquarters in Chicago, has been advertising in Holland papers for physicians to locate in different parts of the country, guaranteeing free house rent and an income of \$5,000 per year. All applicants were requested to send their diplomas. The scheme was discovered by the Netherlands consul, who intercepted thirty replies to the advertisement. It is presumed that the advertiser intended to sell the diplomas thus obtained.

It is said that within a short time the Florida sponge industry will be centered near Tarpon Springs, near the mouth of the Anclote river. The facilities there are excellent as a rendezvous for the sponge fleet, being within a few hours' sail of the fishing ground, while the present headquarters of the industry at Key West requires a two weeks' sail. Several Key West sponge merchants are making preparations to remove to Tarpon Springs.

The United States Circuit Court of Appeals has recently decided that the clause in the bill of lading of transportation companies exempting them from liability for loss or damage, unless written claim be made within thirty days after such loss or damage, is void. Another clause providing that the carrier shall not be liable for loss or damage unless action be brought against it within three months was decided to be reasonable, as having within its scope all losses or damages sustained in the ordinary course of business.

In commenting upon the patenting of a new remedy the Chemist and Druggist notes that an English patent was granted in 182 to H. Erdmann, Haale-on-Saale University, Germany, for the use of rubidium iodide as a remedy for syphilis. Intumescence of the glands and other maladies, and asks why a fact in therapeutics can be patented. An observance of the law in this instance would render it necessary for the physician to obtain the consent of the patentee before writing a prescription including the remedy named.

A certain experimenter, says the Plumber and Decorator, has been trying the comparative effect of various sorts of decoration upon the lighting of rooms. Taking a room hung with black cloth he illuminated it with 100 candles, and then counted the number of candles necessary to bring rooms decorated in other ways to the same degree of illumination. He found in this way that a room with dark brown paper required eighty-seven candles to make it as light as the black cloth one with 100. A room with blue paper took seventy-two candles, and one with pale yellow required sixty. A room lined with panel work either in natural wood or in white paint needed fifty candles; one with dirty paneling required eighty, and a room with plain whitewashed walls took only fifteen.

An Ohio company has located a plant at De Land, Florida, for the manufacture of starch and flour from cassava and sweet potatoes.

In commenting upon the litigation which is now going on between the various firms engaged in the business of rubber-reclaiming on the question of infringement of patents, the India Rubber World says: "The fact is that recovered rubber constitutes a large proportion of the essential raw material which enters into rubber goods of all classes. For every pound of crude rubber used, there is another pound of reclaimed rubber used also; and the processes of manufacture have advanced to such a stage that the reclaimed product serves the purpose even better, under existing methods of manufacture and in view of the market demand, than though the goods were made wholly of crude rubber. In short, recovered rubber is a staple product, and its cheapness and excellence are at the very basis of prosperity in rubber manufacture."

Advices from Pomona, California, state that there never has been such a season of activity in planting olive orchards in California and Arizona as this year. All the olive nurseries in Pomona have been working day and night for three weeks in filling orders for olive trees, and have more orders on hand for olive trees than they can fill. Shipments are made all over the state. Thus far about 300,000 olive trees have gone out from there to points in southern and central California, and fully 100,000 more trees will be shipped before the season closes. The great financial success which has been achieved in olives in southern California orchards in the past two years has given unusual impetus to this industry. The olive crop in Pomona valley during the past season amounted to over \$50,000, and it was a short crop. Seven years ago there were less than forty olive trees in the whole valley.

A method of testing the durability of paint that is often used is to cover a piece of glass with the pigment that has been mixed with raw linseed oil and to expose it to the action of the sun and weather for several months, carefully noting its condition at regular intervals, say twice a month or even once a week. When it is considered that paint is not applied to glass in ordinary work but to wood, which being absorbent, is an entirely different thing, it might appear that the value of the experiment is not considerable. As a fact, the test is a valuable one if a test of comparison is made, says the Plumber and Decorator. Comparison is the key note of all practical paint testing. In the case referred to, a piece of glass should be painted with a pigment, the durability of which is well known, and then it should be exposed side by side with the sample under examination. Suppose, for instance, that it is desired to test the probable durability of a mixed paint. If first-class white lead mixed with raw linseed oil is applied to one sheet of glass, and the mixed paint to another, and the two sheets of glass are exposed to exactly similar conditions, valuable information can be obtained as to the probable durability by comparing the two. The test may be made more useful by painting and exposing two boards in the same manner and at the same time as the glass.

WORKS OF THE O. & W. THUM CO.

IN the summer of 1876, daily after school hours, Otto and William Thum, then school boys, spread sticky fly paper in the laboratory of their father's drug store at Grand Rapids, Mich., to supply the requirements of its trade. This amounted to about fifty sheets per day and each day fifty sheets were sized and hung up to dry, and sheets which had been sized the day before were "stuck."

Such was the beginning of Tanglefoot, which like so many successful articles, had a most humble and modest beginning. Sticky fly paper was not by any means new. It had been used many years before, had fallen into disuse and had been entirely forgotten by the dealers; but about this time was again revived locally, and was meeting with favor as a novelty.

The boys, who were somewhat ambitious, saw an opportunity for making a little pocket-money, and soon had other smaller boys out selling from store to store and from house to house. Jobbers did not carry sticky fly paper at all, owing to its perishable nature. Druggists who sold it were compelled to make it themselves, and many did not care to do this on account of the work. Those who were friendly, as they began to have calls for it, bought it from the boys, and they did a thriving little business. Things went on in this way for a couple of years, during which small orders were occasionally received from neighboring small towns, and occasionally the local jobbers would send in for a box or two to fill an order. By 1879 Thum's Sticky Fly Paper, as it was then known, was quite generally sold throughout western Michigan.

Sticky fly paper of those days was not the perfected article of to-day, but was an ephemeral product good for a few days only. It was crudely made by hand from existing crude formulae; was not provided with any sealing or retaining device of any kind; would soon run out at the edges, and, if not made and sold quickly it would spoil on the dealer's hands. Therefore it had to be made fresh every day to fill immediate orders for immediate wants only. The spontaneous increase in the demand made it evident that a large and remunerative business could be built up, if only suitable machinery could be obtained to turn out large quantities quickly to supply orders from jobbers on demand, and to insure fresh goods.

In 1880 the need of machinery was keenly felt, but none could be purchased. It had first to be invented, and Otto, whose

natural mechanical inclinations favored him, applied himself to the task. William, who was then working in his father's drug store, devoted what was left of his small salary to help float the enterprise, for building new machinery was then, as now, expensive, and the profits came nowhere near meeting the outlay. By the next season machinery had been perfected which answered its purpose fairly well, and it was certainly a great improvement over hand work. About this time the first orders from outside began to come in, T. H. Hinchman & Sons being the first to buy, and they were quickly followed by other Detroit jobbers, F. W. R. Perry, acting as agent for Detroit. From this time on the sale began to increase rapidly, but the gains up to 1883 consisted entirely of experience. Although the sticky composition had been greatly improved, and the paper better prepared, the product was still a very perishable article and two weeks generally saw the end of its usefulness. The jobbers, from the nature of the article, were prejudiced against the very name of sticky fly paper, and they had to be protected against all kinds of losses. The paper, owing to its instability, had to be shipped by express at high rates, and the larger the territory grew to be supplied, the greater became the risks and the losses until finally they were in excess of the profits. It was clear that if the business was to be continued, and was ever to net anything more desirable than experience, and sad experience at that, then the nature of sticky fly paper would have to be radically changed. The leading question became how to make the paper permanent. It must be made to remain perfect for at least two years. The first thing to be thought of was to devise some means of restraining the soft, semi-liquid catching material, and many were the plans and schemes considered; as many were rejected as useless or impracticable until finally the present wax border was evolved, which with some modifications is still used. During all the time of experimenting extending over a period of two years, which constitute the dark middle age of Tanglefoot, the manufacture of the unsealed paper was continued at a loss, and all the money that could be raised by borrowing, coaxes and threats, was used to fill up the gap until the perfected paper could be turned out. This finally did occur towards the close of the season of '83. It was taken up eagerly and enthusiastically by all to whom it could be offered, and at last the turning point was reached.

The inventory of January 1, 1884—ten years ago—showed on hand: the grand prize, "the patent for the sealing border," several lesser patents, a perfect and complete little plant, high hopes, almost limitless experience, no money, and the jobbers' confidence yet to gain. In the spring of '84 dawned a new era for the boys, the sealing border was making for itself a reputation, and the knowledge of it was spreading. W. H. Schieffelin & Co. were the first to order outside the state, Mack & Co. and C. F. Richards & Co. were the pioneers on the Pacific coast. The Lamar Drug Co. yielded soonest in the south. Now every wholesale drug house in the United States handles Tanglefoot.

Early in their career the boys recognized that to be popular their paper must be cheap, and that every improvement followed by a reduction in the cost must apply to the price as well, so that from \$7.50 per case in '84 it has been reduced to \$3.00 per case in '94. In 1880 the consumer paid five cents for a small sheet, 9x16, while now he gets a double sheet of twice the catching surface, and three times the catching value.

From 1884 to the present time the progress of Tanglefoot has been uninterrupted, each year bringing new customers and larger orders. Every winter has been spent in increasing the facilities and improving the product. In 1886 Tanglefoot was made for the first time on its own premises, which consisted of a room fifty feet square. Now it requires a floor space equivalent to twenty-four such rooms, five of which are filled with special machinery and labor-saving devices invented and perfected by Otto and William Thum. Others contain general machinery, such as printing presses, cutting and creasing presses, box and case machines, melting and mixing tanks, etc. Several are used for hand work, as sorting paper, folding strawboard, and folding the holders. The remaining rooms are used for storing. Everything is conducted on the most economic principles, and everything excepting the raw material is made on the premises. The whole plant is run with system, precision and care, and every step in the manufacture is carefully supervised by one or the other of the firm. The great amount of care and watchfulness required can hardly be conceived by one not in the business, and is seemingly entirely at variance with the innocent and simple appearance of a sheet of fly paper. The least carelessness may be productive of serious results, a single faulty sheet may spoil an entire

box, prejudice a dealer, and lose a customer.

The present premises consist of a substantially built main building 300 feet long, two and three stories high and supplied with all the latest devices for convenience, comfort and safety, receiving and storing sheds, power house and water works, machine and carpenter shops, all fully equipped to build all special machinery used. The full capacity of the plant during the season is 2,000 cases per day, amounting to 20,000 boxes or 1,000,000 single sheets, equal to a strip of Tanglefoot 250 miles long. When it is considered that all of this is subjected to six distinct operations before it becomes Tanglefoot, besides the packing into boxes and lastly into cases for shipping, some idea may be formed of the vast amount of work performed on days when the full capacity is utilized. During the season of 1893 150 hands were kept busily employed.

In 1892 the concern was incorporated with an authorized capital stock of \$150,000, which is all paid in. With the incorporation William became president, and besides his regular duties his speciality is to attend to the inevitable infringer, who is numerous since success is assured. Otto vice-president and manufacturing manager. Hugo is in charge of the experiment room, in which he and others are continually at work in the hope of still further improving the compounds which have made Tanglefoot so successful. Over 2,000 experiments, each thoroughly and practically tested, are fully and minutely recorded on the laboratory records. F. Thum is secretary and treasurer.

The wonderful increase in the use of sticky fly paper must be ascribed to the great improvements in its essential features, viz.: permanence, lasting utility, cheapness, appearance, and its general adoption by the retail trade. The signal success of the company is due to the indefatigable application of its originators, Otto and William, to their unshaken confidence, their untiring efforts through bad and worse, to their fixed determination to supply the best and to excel; also to their unvarying policy of giving the selling price the benefit of all saving due to improved methods and increased production. They have always enjoyed the confidence of the jobbers with whom they have business relations. The retailers, too, though not personally acquainted, have from the first taken very kindly to Tanglefoot, and have very generally given their support and co-operation.

NEW PRICE ON PANOPEPTON.

Fairechild Brothers & Foster announce, that on and after March 1, 1894, the trade price on Panopepton will be \$8.50 per dozen.

LIQUEFIED CARBONIC ACID is capable of developing four to five times more power than compressed air. If the carbonic acid is exhausted into the air the cost is too great for ordinary power purposes, but if the exhaust is condensed the engine will have the same theoretical efficiency as an engine using any other vapor through the same range of temperature, and the working pressures will be very high, so that practical difficulties are met with.

Remember that the indexes for each issue are always to be found on first red sheets.

DRUG STORE MANAGEMENT.

The belief that things could be improved has been dominant from the earliest ages down to the present time, and none seem to be more imbued with the idea than the active people of this year of grace 1894. Looking backward at the progress made during comparatively short intervals of time, everything seems possible from the fact that some of the greatest achievements are really simple affairs when familiarity makes us acquainted with their details. But in looking forward, there are so many in art and science who can tell us what is wanted, but display a great poverty of practical suggestions when the initiative is to be taken. However, the belief prevails. It is constantly bringing us good results and its scope is unlimited.

In applying this idea to practical drug store management, past progress points to something still better. Until the average druggist is willing to admit that perfection has been reached, changes from manners and methods which have become conventional will be the order of the day, and the discussion of such matters will be an open one.

The growth of pharmacy from its earliest beginnings has always been a favorite theme for pharmaceutical writers, and detailed descriptions of the shops of the early apothecaries are given which excite our sympathy for the fathers of the art. At the same time it is perhaps fortunate that at present we cannot read the history of pharmacy which will be written two hundred years hence. If contentment and satisfaction with existing conditions had been characteristic of human nature, we can imagine that the drug store of the present might have resembled the "needy shop" with "beggarly array of empty boxes, green earthen pots, bladders, musty seeds, thinly scattered to make up a show," as described by the impassioned Romeo. The incident which gives rise to this description might, in the light of history as reflected in fiction, be regarded as the turning point in the career of the "cattiff wretch" who violated the laws of Mantua and sold a dram of theatrical poison for forty ducats to the famous scion of the house of Montague. We might imagine that after purchasing food and alleviating the "misery which had worn him to the bones," the people of Mantua were informed that "Signor Apothecary, who runs a drug store at the northeast corner of Capulet Square, had purchased an entirely new outfit, consisting of quarter-sawed oak fixtures, show cases, shelf ware, etc., and, as the Bard of Avon was not afraid of anachronisms, it might be proper to add that he purchased an elegant new soda fountain. The people, like those of the present day, noting such an improvement in the selling place of drugs, immediately began buying medicines, with the consequence that a new chapter was added to the record of pharmaceutical evolution.

Another instance of drug store arrangement which fiction records is found in the establishment of "Sawyer, late Nockemorf," the proprietor of which, after recalling Mr. Pickwick with sundry rum punches, compounded and dispensed through the agency of the mortar and graduates, gravely informed him in regard to the fixtures of the pharmacy, that half the drawers had nothing in them, the other half would not open, and that hardly anything in the shop was real except the leeches, and they were second-hand.

This account is useful as an enduring record of the fact that pharmacists of less than one hundred years ago had "back rooms." The origin of the show glasses of the apothecary has been laboriously traced back to a period of considerable antiquity and the facts duly noted in the annals of pharmacy, but polite literature, in the form of Tenneyson's "Maud," will forever bear witness that in the nineteenth century,

"Shoo must lie down arr'd,

For the villainous centre-bits
Grind on the wafel-ears,

In the hush of the moonless nights.

While another is cheating the sick

Of a few last gasps as he sits

To pestle his poison'd poison

Behind his crimson lights."

While this latter instance is undoubtedly a tirade against "substitution," the identity of one of the principal decorative features of the drug store of the present day is quite clearly established.

The modern drug store has long received due credit for the position it occupies in the social economy of its neighborhood. Its portals swing open to the man who does not know what he wants, or has failed to get what he wants elsewhere, and the great variety of demands to which it must cater through its various departments necessarily affords a great range for the arrangement of such departments. The appointments now almost universal in pharmacies seem to answer their purpose fairly well, but it is quite frequently the case that a man is found who says that he never yet has seen a drug store that was arranged exactly to suit him. It is of this man that we must expect great things in the future.

From the standpoint of strict utility there is one feature of drug store arrangement which might be considered as anomalous. Every pharmacist who pretends a regard for well-established proprieties makes it a point to place upon one side of his store at least a long line of shelving upon which are displayed elaborately wrought and lettered bottles and jars whose chief mission seems to be to create a certain amount of awe on the part of the public which vainly tries to read the formidable names thereon, and to engage the attention of the apprentice in keeping them clean. These bottles are but rarely disturbed by any other person, as the actual work of dispensing prescriptions is almost always conducted behind a shelved structure in the rear, where are found the real drugs of the establishment, many of the preparations of the "display shelves" being duplicated upon the "working shelves."

This feature is mentioned not in a spirit of captious criticism, but more with the idea of developing an answer to the "why?" which inevitably arises when the condition is noted. Is it not possible that even pharmacists are doing much work, and expending some money in doing some things, simply because they have been done heretofore? This arrangement may possess advantages which more than overbalance its disadvantages, but the man who never saw a pharmacy that was arranged to suit him may be able to decide the question for us. There are so many points to be considered in arranging a drug store that even our writers of text books upon pharmacy, who submit plans for such a purpose, do so with a bill of exceptions. Acting upon the idea, how-

ever, that the proper place for drugs is in close proximity to the place where they are to be used in dispensing, a plan is submitted herewith in which an endeavor is made to illustrate that idea. As usual, a quite lengthy bill of exceptions goes with this plan, which is offered not so much with the view of indicating just how a store should be arranged, but more for the purpose of finding out how many bet-

line which are usually dispensed from the ordinary shelfware and drawers. The shelves upon the opposite side of the table contain all the drugs necessary for prescription work, and should also have a well-designed poison closet in connection therewith. There are many conflicting ideas upon the best construction for this necessary fixture, but it is believed that a locked closet—one that is locked with a spring lock, and can only be opened with a key, with an arrangement which prevents its being left open, is the best arrangement, as an absent-minded person is not very likely to get the wrong drug from it after going through the very definite operation of unlocking it. It will be observed that the dispenser is isolated as much as possible from all disturbing influences, as it is believed that the practice of constructing prescription cases so that the operations of the store can be watched by the dispenser, is one that seriously interferes with the careful work which is expected of him, and in cases where the store is left in the charge of one man the fixtures and display of goods in the front of the store should be of a character which is a safeguard against shoplifting.

Around the walls of the rear of the room are found the sink, closets, various utensils and fixtures for laboratory work, and the entrance to the cellar, which will next engage our attention. This room is a most valuable adjunct to the modern drug store, and at the same time its convenient arrangement seems to be most universally neglected. As a store room for heavy goods, for articles in original packages and stock not affected by a low temperature or dampness, it is by far the "best room" in the house. Of course, it is taken for granted that the cellar is dry, light and well ventilated. In the plan submitted the cellar is reached from the

cellar as have been removed from the packing cases. On the opposite side of the cellar, extending half its length, is placed shelving for goods and preparations kept in stock bottles and other containers. The remaining space along the same wall is occupied by a raised platform of suitable height, extending some distance from the wall, upon which are placed liquids, liquors, etc., kept in barrels. Along the rear wall and occupying the space between the platform mentioned and the outside entrance, is a space provided with a suitable floor, and divided off from the rest of the cellar, devoted wholly to the storage of acids, inflammable goods, etc. Shelving also extends along the front end of the cellar. In the center of the room is placed a rectangular platform, several inches in height, for the storage of heavy goods, and such drugs and chemicals as are sold from the original package, barrel, box or other container. In this category may be classed coppers, sal-soda, whiting, sulphur, brimstone, Epsom salt, Glauber salt, flaxseed, etc. A suitable place should also be provided for the storage of oils, turpentine, varnish, etc. In the cellar may also be situated a pharmaceutical laboratory containing the necessary furniture, and such apparatus as the demands of the business require.

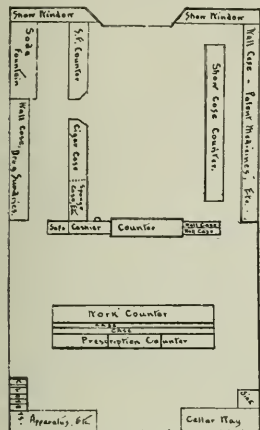

TRADE IN TAHITI—1892.

The United States consul at Tahiti, in his report on the trade of that island, says: "Vanilla beans have decreased greatly in value during the past two years, owing to the overstocking of the San Francisco market. During the month of December they enhanced slightly in value; but no marked improvement can be reported, and in my opinion, none will be realized until the fifteen tons of Tahitian vanilla in San Francisco are sold. America is the largest market for the Tahitian vanilla, and all grown on this island finds a market there, with perhaps the exception of about one ton, which is sent to other countries. This year there were exported to all countries during 1892, 25,560 pounds of vanilla, valued at \$38,599. Owing to the very low prices paid for vanilla beans this year, some native planters have neglected to inoculate their plantations, and in consequence next year's crop will be at least two or three tons less than that of 1892. This drop in Tahiti vanilla was caused by the great quantity of improperly cured beans which have been sent to San Francisco during the past few years. Natives have become very careless in the curing process, many of them sending their beans to market without having the water first extracted, and consequently when they arrive in San Francisco they are rotten. I would therefore caution all buyers in the United States carefully to examine all vanilla coming from Tahiti before purchasing, as the outside appearance of a bundle may be all right when the inside will contain perhaps twenty to thirty rotten beans."

ter ones there are in this country." The sketch shown is for an establishment where several persons are employed, and is intended to point out a number of features which would seem desirable. The plan is such that it can be adapted to suit the dimensions and space usually found in the ordinary store building. It will be observed that the front portion of the store is devoted entirely to the display of "original package" goods, patent medicines, drug sundries, cigars, sponges, etc., and the soda fountain, while the rear portion is the workshop of the establishment, and contains all the articles of the apothecary's art which require his professional attention before they are ready for the public. The soda fountain is placed at the left-hand corner of the room, where it is easily reached from the street and is in a position to advertise itself. For the same reason the cigar case immediately adjoins it. Midway between the front and rear of the room, dividing it in the middle, is placed a counter, at one end of which are two wall cases, back to back, and at the other the cashier's desk and safe, both being built in the counter. This counter space is utilized for wrapping and the transaction of the general business of the store. The rear portion of the room back of this counter is the workshop proper, and the chief article of furniture consists of a long and wide table, or a similar arrangement of a base with drawers, upon which are placed two sections of shelving, back to back, the table or base being wide enough to allow a good working space in front of each section, that facing the counter being used as a work table for weighing, etc., while that in the rear is to be used as a prescription counter, which is long enough to accommodate at least three dispensers. The shelving facing the front of the store contains all those articles in the drug and chemical

ground floor by a stairway in one of the rear corners. Just in front of the stairs, and directly underneath the water supply on the upper floor, is placed the sink and a well-arranged set of bottle racks and washing troughs, the floor space under these being so arranged as to admit of hasty drainage and ready drying. Along one side of the cellar wall is placed shelving with compartments systematically arranged as to sizes, for such empty bot-

The Birney Catarrhal Powder Co., of Chicago, recently obtained an injunction against J. H. Wells, druggist, corner of Randolph and Dearborn streets, and a lawyer named Dearbich, who were operating under the name of the California Catarrhal Cure Co., and were using advertising matter and containers which it is claimed very closely resemble those of the Birney Co.

PURE FOOD AND DRUGS.

The text is given below of a "pure food" bill which was introduced into the House of Representatives a few weeks ago by Mr. Hatch, of Missouri. This action will recall the fate of the Paddock bill which occupied the attention of the preceding Congress, but it is claimed that the present bill is a great improvement over the former and is likely to find many friends among our legislators when it comes up for debate. In view of the fact that different state boards of health and sanitary officers have frequently felt the need of an authoritative definition of adulteration, the introduction of this bill seems quite opportune:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the introductory words of the act, "Territory, or the District of Columbia, from any other State or Territory or the District of Columbia, or from any foreign country, or of any article of food or drugs which is adulterated or misbranded within the meaning of this act is hereby prohibited, and any person who shall knowingly violate any provision of this act shall be guilty of a misdemeanor, and for such offense be fined not exceeding two hundred dollars for the first offense, and for each subsequent offense not exceeding three hundred dollars, or be imprisoned not exceeding one year, or both, in the discretion of the court.

Sec. 2. That the term "drug" as used in this act shall include all medicines for internal or external use. The term "food" as used herein shall include all articles used for food or drink by man, whether simple, mixed, or compound. The term "misbranded" as used herein shall include all drugs, articles of food, or articles which enter into the composition of food, the package or label of which shall bear any statement, purporting to name ingredients of the article, and which is retained or not being contained in such article, which statement shall be false in any particular.

Sec. 3. That for the purposes of this act, an article shall be deemed to be adulterated—

First. If when sold under or by a name recognized in the United States Pharmacopoeia, it differs from the standard of strength, quality, or purity according to the tests laid down therein.

Second. If when sold under or by a name not recognized in the United States Pharmacopoeia, but which is found in any other pharmacopoeia, or other standard work on standard medicine, it differs materially from the standard of strength, quality, or purity according to the tests laid down in said work.

Third. If its strength or purity fall below the professed standard under which it is sold.

Fourth. If it be an imitation of or substituted for the specific name of another article.

In the case of food or drink—

First. If any substance or substances which have been mixed and prepared with it so as to reduce or lower or injure or affect its quality or strength, so that such product, when offered for sale, shall be adulterated, and shall tend to deceive the purchaser.

Second. If any inferior substance or substances has or have been substituted wholly or in part for the article, so that the product, when offered for sale, shall tend to deceive the purchaser.

Third. If any valuable constituent of the article has been wholly or in part abstracted, so that the product, when sold, shall tend to deceive the purchaser.

Fourth. If it be an imitation of, or substituted for the specific name, brand, or trade mark of another article.

Fifth. If it be mixed, colored, powdered, or stained in a manner whereby damage is concealed, so that such product, when sold, shall tend to deceive the purchaser.

Sixth. If it contain any added poisonous ingredient, or any ingredient which may render such article injurious to the health of any person consuming it.

Seventh. If it consists of the whole or any part of a diseased, filthy, decomposed, or putrid animal or vegetable substance, or any portion of an animal unfit for food, whether manufactured or not,

or if it is the product of a diseased animal, or of an animal that has died otherwise than by slaughter. Provided, That an article of food or drug, which does not contain any added poisonous ingredient, shall not be deemed to be adulterated or misbranded in the following cases:

First. In the case of mixtures or compounds which may be now, or from time to time hereafter known as articles of food under their own distinctive names, and not included in definition fourth of this section.

Second. In the case of articles labeled, branded, or tagged so as to plainly indicate to increase the bulk, weight, or measure of the food or drug, or conceal the inferior quality thereof: Provided, That the same shall be labeled, branded, or tagged so as to provide for comparison in this act shall be construed as requiring or compelling proprietors or manufacturers of proprietary medicines to so label or tag to disclose their trade-fraud.

Third. When any matter or ingredient has been added to the food or drug, because the same is required for the production or preparation thereof as an article of commerce, in a state fit for carriage or consumption, and not fraudulently to increase the bulk, weight, or measure of the food or drug, or conceal the inferior quality thereof: Provided, That the same shall be labeled, branded, or tagged so as to provide for comparison in this act shall be construed as requiring or compelling proprietors or manufacturers of proprietary medicines to so label or tag to disclose their trade-fraud.

Fourth. Where the food or drug is unavoidably mixed with some extraneous matter in the process of collection or preparation.

Sec. 4. That this act shall not be construed to interfere with commerce wholly in any State, territory, or possession, or else of their police powers by the several States.

Sec. 5. Any article of food or drug that is adulterated or misbranded, within the meaning of this act, and is transported, or is being transported from one State to another for sale, and is still in the original or unbroken packages, shall be liable to be proceeded against, in any district court of the United States, within the district where the same is found and seized for confiscation by a process of libel for condemnation. And if it is found to be condemned as being adulterated or misbranded, the same shall be disposed of as the said court may direct, and the proceeds of the sale, less the costs and charges, shall be paid into the Treasury of the United States. The proceedings in such libel cases shall conform as near as may be to proceedings in admiralty, except that either party may demand trial by jury of any issue of fact joined in such case, and all such proceedings shall be at the suit of and in the name of the United States.

GERMAN INDUSTRIAL AND COMMERCIAL SITUATION.

The manufacturing and commercial interests of Germany have reached a stage during the closing months of 1893 which is in some respects unprecedented and offers material for an interesting study. There is, on the one hand, general and vigorous complaint on the part of every class which is likely to be affected by the new forms of taxation that are now under discussion in the Reichstag that business throughout the empire is at a low ebb, profits steadily decreasing, and the cost of living greater than ever before. On the other hand, wherever precise statistics are accessible there seems to be evidence of normal activity, and in many cases of increased product and liberal profits.

The Farbwerke, a large manufactory of aniline colors and chemical products at Hoechst, near Frankfort, will declare at the close of this year a dividend of 26 per cent on its capital of 15,000,000 marks; the aniline and chemical works of Friedrich Bayer, at Elberfeld, will repeat its last year's dividend of 15 per cent; and the Badische Aniline and Soda Fabrik, at Ludwigshaven, near Mannheim, is equally prosperous. And yet all of these companies suffered more or less from the serious prostration of their American export trade during the third quarter of the pres-

ent year, but from which it is now rapidly recovering. It is well understood that in all the standard aniline dyes, the manufacture of which is open to general competition, prices have been reduced to very close margins during recent years, but the prosperity of that branch of business is well maintained by the large profits derived from special patented colors and medicinal preparations, of which each of the large German chemical firms own a number that are patent in its own name in the United States, thus securing to the patentee a monopoly of its production and sale.

A notable example of this is antipyrine, which is manufactured exclusively under the Knorr patents by the Farbwerke at Hoechst. It is estimated that not less than 75 tons of this preparation are manufactured and sold annually, representing, according to one authority, a value of \$1,452,000, the greater part of which is clear profit.

The paper manufacture is likewise, to all appearances, prosperous and profitable, although complaint is heard of the low prices and the serious competition of Norway and Sweden in the manufacture of wood pulp. At Aschaffenburg, an important center of the pulp and paper industries on the River Main, some miles above Frankfort, a number of the mills are working night and day, and one company is making important additions to its already extensive plant. It is noteworthy, in connection with this subject, that a large portion of the American supply of photographic paper is made at Malmédy, a town in Northwestern Germany near the Belgian frontier, whence it is brought to Aschaffenburg and there coated with baryta, then exported to the United States and sensitized at factories in Western New York and elsewhere, and finally sold to consumers throughout our country and exported to Mexico, South America and even to England.

Continuing this examination into the general foreign trade of Germany, for which only the returns of the first three-quarters of the current calendar year are at present accessible, the situation appears to be, on the whole, more favorable than would be expected from the generally despairing tone of the commercial press. The total imports of Germany during the first nine months of this year amounted in weight to 21,935,923 tons, an increase of 1.06 per cent over those of the same months in the preceding year.

Exports during the same period reached 15,264,793 tons, an increase of 6.16 per cent over those of 1892. Putting together imports and exports, the aggregate shows an increase in weight of 3.09 per cent and in value of one per cent over the totals for the same nine months of 1892. This is certainly not a discouraging exhibit for a year of such general depression as the present.

The salient features of the present situation are therefore sufficiently obvious. While nearly all values are extremely low, and profits in many cases meagre, this depression in value of product has been met in many instances in a great degree by corresponding reductions in wages, which (particularly in Berlin and throughout Saxony) are steadily declining. So that, on the whole, the volume of foreign trade has been more than maintained, and the Germans are in good working condition and ready to take prompt advantage of

any improvement that may occur in the American or other foreign demand. Probably no nation in the world is at present more actively or systematically engaged in efforts to extend its foreign export trade than Germany. Profiting not only by the acknowledged success of their own exhibits at the Columbian Exposition, but by all the hints and suggestions that the German manufacturers obtained there from a careful study of the products of other nations, they are now organizing syndicates and associations, each representing a different industry, the members of which contribute to a fund to be expended in sending expert salesmen into foreign markets, studying the wants of each country, and by personal application pushing the sale of German manufactures. In all this they are setting an example that American exporters might profitably imitate.

As manufacturers the Germans may lack somewhat in originality, but they make up for this by their cleverness in copying and adopting promptly the best improvements originated by their rivals in other countries. There are few really valuable American machines or implements which are not more or less closely imitated and abundantly produced in this country. These imitations have been thus far, with few exceptions, inferior in finish and perfection of workmanship to the originals, but their quality is steadily improving; and the tactics of the German exporters will need to be met by equally vigorous and intelligent efforts on the part of our merchants if the latter expect to maintain and improve their standing in the markets of South America, Australia and the east.—U. S. Consular Report, December 22, 1893.

ITALIAN SULPHUR OUTPUT.

Under date of November, 1893, Consul-General Jones, of Rome, transmits the following statistics taken from official sources:

The total production of brimstone in 1892 was 415,555 tons, an increase of 23,027 tons over the output for 1891. The increase is almost entirely due to the greater production of the Sicilian mines, which more than made up for the falling off at the mines in the district of Bologna and Avelino. There was a small increase—406 tons—from the Calabrian mines. The average price of brimstone having fallen from \$23 16 to \$19 27 per ton, the value of the total output in 1893 was \$3,070,260—\$109,135 less than the value of that produced in 1891. The Sicilian mines employed 33,171 hands or 902 more than in 1891; and 2,672,532 tons of mineral were treated, with a yield of 14.067 per cent of brimstone. The average price in 1892 of the several qualities of brimstone delivered at the ports, free on board, was \$19 57, or \$4 20 per ton less than in 1891.

Over 300,000 barrels of vinegar are produced each year in the State of New York.

The Century Manufacturing Co., Warren, Pa., has been organized to manufacture the Century Catarrh Cure and other proprietary preparations.

Chas. Lippincott & Co. cordially invite all druggists visiting Chicago to call on them at their elegant new show rooms, 264-266 Fifth avenue, where a very handsome display of soda apparatus will be seen.

TRADE NOTES.

Indexes on first four red sheets.

W. H. Taylor & Co., 29 Broadway, N. Y., have succeeded Culbert & Taylor.

M. F. Foster & Co., New York City, manufacturers of cigars, have succeeded Hahn, Brussels & Co.

Von Mohl Co., Cincinnati, O., manufactures and sells specialties to the drug trade for the cure of rheumatism, fits, dyspepsia, catarrh, etc.

The H. W. Comstock Remedy Co., Inc., Lafayette, Ind., manufactures a line of proprietary medicines. Their capital stock is \$50,000, of which \$10,000 has been paid in.

As the first step toward getting acquainted all that John Lucas & Co., of Philadelphia ask is that you drop them a postal and get their paint color cards. They give their reasons for this in their advertisement in this issue.

Are you taking advantage of the reduced prices which the A. P. W. Paper Co., of Albany, are offering on their popular brands of toilet paper. Their new catalogue and price list shows how you can sell paper for what it formerly cost you. Write for it.

On page 286 of the Era Druggists' Directory, last edition, the name of E. J. Hussey & Co. appears as Drug Brokers. This they inform us is an error, as they should appear under the head of "Introducers of New Novelties of Merit."

J. B. Burr & Co., Hartford, Conn., are ready to convince the drug trade that they can save them money on prescription blanks, and all other kinds of druggist's printing. They will do this by sending samples and price lists to all who will apply for them.

Smith & Painter, of Wilmington, Del., say that everyone interested in soda water should have their catalogue, which is full of practical suggestions and recipes. As this is sent free upon application, the investment of a postal card in asking for it may be considered a good one.

The Star & Crescent Mills Co., of Philadelphia, have been quite successful in introducing their fine bath requisites to the retail drug trade, and they are now making arrangements to place their goods with one jobber in each large city. The attention of the jobbing trade is directed to their "Hint to Jobbers" in this issue.

"A trial is more convincing than talk" is what the Flower City Cork Works, Rochester, N. Y., have to say regarding their Red Star Brand XXX Corks. If your corks do not suit you in every respect, they suggest that it is time you made a trial of their goods. They invite comparison with all other brands.

The Cascara Laxative Syrup, prepared only for the drug trade by Irwin, Kirkland & Co., of Decatur, Ills., is positively the finest laxative and cathartic on the market. It is composed of their celebrated Cascara Aromatic Fluid Extract in combination with Buckthorn, Senna, Juglans, Rochelle Salt and Aromatics. It is a large and handsome package; costs only 18 cents and retails at 50. Send for sample wrapper.—Adv.

Wm. A. RICHARDSON.

Wm. A. Richardson is a native of New Haven, Conn., where his father was for many years engaged in the wholesale drug business. He received his early education in the schools of his native city and afterward went to Boston and graduated from the Massachusetts College of Pharmacy. His first employment after leaving this school was with the old aristocratic firm of dispensing chemists, Melvin & Badger, and he was subsequently employed by Gilman Brothers, wholesale druggists of the same city. In 1839 Mr. Richardson went to Chicago as the western representative of the Maltine Manufacturing Co., of New York, and in the summer of 1843 entered the employ of Frederick Stearns & Co., of Detroit, Mich., as their Chicago representative, in which position he has remained until quite recently, when he was appointed resident manager of the London office of F. Stearns & Co., at 25 Lime street, London, E. C., England, and sailed for his future home on the S. S. Lucania on March 10th. Mr. Richardson has been given carte blanche in the matter of introducing in Great Britain and on the continent the well-known specialties and pharmaceuticals of the house he represents. Mr. Richardson takes with him the good wishes of a large personal and business acquaintance in New York, Boston, Chicago and other drug centers of this country, and his previous acquaintance with London and Paris, and wide experience with pharmaceutical matters will no doubt contribute to his success in his new field of effort.

Altoona, Pa., January 17, 1894.

H. D. Cushman, Three Rivers, Mich.:
Dear Sir—Your Menthol Inhalers are the best on the market; they are the only ones we can sell without a great deal of talking. They sell on their merits. Please send me some advertising matter. Yours, McMurtrie & Akers.

Parties who desire to put upon the market anything in the pharmaceutical line, should write to B. M. Butler, pharmaceutical chemist, Armitage avenue and N. Pauline street, Chicago, for estimates. Mr. Butler has a large laboratory fully equipped for such work, and is in a position to quote satisfactory prices.

The Chicago Medical Specialty House, 38 Dearborn street, Chicago, have an article in the "Knap" Ladies' Syringe which has proven satisfactory with all users, and affords a liberal profit to the drug trade. Write for detailed description, and see their prices on another page.

In the last issue of our Druggists' Directory we classified the Sagar Drug Co., Duluth, Minn., as wholesale and retail druggists. This, they inform us, is an error. They are an exclusive jobbing house, and have no intention to retail, nor have they any facilities for carrying on that branch of the drug business.

The success and solid reputation of Dr. D. Jayne's Family Medicines have been gained by many years of trial, and the favorable verdict regarding their merits comes from the public itself. Jayne's almanac has always been a favorite on account of its conservative tone and plain language, and their distribution always assists the demand for the goods.

Note the change which W. E. Mattern, 164 Millard avenue, Chicago, makes in his advertisement in this issue. He will send 25 samples free with one dozen Mattern's Headache Powders at 60 cents per dozen and pay transportation. Those who are not acquainted with his preparation can procure a sample box free upon application.

The Flag Salt Remedy Co., of Savannah, N. Y., report a steadily increasing demand for Flag Salt, the new remedy for headache and neuralgia. To further increase the sale of this preparation they now offer 75 samples, with every order for one dozen 25-cent boxes, and one dozen 10-cent packages accompanied by \$2. Write for free sample box.

The Economic Hopking Roll Paper Cutter is for sale by all jobbers, but the dealer who contemplates an improvement in his methods of wrapping goods, should write to the American Roll Paper Co., of St. Louis, for their catalogue, which describes the various sizes, and gives prices for roll paper, both printed and plain.

Every druggist knows that H. Plantek & Son, 234 William street, New York, manufacture capsules, filled and unfilled, for they have been in the business since 1836, but not every druggist has their latest price list. That is a point which they desire to emphasize. You had better send for it and find out what is new in the way of products and prices.

RIVERMOUTH SACHETTES.

It is surprising how quickly the Rivermouth Sachettes have sprung into popularity. "Freston, of New Hampshire," has evidently struck the right key-note. He offers five odors only and claims that they please the most critical trade better than a larger assortment. See his "ad." in this issue.

SAXE'S NEW GUIDE.

A fine soda fountain, good location, and good material are quite necessary for success, but there is one other requisite which forms the "cap-sheaf" for this list of indispensables. It is the "knowing how" to make use of the materials concerned in the making of a glass of soda that counts. It is this fact that renders "Saxe's New Guide" for soda dispensers a valuable aid to the druggist, who intends to place his soda fountain business in a position which will attract the public. The price of this book has been reduced to 43, and the enterprising druggist who desires a little more education on the subject upon which it treats, should begin his schooling at once, and be in readiness when the season opens.

The Hart Manufacturing Co., 13-17 North Jefferson street, Chicago, engaged in the manufacture of soda fountains in 1873, and their success in building up a large trade can be attributed to the fact that their goods and business methods are of the kind described in their advertisement in this issue. Send for designs and prices.

Special attention is directed to what is believed to be a decided improvement in the Index of Goods which was inaugurated in the issue of January list. It is believed that the readers of the Era can now, by turning to pages 21 and 23, on the first red sheets in each issue, easily find any article in which they may be interested.

Beeswax branded "T. L." and "Diamond L" is guaranteed by the manufacturer, Theodor Leonhard, Patterson, N. J., as being strictly pure, sun-bleached, without the use of chemicals. The superiority of these brands can be determined by obtaining sample cakes, which will be sent free upon application. Mention the Era when writing.

In selecting brushes it is a good idea to obtain the kind the painter wants. In looking at a brush that discriminating individual usually looks to see if the name "Whiting" is stamped on the brush. If he finds this name he then closes the matter by saying, "Wrap it up." The discriminating dealer does very much the same when ordering brushes from the jobbers.

With unequalled facilities both in the matter of procuring raw material and having the necessary appliances and capital for working it up and placing it upon the market, the Cudahy Pharmaceutical Co., South Omaha, Neb., claim to be able to make a pepsin which stands all the tests of the U. S. P., 1890, and to sell it at prices which place them far beyond competitors. Send for some of "Rex" brand of pepsin and test it.

The Tyer Rubber Co., Andover, Mass., in presenting to the trade their "Tyrian" No. 3 Oil Atomizer, an illustration of which is shown above, direct special attention to new and desirable features as follows: The guard tube, extending into the bottle, and through which the liquid tube passes, prevents the escape of the liquid in whatever position the bottle may be placed, thus overcoming one of the most serious faults with oil atomizers, namely, the oil running out upon the bottle or bulb, and soiling the hands or clothing. The air in passing through the air point, completely surrounds the liquid point, thus insuring a fine spray without dripping. The liquid tube is attached by a screw thread, and can be easily removed for cleaning, and the bulb is furnished with a quick-acting aluminum valve. Write for prices.

The germ proof pressure and non-pressure water filters manufactured by the McConnell Filter Co., 13 Niagara street, Buffalo, have been tested and tried, and their favorable reputation rests upon a record of good results which they have given. They are especially adapted for druggists' use, soda fountains, etc. Write for circular containing full description and prices.

The Distilled Extracts for soda fountain use, manufactured by Dr. H. L. Bowker & Co., 257 Franklin street, Boston, have met with favor at the hands of the drug trade ever since they were introduced in 1864. They are still popular, with Birch Beer, Root Beer, Bitter Beer and Ginger Ale as especial favorites. Send for fifty-page catalogue describing the goods manufactured by this firm.

"Webber-Pepsin, S. & D." has always had an excellent reputation for its digestive power with both the pharmaceutical and medical professions, and is an especial favorite with the latter. But as the question of cheapness is now considered in connection with every commodity, it naturally had to receive attention from the manufacturers of this brand. They now show the pharmacist that official pepsin, U. S. P., 1890, can be made from Webber-Pepsin at a cost of sixty-three and a half cents per ounce. Write Sharp & Dohme, 41 John street, New York, for full particulars regarding this product.

WORLD'S FAIR PICTURES.

Later parts of the Michigan Central's World's Fair Portfolio fully justify the claim made upon the publication of the first number, that it was the best, the finest and the most artistic of popular publications on the White City.

Each part contains sixteen (16) large plates and is sold for only ten cents. If you haven't seen it, the nearest Michigan Central ticket agent will show it to you, or you can write to O. W. Ruggles, G. P. and T. Agent, Chicago.

HAVE YOU SEEN IT?

Eastern Star Perfume.

The latest success in the line of popular odors made by Foote & Jenks. It is very delicate and delightfully fragrant, yet its endurance and lasting properties when applied to the handkerchief or clothing is perfectly wonderful.

It is pre-eminently a favorite with ladies, and you know the ladies use most of the perfume. Most druggists have some lady customers who

are members of the order of the "Eastern Star" in whose honor this odor was named. Most gentlemen are fond of perfume—also of ladies—and take very kindly to the "Eastern Star" order a bottle of your jobber, or send to Foote & Jenks for sample and price list.

Witch Hazel of itself possesses many curative virtues and it enjoys a favorable reputation as a domestic remedy with the public. When it is put up as an ointment, or rather as Witch Hazel Jelly, as is done by the Mayell-Hopp Co., Cleveland, O., there is sure to be a demand for it. It is just the thing for chapped hands, sore lips and for use after shaving.

When you need any Acetanilid, do not fail to correspond with the Herf & Frerichs Chemical Co., St. Louis, Mo. Their quality is very white and in strict accordance with the requirements of the U. S. P. They are also making a specialty of supplying a very fine, impalpable powder, which is largely used for manufacturing pills, tablets, etc., and is a most excellent quality in all respects.

We hear of all sorts of leaders these days. There is the political leader, the labor leader, and the E. N. Rowell Co. leader. The latter, however, should be placed first in the procession where all the druggists can see it. Printed and lithographed label pill boxes are offered in 10-gross lots at 60 and 70 cents per gross respectively and their advertisement is headed "Can you buy at these prices?"

Attention is directed to the offer in connection with "Old Purity" whiskey, advertised upon another page in this issue. This product is true to name, and its sale is protected by registered label and trade mark, thus creating confidence in the mind of the consumer. The wholesale drug trade is handling this brand extensively, as will be seen by the list given in connection with the advertisement.

Notwithstanding the depression during the past year, The Tilden Co., of New Lebanon, N. Y., found the demand for their preparations so active that their employes had the pleasure of being paid for overtime. As many other houses in the same line only averaged three-quarters time or less, the Tilden people consider this a very handsome testimonial of the regard which the trade has for their goods.

Have you received that Croton Oil Plaster which the Joel A. Connolly Plaster Co., of Boston, Mass., offer to send free to every druggist? These plasters afford an excellent means of administering this oil, and have commanded the attention of the medical profession wherever they are brought to their notice. You can easily do this in your own community. Write for particulars regarding the therapeutics of Croton Oil Plasters.

Wm. B. Burk & Co., of Philadelphia, will celebrate on the 1st of April next, the 25th anniversary of their entering the sponge business. During this time they have become known to the entire drug trade in the east, also in the western drug centers. Square dealing has made customers their friends and largely contributed to their great success. They announce having just received a large importation of Turkish sponges, consisting of bath, toilet, surgeons' and fine flat sponges, which they are prepared to offer at extremely low prices, and druggists sending for a few simple cases can be assured of a satisfactory bargain. Mr. W. B. Burk makes annual trips to the principal markets of Europe and is known as a careful and close buyer.

Dr. R. R. Lansing, of Detroit, has lately received letters patent both in the United States and Canada, on his process of manufacturing Glassine Labels. His new illustrated catalogue, recently issued, should be in the hands of every druggist who intends to start a new store or refit an old one. On April 1, 1894, Dr. Lansing will open a branch at Windsor, Ont., to accommodate his constantly increasing Canadian business.

The popularity of Antikamnia with the medical profession has caused it to be an important article in the stock of the pharmacist, and the manufacturers are very desirous that the retail drug trade shall have some of the benefits accruing from such popularity. They have therefore placed the preparation in the hands of all the jobbers with a view of having it reach the retail trade in the most convenient manner.

The D. B. Scully Syrup Co., 49-51 River street, Chicago, believe that when pure rock candy is ordered the druggist wants just what he ordered. Instead of furnishing drippings or refined residue, they believe in sending out a syrup made by melting the pure crystals which nature furnishes by an unequaled process of her own. They invite the trade to send for prices on both rock candy and rock candy syrup.

Aristol, Sulophen, Europhen, Losophan, Trional, Salphonal, Phenacetine and Piperazine are all preparations which have come into use within a comparatively short period of time. Every pharmacist should be thoroughly posted regarding these new remedies, and should increase his library by sending to W. H. Schiefelin & Co., New York, for pamphlets describing them.

Beef, Wine and Iron in bulk from \$1.30 to \$1.75 per gallon, according to quantity, and \$2 to \$45 per gross in bottles with fine lithographed labels, are prices which Henry K. Wampole & Co., of Philadelphia, are quoting to the trade. Buying everything in large lots and manufacturing in large quantities are the reasons for these extremely reasonable prices. They furnish samples so that the trade can see that the quality is all right.

The Hammondsport Wine Co., of Hammondsport, N. Y., assure the drug trade that their demands for fine goods, and desire for information concerning the same, will command the preferred attention of the firm. All their products are sold under a guarantee as to purity and keeping qualities, and their Ports, Sherries, Madeiras, Sauternes, Catawbas, Clarets, etc., are particularly recommended for dispensing purposes.

All druggists have more or less frequent use for bottle stoppers, collapsible tubes, pill machines, suppository, bougie, camphor ice and cosmetic moulds and other metal goods, but they do not always like to go to the trouble of ordering from the manufacturer whenever a few of any of these things are wanted. This trouble can all be obviated by procuring the catalogue of A. H. Wirz, 913 to 917 Cherry street, Philadelphia. He manufactures a full line of such goods, and they are handled generally by jobbers. All the retailer has to do is to select from the catalogue and the jobber fills the order.

Klinol, the new antipyretic and analgesic, is finding considerable application in acute rheumatic affections and in migraine and neuralgic pains, its non-toxic and non-depressant properties making it a special favorite with the medical profession. Samples will be sent free to the trade or profession upon application to the manufacturers, The Klinol Company, Cleveland, Ohio.

On February 6th, 1894, a jury in the Court of Common Pleas No. 4, city of Philadelphia, rendered a verdict against James Whitall, Philadelphia, surety for E. W. Hoyt & Co., of Lowell, Mass., in favor of F. Hoyt & Co., Philadelphia, in the sum of \$3,000, for damages sustained. This suit was the outcome of a decision of the Supreme Court in a former suit supporting the Philadelphia firm in their contention that they were justified by right of priority in manufacturing Hoyt's Genuine German Cologne. In this prior suit the bill of the Lowell firm was dismissed by the court, and they were compelled to pay all costs, amounting to \$2,850.50.

The Wm. S. Merrell Chemical Co., Cincinnati, O., believe that "written labels" on fluid extracts should always be looked upon with suspicion. A few houses still fill out "fractional pounds" from larger packages, but the system is being discarded for obvious reasons. To fill "orders as written" is the aim of every jobber who would secure a permanent business, and every action tending to destroy confidence should be avoided. Again, why should the risk of identity and quality be assumed by the jobber when it belongs solely to the manufacturer? The Wm. S. Merrell Chemical Co. take every responsibility connected with their Fluid Extracts in original packages, but decline "to father" any article claiming to be "Merrell's" sent to the dispenser or consumer with a written label.

Wm. H. Armstrong & Co., of Indianapolis, Ind., have lately put upon the market the "Success Nasal Syringe," an illustration of which is shown above. This instrument possesses distinct advantages which make it a very desirable addition to the methods of treating nasal catarrh. By means of a rubber tube with fine perforations attached to a rubber bulb, the fluid is made to flow in fine jets in all directions, thoroughly covering all diseased portions of the nasal cavities. Dealers who have handled this apparatus say it is one of their best sellers. Write for prices to the trade and detailed description.

The Birney Catarrhal Powder, the Masonic Temple, Chicago, make it a point to see that every druggist who has their goods in stock enjoys a good sale for the same. Send in 50 to 100 names of your customers and they will send them free samples with your compliments. Also send for copy of their beautiful picture, "In Suspense," a free sample of the remedy for yourself, and information regarding other special offers which the firm is making. Mention the Era.

As agents for several of the leading oil manufacturers of Europe, George Luenders & Co., 218 Pearl street, New York, are in a position to quote satisfactory prices and furnish goods of the highest quality. They call particular attention to Heine & Co.'s Synthetic Oil of Mustard in original packages, Lauter Flitz' Almond Oil, sweet and bitter, Pure Olive Oil, and the Carlotta Oil of Rose, all of which they ask the trade to specify in ordering.

The season will soon be at hand when people will be asking for deodorizers and disinfectants. The druggist will be well prepared for such demands who can give his customers Bromo-Chloratum. With every order for three dozen, 500 counter wrappers with retailer's name thereon are furnished, and the public will soon be interested in reading such matter. Send in a list of your physicians and the Bromo Chemical Co., of New Lebanon, N. Y., will send them a sample.

The White Rock Mineral Spring Co., of Waukesha, Wis., have lately received from the patent office a certificate of register of the arbitrary word "Ozonate," as a trade mark for the product of White Rock spring. This, in connection with the representation of "Psyche at Nature's Mirror," which, by the way, they claim is the White Rock spring, on account of its great purity and clearness, will surely give them the most complete protection, and at the same time aid in popularizing this healing water.

Beach & Clarridge, 52-58 Eastern avenue, Boston, refer to themselves as the "fountain head" of soda fountain supplies, from the fact that they handle everything in this line which the dispenser needs, and the quality of their goods is such that one trial usually results in a steady demand. All the fruit juices and extracts are manufactured by this firm, and they are also American agents for a great number of foreign specialties, essential oils, etc. Write for catalogue and prices.

The firm of Clough & Macconnell, 132 Nassau street, New York, has by mutual consent dissolved co-partnership, and through an amicable arrangement, divided its business into two distinct branches. Dating from January 1st, 1894, William R. Clough becomes sole proprietor of their Wire Corkscrew Patents and Trade, and will continue the manufacture at Alton, New Hampshire, under the trade name of "The Clough Wire Corkscrew Co.," and James M. Macconnell becomes the sole proprietor of their Decorated, Folding Corkscrew Patents and Trade, and will continue the manufacture at 132 Nassau street, New York.

Remember that all the indexes for this issue will be found upon first four red sheets.

If you desire to retain the esteem of your physicians you must display a willingness to keep posted on all the improvements which are constantly being made in pharmacy. "Koneals" are offered by J. M. Grosvenor & Co., 105 Milk street, Boston, as an improvement over capsules, cachets and wafers for dispensing powdered drugs, and every druggist should send for free sample, and description of the closing apparatus. Advertising matter which never fails to interest the physician will also be sent.

Over six thousand "Star" Ice Shavers manufactured by D. H. Bates & Bro., Dayton, Ohio, are now in use, which fact certainly speaks well for the merits of these machines. They are made of brass, to prevent rusting, are nickel-plated throughout, of handsome design, and the economy in using shaved ice at the soda fountain is so great as to pay for one in a very short time. Each machine is mounted on a marble slab 8 by 14 inches, and makes a handsome ornament in connection with the soda water outfit. Write for detailed description and prices.

Those who are interested in compressed tablets and their manufacture should write to The Searle & Hereth Co., of Chicago, for cuts and information regarding "The Hereth," for which they are the selling agents. It is an entirely new machine, and they claim for it superiority in strength, simplicity and ease of adjustment. If you happen to be in Chicago it will pay you to see it. They have several in operation and refer buyers to others who are using the machine. This firm is a growing one, and visitors to their laboratory are always cordially welcomed.

Nearly all the medicaments which can be exhibited in pillular form can be exhibited quite as readily in cachets, and when the satisfaction of the patient and the convenience of the dispenser are considered there is found to be a strong argument in favor of the employment of the latter. The cachets and filling apparatus of S. Chapreau, of Paris, are giving great satisfaction with pharmacists who have adopted this new method of dispensing drugs in powder form, and those who are unacquainted with these pharmaceutical adjuncts should send for price list and free samples to the American agents, Utard & Co., 3 Union Square, New York.

There are different opinions held by members of the medical profession as to the best temperature at which to sterilize milk, etc., some claiming that the boiling point induces chemical changes which do not favor a condition of perfect nutrition, and advocating a lower temperature, while others adhere to the theory that safety lies in the employment of a temperature of 212 degrees. To meet all these varying requirements Wilmot, Castle & Co., of Rochester, N. Y., have lately made some improvements in the Arnold Steam Sterilizers which adapt them for either high temperature (sterilizing) or low temperature (pasteurizing). This is effected by perforating the inner covers so that leaving off the hood allows sufficient steam to escape to reduce the temperature to 160 or 170 degrees Fahrenheit, while putting the hood on raises the temperature to the boiling point. Write for circular describing this improvement and mention the Era.

While it has been believed for some time that the cresols were much stronger antiseptics and less poisonous than carbolic acid, the fact that they were insoluble in water in their crude form, and the means of rendering them soluble were objectionable, has always militated against their use. Schering has, however, isolated the three cresols, ortho, meta and para, and their mixture has been introduced under the name of "Trioresol," which consists of a water-white, clear liquid, sp. gr. 1.042-1.049, soluble in the proportion of 2 1/2 parts to 100 of water. Full information regarding this preparation may be obtained by addressing the American agents, Schering & Glatz, 55 Maiden Lane, New York.

"Eae only one drop" is the taking injunction which appears upon a strip label around the neck of the bottle containing Hoyt's Perfection perfume manufactured by F. Hoyt & Co., Philadelphia, Pa. This plea for economy which can be properly made on account of the concentration of the odor, and the fact that it is put up in bottles with sprinkler tops, is making this exquisite perfume a quick seller, and dealers will do well to include a sample order for these goods when ordering of their jobbers. In this connection it becomes quite pertinent to ask the trade if they have seen the elegant picture which this firm are sending out to advertise Hoyt's "Dime" and German Cologne. It is an exceedingly fine example of the lithographer's art, and is bringing the firm many admiring comments. It consists of a beautiful landscape in colors, surrounded by butterflies whose bodies are bottles of Hoyt's German Cologne, with wings in natural colors and gold. Every druggist should send for a copy of this beautiful picture, and then prepare for the demand which it is sure to create.

A citrate of magnesia bottle which admits of being opened and closed again without serious detriment to the medicinal qualities of this preparation, is certainly an improvement which will catch the attention of all druggists. Such a bottle is shown in the illustration above, and it is manufactured by the Saltsburg Bottle Works, Saltsburg, Pa. See prices upon this new bottle in advertisement on another page, and in calculating upon the expediency of laying in a stock, be sure to include the satisfaction of customers, which will form quite an item on the profit side of the transaction.

The Upjohn Pill & Granule Co., Kalamazoo, make a specialty of pills under an improved process and the fact that they can make the claim of being the largest exclusive pill manufacturers in the world shows that there is merit in their goods. Every druggist should have their list, which includes over 500 kinds of pills, which they keep constantly in stock.

Kefr Kumyss, in cases of 6 and 12 quart bottles at \$4 per dozen, less 15 per cent to the trade, are the figures which R. E. Rhode, 504 N. Clark street, Chicago, quotes on his product. Kumyss is daily finding an increasing field of usefulness in the hands of the medical profession, and its popularity as a beverage is also extending. Many druggists are finding it a profitable article to handle.

McKesson & Robbins, of New York, present some figures in this issue on their Pure Fruit Juices which may well engage the attention of those about to lay in a stock of such goods for the summer trade. The advantages claimed for these juices are that they are made from fresh fruit, contain no artificial flavoring, retain their flavor indefinitely, and do not ferment nor change—in fact, they are just the kind of goods one would expect from an old, well-established firm like McKesson & Robbins.

The original and artistic design which characterize the white wire work of the Philadelphia Ornamental Wire Co., 18 North Sixth street, Philadelphia, have rendered the goods of this firm very popular with manufacturers and druggists who desire something attractive in the way of display stands, etc., for pharmaceutical preparations and novelties. This is shown by the fact that the Bromo Drug Co., of Baltimore, recently placed a large order with this firm for display stands. Write for estimates on goods of this kind made to order.

From the fact that the manufacture of Peroxide of Hydrogen is accomplished by a complicated process, there has always been a great variance in the products of the different manufacturers. Now that a standard has been given by the U. S. P., 1890, the manufacturers of this product know exactly what is required of them. Larkin & Scheffer, St. Louis, Mo., call the attention of the drug trade to their product as fulfilling all the requirements of the tests given, and invite a trial of their goods on the part of those who desire "an ideally perfect product."

THERE MUST BE A DEMAND FOR IT.

Mr. R. Matchett, Esq.: Dear Sir—We testify, with pleasure, to the fact that the "Four-Fold Liniment" is the leading liniment in our sales. It has had less advertising than any other liniment we handle, and yet steadily increases in sale. From personal knowledge of its merits, we recommend its general introduction.

Yours truly,

GEO. A. KELLY & CO.,

Wholesale druggists, corner First avenue and Wood street, Pittsburgh, Pa.

We sell more of your "Four-Fold Liniment" than any other, and probably more than all others combined. In our opinion, it has merits to hold its own wherever introduced.

A. C. HENDERSON & SON, Wholesale druggists, 50 Seventh avenue, Pittsburgh, Pa.

The Parfumerie Delletrez has just issued a price list of the perfumes and soaps carried in stock at the American office, 41 and 43 Warren street, New York. As soon as the Wilson bill is passed, Delletrez will issue a new list with prices according to the new tariff. The prices of the list are all net, but they allow a discount of 10 per cent to all customers who purchase \$300 worth of goods in one year. Amaryllis du Japon, their leading odor, is extensively advertised, and should be found in the stock of every enterprising druggist.

A. D. Puffer & Sons, 38 to 48 Portland street, Boston, recognize the fact that silver and the tariff have had a great deal to do in unsettling the financial affairs of the country, but they are also alive to the greater fact that prices must be graded to suit hard times, and this they have done. They believe that a large soda water business is to be done this summer and they propose to be one of the parties engaged in it. Their new illustrated catalogue shows to some extent how they are going to do this, and their prices tell the rest.

The Hero Fruit Jar Co., of Philadelphia, announce that they have at last found a bottle stopper which will prevent the refilling of bottles—one that will actually do the work. This new contrivance has been brought out so recently that they haven't had time to have cuts made and a description written, but they will undoubtedly be in readiness to answer the questions of all interested parties by the time this announcement gets well distributed to the trade. If you are interested, write them. They will send a sample free of charge.

The Clinton Pharmaceutical Company, of Syracuse, N. Y., are introducing a new appliance which is meeting with considerable success in the hands of the medical profession. It consists of the Standard Powder Blower, which is especially adapted for Intra-Uterine and Intra-Urethral powder medication. Call the attention of your physicians to the above illustration.

A consideration of the question of where to obtain a pharmaceutical education should embrace a careful study of the advantages offered by the Philadelphia College of Pharmacy. This school was organized in 1821 and its alumni include many of the most prominent men in American pharmacy. Write for announcements to Thomas S. Wiesand, 145 North Tenth street, Philadelphia.

John Phillips & Co.'s advertisement in this issue gives a very good idea of what their "Silent Salesman" is like. He shows the goods (goods well shown are half sold) while you take in the money. Everything manufactured by this firm in the way of store fixtures, fountain tops, etc., has some distinctive feature to recommend it, and every druggist who is figuring on improvements should get an estimate from John Phillips & Co., Detroit, Mich.

PLAYING CARDS.

You can obtain a pack of best quality playing cards by sending fifteen cents in postage to P. S. Eastis, Gen'l Pass. Agt., C., B. & Q. R. R., Chicago, Ill.

NEW HYDROMETERS.

Whitall, Tatum & Co. have recently gotten out a new line of hydrometers for commercial and laboratory use. They are made with all the care that W. T. & Co. are known to give to their graduated work, and are all ballasted with mercury, and the scales so accurately adjusted that the instruments compare favorably with others usually sold at much higher prices.

Their present list includes a variety of instruments with Baumé scales for both light and heavy liquids, four alcoholometers, two with and two without thermometer, and a series for special uses based in most cases on the Baumé scales.

As is well known, Baumé's hydrometers are more largely used than any other, in spite of the fact that the scales are entirely arbitrary, and often confusing because of the same figures being used above 10 degrees for both light and heavy liquids.

Several authorities have recommended the use of hydrometers with arbitrary scales, such as Baumé's, Balling's, Long's, etc., in favor of the more rational and simpler specific gravity scale, but users have become so accustomed to one or another of the old forms that it will doubtless be extremely difficult to bring about a reform.

For the convenience of those using their hydrometers, however, W. T. & Co. supply with each instrument a table showing the equivalents of Baumé and specific gravity degrees. They also announce that they are looking

towards getting out a line of hydrometers with both Baumé and specific gravity scales on one instrument, after the plan of their popular duplex graduates, such a series of hydrometers would no doubt prove acceptable and convenient, and would enable users of hydrometers to become acquainted with the specific gravity scale, as the duplex graduate has familiarized many with metric fluid measures.

The Welch Grape Juice Co., of Vine-land, N. J., are, of course, reasonably anxious to have the drug trade handle their unfermented grape juice; but they ask no one to buy it before testing it, and to have this done they will send every druggist who will write to them a sample two-ounce bottle free of charge. They will also, probably, send with the bottle some information about the use of their grape juice in soda water dispensing.

If you have been waiting for an opportunity to discard your old scales and purchase new ones at a decided bargain, read the advertisement of Robt. Stevenson & Co., of Chicago. In this issue they offer a Dearborn Box Prescription Scale with coin, grain and dram weights and one pair extra adjusted glass scale pans, and the Dearborn Counter Scale with set brass block weights, $\frac{1}{4}$ ounce to 1 pound, all boxed in shipping order, for \$20. This may be the opportunity you have been looking for.

Bell-Cap-Sic Plasters and Kremlin Cream are two winners, because they are made right, sold right and advertised right. The oleographs of "The Pupples" never fail to call attention to the plasters, and the result is a steady demand for them ever afterwards. Kremlin Cream is advertised in all the magazines, has been well sampled, and the public is beginning to call for it. Druggists who desire sample of this dentrifice will receive one free upon application to J. M. Grosvenor & Co., 105 Milk street, Boston.

The California Fig Syrup Co. claim that the point which the enterprising druggist should consider is the volume of profits, and they believe in making the percentage large enough to insure favorable results to the retailer. The advertising on their product is to be largely increased during 1894, which is equivalent to money in the druggist's pocket, and they ask the co-operation of the trade in extending the sale of their preparation, which will result in benefit to both the manufacturers and the dealers.

The physicians of this country as a rule, are already quite well posted on the merits of Panopteon, the bread and beef peptone, manufactured by Fairchild Bros. & Foster, New York. They naturally look to the drug trade to supply their demands. Do you keep it in stock? Panopteon is made of the entire edible substance of prime lean beef and best wheat flour, thoroughly cooked, sterilised and concentrated, and is an excellent food in all cases where a quickly assimilable and comprehensive nutriment is required.

The economy of manufacturing in large quantities finds a striking illustration in the popular Tanglefoot. When the price was reduced last year to \$3 75 per case, it was thought that the lowest possible limit had been reached, that the cost of production had been reduced to a minimum. A few years ago the crude material entering into a case of Tanglefoot would have cost as much. Yet the immense output of last year which exceeded anything ever done before, accomplished another saving, which as usual goes to the retailer to help to still further increase the demand. The prices this year will be: 40 cents per box, \$3 60 per case (ten boxes), \$3 50 per case in five-case lots, \$3 40 per case in ten-case lots.

CROWN LAVENDER SALTS.

In the great hospitals of the world's cities, where are gathered daily the suffering and the stricken, and where the tragedy of life and death always enacting never ceases, the human heart can perhaps be best seen in its full plain nakedness and its true simplicity. There is the realm of trifles, where the little things of life ordinarily unnoticed, assume an exaggerated importance, and the great events of the world outside meet with but languid interest. The entrance of a butterfly into the long cot-lined ward, bearing its message of outside life, sunlight and nature, will bring more happy smiles on pale wan lips than any message that might flash a nation to rejoicing.

Nurses know this, and the quiet, softly-voiced women who glide so noiselessly around the halls of pain have many a tale of joy and sorrow, mirth and pathos that has come from some mere trifle. Doctors, too, have seen the magic of the trifle and know its potency for good or ill. One of these, an Englishman, on the staff of a great London hospital who, recently discussing this subject, cited an example that may point the case. "About three years ago," said he, "a poor fellow was brought in who had been run over by a heavy truck. He was horribly mangled and amputation of both legs was absolutely necessary to save his life. This, of course, meant that he was hopelessly crippled for life even if he recovered, which, as he was suffering greatly from the shock was doubtful. He submitted to it, however, with the fortitude of the highest courage, and slowly day by day began to improve. In some manner, as the days of his convalescence stretched along, he became possessed of about a half bottle of Lavender Salts. The invigorating perfume seemed to enchant him and for days he was like a child with a sweetmeat, holding it for hours and occasionally taking little saving sniffs. Despite all his care, however, the virtuously departed, and his sorrow was such that I really began to have serious fears of its effects on him. He was a poor man and could not buy more, but one day he got the nurse to give him paper and pen, and wrote to the Crown Perfumery Company in Bond Street, telling how he had enjoyed the Lavender Salts and that he was too poor to buy more. It was as pathetic a testimonial, I think, as any firm ever got, and its answer the next day was a generous one, the firm sending him one of their largest jars. Eventually he recovered, but had it not been for the happiness brought by so small a thing as a bottle of Lavender Salts I feel sure that medicine and care would alike have failed to keep him alive."

Nothing does so much to discourage the free use of paint by the public as the sale of inferior goods. People cannot afford to paint buildings every two or three years with poor paint, so they let them go with a shabby appearance. Thus the dealer sells no more of such paint than he does of a good article. In buying white lead the dealer should make it a point to buy of a firm which cannot afford to put an inferior article on the market, and the Eagle White Lead Co., of Cincinnati, Ohio, claim to be just that kind of a firm. See list of agencies in their advertisement in this issue, and remember the Eagle brand when ordering.

T. D. WEST.

T. D. West, of Atlanta, Ga., is a gentleman well known to the druggists of Georgia and the drug trade of the south as a popular and successful traveling salesman. He has until recently been connected with the Lamar & Rankin Drug Company, of Atlanta. Mr. West was for many years a prominent druggist of Florida, and was one of the charter members of the Florida Pharmaceutical Association. He emigrated from Florida and located in Dallas, Tex., engaging in the proprietary medicine business. This venture proving somewhat unprofitable, Mr. West removed to Birmingham, Ala., and again engaged in the retail drug business, where he remained until, attracted by the thrift and enterprise of Atlanta, he concluded to cast his fortune there. Mr. West is a gentleman of intelligence and refinement, of high personal character, and enjoys the confidence and esteem of a large circle of friends.

BARONMORE, 2:17 $\frac{1}{2}$

Mr. D. C. Palmeter, of Chicago, owner of "Baronmore, 2:17 $\frac{1}{2}$," the fastest three-year-old in Wisconsin, writes as follows: "I have given Quinn's Ointment a thorough trial and it has proven a great success. Does even more than claimed." For curbs, splints, spavins, windpuffs and bunches use this wonderful remedy. Quinn's Ointment is endorsed by the leading breeders from Maine to California. It will pay all druggists to carry it in stock, and if you desire advertising or will send the names of ten or twelve of your customers, who are in the horse breeding line, to Messrs. W. B. Eddy & Co., Whitehall, N. Y., they will forward them, without charge, trial packages.

THE PLACE TO DINE IN NEW YORK CITY.

Business men visiting New York City are beginning to find out that one of the cosiest places to get a good dinner, with everything of the best, is the old restaurant, formerly Heckman's, now called the "Century," at No. 122 William street, in the center of the drug district, which has changed hands and is now run in first-class style by one of the best caterers in the city. There has been a restaurant in this building (the oldest in the city) as far back as the memory of the oldest inhabitant can run. Many of the leading business men, who are particular regarding their meals, may be seen regularly at this old hostelry.

There is quite a popular demand for proprietary homeopathic remedies, and many druggists have been successful in building up a good trade in such preparations. The Munyon Homeopathic Home Remedy Co., of 1505 Arch street, Philadelphia, make an offer in their advertisement in this issue, which is worthy the attention of those who wish to handle such medicines. An elegant cabinet containing a \$42 assorted stock of Munyon's Remedies is furnished at a discount of 40 per cent and liberal time is allowed for payment. A handsome clock goes with the case, and 500 "Guides to Health" with retailer's imprint are furnished with every order.

The Iron and Manufacturing Co., 22 Cliff street, New York, have good grounds for calling attention to the valuable points in their steel soda fountains from the fact that the great demand for them since their introduction has put the company in a position where they can properly claim to be the largest manufacturers of steel fountains in the world. Safety and durability are the two features which have won for them this position, and they have been secured by unique methods of construction, which makes the soda water manufacturer feel at ease while using their apparatus. Write for prices, terms and full description if you are in the soda water business.

The application of electricity to heating has long been regarded as feasible, but the practical part of the operation has been mostly confined to the columns of magazines and scientific journals. Queen & Co., of Philadelphia, have, however, solved the problem, and are now in a position to supply what they call the "Electric Hot Plate." It can be used on any electric light wire which may be in the house, and by its use water may be quickly boiled. It is particularly convenient in laboratory work in boiling and distilling inflammable liquids and vapors. It also makes a valuable household utensil. Write for prices and detailed information, and mention the Era.

The benefit to dealers in sending for printed matter is evidenced in the following letters:

Orrville, Ohio, December 15th, 1893.
Yellow Pine Extract Co.:
Gentlemen—Enclosed please find money order for price of one bottle Yellow Pine Compound for rheumatism. Send same to H. G. Moore, Marshallville, O. We hope to be able to send an order for more. Yours truly,

NAFTZGER & CO.
Again under date of December 15th, 1893, they write: "It seems as though your circulars, etc., are going to bring the answers. The party for whom we got the medicine is helped, and this is a good advertisement. Send us ¼ dozen at once, also the order of this morning as directed." And on December 18th, 1893, they write: "Please find enclosed money order for bill December 16th, also list of sufferers. Please send letters signed. Naftzger & Co."

To any dealer who will send for same, we will mail printed matter and blanks for names of sufferers from rheumatism, whose trade we will work up for dealers. Yellow Pine Compound finds a ready sale at \$2. \$18 per dozen, 6 per cent off for cash with order. Sold by Yellow Pine Extract Co., Allegheny, Pa.

The 1894 catalogue which the Low Art Tile Company, 552 Broadway, Chelsea, Mass., is distributing, is an elegant publication, from the press of the Heliotype Printing Company, of Boston, and while representing but a limited number of the styles and sizes made by the Low Company, those which are shown are the average sizes that are principally used, and the catalogue will therefore be of service to the average dealer in making a selection of apparatus. The illustrations are printed in colors which give a good idea of the artistic effects which can be obtained by using tiles for soda fountain construction. If you contemplate any change in your soda water business you should have this catalogue.

There are five points to be considered in connection with the product of the Silurian Mineral Spring, of Waukesha, Wis. First is the undoubted purity of the water; second, the medicinal qualities which make it an ideal alterative, diuretic and laxative; third, the combination of the water with wild cherry and acid phosphates, under the name of Silurian Wild Cherry Phosphate, for use as a beverage; fourth, the Silurian Wild Cherry Phosphate Syrup for serving at the soda fountain; fifth, the prices at which these goods are sold so that the retailer is enabled to realize a good profit. Write for sample of the syrup for soda fountain use and the new 64-page catalogue of the company.

The season is fast approaching when the public will be asking for tonics, and it is with this knowledge in mind that F. Stearns & Co., of Detroit, Mich., call the attention of the trade to several articles in this line, each possessing characteristic remedial properties of its own. Stearns' Wine of Cod Liver Oil, combining the active medicinal constituents of the oil with peptonate of iron and wine, is the ideal recuperative tonic. Stearns' "Hæmoferrium," the true blood iron, asymptotically prepared from fresh bullock's blood, forms an excellent chalybeate tonic. Cascara Aromatic (Stearns') is a tonic laxative of acknowledged value, and Kola Cordial is offered as an unexcelled nerve tonic. With an assortment of these goods upon his shelves the retail druggist will be able to meet any demand that may arise for a tonic.

Druggists will find many special offers to introduce goods, but it is rare that so liberal an offer is made as that of McClellan & Patton in this issue of the Era (also January 15 number, page 53) to introduce Dr. Patton's Headache Specific. The firm have many proofs of the satisfaction which this preparation is giving, and dealers who handle it find a steadily increasing sale. The inducement which they offer in connection with these goods is to send a rolled gold watch, free, with an order for two gross, and either a solid silver watch or the "Era Formulary" with an order for one gross. The benefit of this offer can only be obtained by accepting it at once, as the supply of watches is limited. The firm can secure any number of reasonably good watches to extend this offer indefinitely, but the particular watch they are offering came to them as an unusual bargain, and cannot be duplicated for double the money. Dr. Patton's Headache Specific pays 100 per cent clear profit, and the watches or Formulary are simply offered

as an incentive to push their goods. The offer is worthy of serious consideration.

Joseph Fleming & Son, wholesale druggists, 412 Market street, Pittsburg, Pa., call attention to two brands of pure whiskey, both of which possess medicinal qualities which should engage the attention of the drug trade. Fleming's Old Export Whiskey is manufactured by one of the largest distilleries in Western Pennsylvania and exported to Hamburg, Germany, after remaining in U. S. bonded warehouse for three years, and shipped back to this country after being thoroughly matured. Fleming's Pure Malt is offered as an article which will attract the attention of physicians on account of its maturity and purity. With each order for one dozen of either of these brands, a dozen miniature samples are furnished for free distribution. These samples never fail to bring customers, and the dozen samples may be counted on to sell a dozen bottles.

A NEW VAGINAL SYRINGE.

The "Pri-mo" Ladies' Syringe lately put upon the market by E. J. Hussey & Co., 80 John street, New York City, is a strictly high grade instrument and is put up in a very attractive way. Its merit lies in the peculiar construction of the nozzle and shield. The nozzle being anatomically correct in its design, and of superior finish, is both comfortable and efficient, and is in no sense a wedge. The shield is an improvement upon all others heretofore presented, and is provided with a soft rubber cushion which makes it fit snugly about the parts, and forms a perfect occlusion. It is stated that water 20 degrees hotter may be used with this syringe than with any other. The "Pri-mo" Nozzle and Shield may be used with any fountain or bulb syringe.

They are furnished in two outfits, viz.: No. 1, which is shown in the engraving, contains nozzle and shield, packed with 4 feet (1-4 inch) outlet tubing, and No. 2 containing nozzle and shield, packed with a two-quart fountain bag, tubing, infant and rectal pipes, complete.

Each outfit is packed in a polished cherry wood box, which is lined with enameled waterproof paper. Send for an illustrated pamphlet telling all about the "Pri-mo" Ladies' Syringe.

John Phillips & Co. have been awarded the contract for fitting up the new wholesale drug establishment of Farrand, Williams & Clark, Detroit. This includes all inside fixtures, such as wall cases, shelving, counters, show-cases, etc.

MAGAZINES.

The following is a brief mention of the important features of the March magazines.

The North American Review is well in line with articles upon the leading topics of the day. Secretary of the Navy Herbert writes of the "House of Representatives and the House of Commons" in a way which leads to the belief in the superiority of the former in legislative matters. Sarah Grand, authoress of "The Heavenly Twins," writes of a "New Aspect of the Woman Question." Hon. E. T. Chamberlain in "A Present Chance for American Shipping," calls attention to our antiquated navigation laws, which discourage American enterprise. Archibald Forbes writes upon "The Outlook for War in Europe." Gov. Greenhalge, of Massachusetts, writes of "A Conference of New England Governors." Major Arthur Griffiths writes of "Prisons in the Old World and New" and Bram Stoker furnishes an article on "Dramatic Criticism." Prof. Richard T. Ely has written an able article upon "Natural Monopolies and the Workingman," which is quite in accord with some of the thinking which is being done at present upon the question of government ownership of some great industries. "River and Harbor Improvement" forms the subject of an article by Chairman Blanchard, of the committee on rivers and harbors, and Major Sir George Sydenham Clarke crosses swords with Andrew Carnegie on the question of "A Naval Union with Great Britain."

The Ladies' Home Journal presents a view of Nathaniel Hawthorne, as seen by his youngest daughter, in an article entitled "My Father's Literary Methods." Rev. Lyman Abbott handles the church choir in a masterly manner; Stockton carries "Pomona" still further abroad in her travels, and Howells is as entertaining as ever in his "Literary Passions." "The Art of Dressing a Bride," "Early Spring Bonnets," "Early Spring Gowns," "Colors and Materials for Spring," "The First Spring Sewing," "The Etiquette of Flowers," present an array of topics which cannot help but please the feminine mind. Eben E. Rexford tells about "Making and Caring for a Lawn," Miss Scovill gives counsel on "What to do in Emergencies," and the poetry of the number is contributed by Eugene Field, Harry Romaine and Charles B. Going.

St. Nicholas presents an array which will receive attention from its readers in its minutest detail. "Owney of the Mail Bags" describes a small dog who has traveled all over the United States in mail cars. Under the head of "Historic Dwarfs," Joseph Boruwiaski's history is presented by Mary S. Roberts; "A Man-of-War's Menagerie," by Don C. Seltz, describes the sailors' pets aboard the U. S. steamship San Francisco; Gustave Kobbe tells of "A Boy Whaler;" Philip Atkinson gives "A Lesson in Electricity" and Lida M. Tulloch gives "The History of a Dagger." W. T. Hornaday writes of "The Cat Family in Our Country;" John M. Steele describes a "Kansas Cyclone;" Dr. Eastman continues his "Stories of a Wild Life" and Mark Twain has some further adventures of "Tom Sawyer Abroad" to relate. The "Brownies" are presented in a play by Palmer Cox, and the first act, which appears in this number, promises much entertainment to the friends of these quaint little creatures.

The Atlantic contains the concluding chapters of "His Vanished Star," by Chas. Egbert Craddock, which will shortly appear in book form. "Two Strings to His Bow," by Walter Mitchell, is also concluded in this number. "The Fore-loam Rug," a New England tale, by Kate Douglas Wiggin, and the third installment of Mrs. Deland's "Philip and His Wife" are the other fiction features of the number. Bradford Torrey writes "On the Upper St. John;" Edith Brown on the question "Is the Musical Idea Masculine?" Archibald Lampman, "The City of the End of Things;" Jeremiah W. Jenks, "A Greek Prime Minister, Charilaos Tricoupolo;" Maurice Thompson, "The Sapphic Secret" and Nicholas Murray Butler on "The Reform of Secondary Education in the United States."

Lippincott's has for the complete novel, "A Desert Claim," by Mary E. Stickney. Other articles of interest are "A Prophet of the New Womanhood," by Anne Nathan Meyer; "The Inmate of the Dungeon," by W. C. Morrow; "The Training of the Saddle Horse," by John Gilmer Speed; "More About Captain Keed," by Emma H. Ferguson; "Bees and Buckwheat," by Charles C. Abbott; "The Late Mr. Watkins of Georgia," by Joel Chandler Harris; "The Evolution of Public Roads," by Charles McIvaline; Installments of "The Trespasser," by Gilbert Parker, and "Talks with the Trade—Literary Mendicancy."

Popular Science Monthly has for its initial article an argument to "Abolish All Prohibitive Liquor Laws," by Apollon Morgan. He denounces all such laws as ineffectual and actually standing in the way of better remedies for intemperance. Frederic Houssay writes of "Industry of Animals;" Prof. J. Mark Baldwin gives the result of some experiments to determine the "Origin of Right-Handedness," and John G. Rothermel writes of "Fossil Man." Other articles of importance are "Professor Tyndall," by Prof. T. H. Huxley; "The European Law of Torture" by A. W. Barber; "Customs and Superstitions of the Mayas," by Mrs. A. D. Le Plongeon; "Biology and Ethics," by Sir James C. Browne, M. D.; "The Action of Massage Upon the Muscles," by D. Graham, M. D.; "The Ice Age and Its Work," by A. K. Wallace; "The Founder of the First Scientific Journal," and "Sketch of Jean Martin Charcot."

The Century has for its opening article a sketch of the "Tulleries under the Second Empire," which is accompanied by portraits of Napoleon III., Eugenie and the Prince Imperial, that of Eugenie appearing as a frontispiece. The table of contents includes "The Great Sympathetic Strike," by Charles B. Davis; "Old Dutch Masters—Gerard Dou," by Timothy Cole; "The Fortunate One," by Harriet Monto; "A Pilgrimage to Lourdes," by Stephen Bonsal; "The Timber Cruiser," by Julius Chambers; "Drowsy Kent," by Charles De Kay; "Mayor Andre's Story of the Mischianza," an unpublished manuscript by Major Andre, with preface by Sophie Howard Ward; "Isam and the Major," by Harry S. Edwards; "We Camped with Burns," by Wm. P. Foster; "Edward Grieg," by Wm. Mason; "The City Tramp," by Josiah Flynt; "The Imagination," by James Russell Lowell; "Coeur d'Alene," by Mary Hallock Foote; "The Madison Square Garden," by Mrs. Schuyler Van Rensselaer; "Philip Kearny," a personal tribute, by Philippe, Comte de

Paris; "Earthquakes, How to Measure Them," by Edward S. Holden; "The Courting of Jufrow van Loo," by Anna Eichberg King; "The Suppression of Bribery in England," by Jeremiah W. Jenks; "The Anti-Catholic Crusade," by Rev. Washington Gladden, and "Pudd'nhead Wilson," by Mark Twain.

Outing is as usual a finely illustrated number and the table of contents discloses the following: "The Pakiglaccio's Courtship," a story of Italian peasant life by Jean Porter Itudd; "Modern Cannon-Building for Amateurs," by Henry L. Strohbridge; "The Rise of the Bottom Itall," a story of the south, by John A. Williams, Jr.; "A Leopard Hunt in Ceylon," by E. Fitzroy Dixon; "Duck Shooting in a City," by Herman Rave; "Hooting at Yale and Harvard," by J. Ralph Finlay; "In Aztec Land Aweh," by T. Philip Terry; "The Boston Terrier," by Chas. F. Leland; "Climbing in the Alps," by Charles E. Thomson; "The First Corps Cadets, M. V. M.," by Arthur L. Spring; "The History of Cross-Country Running in America," by E. H. Baynes; and "Graining the Tarpon," by Willis B. Hobbs.

Hartmann & Hauers, of Hanover, Germany, announce that they have transferred their entire output of Beechwood Creosote in the United States to Merck & Co., of New York, and that the same will hereafter be furnished to the trade under the label and seal of the latter firm. It is claimed that many spurious articles have crept into use bearing imitations of the "H. & H." brand under the previous arrangements, and the change in methods of bringing it to the trade will do much to insure to the medical and pharmaceutical professions a reliable source of supply. When ordering specify Beechwood Creosote-Merck.

We are the recipients of a decided novelty in the shape of an aluminum comb sent us by the American agents, Wm. L. Strauss & Co., 27 Warren street, New York City. They claim, and we must say that the appearance of the comb bears them out, that they compare favorably in price with the best quality of horn or rubber combs. In fact, many grades of hard rubber combs are sold at a much higher price. The manufacturers warrant these combs never to break or tarnish, which fact should be appreciated by the trade. They are made in all shapes, ladies' dressing, barbers', etc., and in all sizes.

On March 7th, A. Kiefer & Co., of Indianapolis, became the A. Kiefer Drug Co. Mr. A. Schmidt, who has been associated for a number of years with Mr. Kiefer, has withdrawn. The articles of incorporation filed by the new company show a capital stock of \$250,000, all paid in. The directors are A. Kiefer, Chas. Mayer and Chas. McBride. We are informed that Mr. Schmidt is a candidate for County Treasurer.

No matter if you think you have reached bed rock in the matter of buying folding boxes, Jesse Jones & Co., 635-6th Commerce st., Philadelphia, claim it will pay you to look up the "J. J. Box." They will be pleased to send you samples and quotations. They like competition, as it has brought up their boxes to the present high standard, and they will quote prices with the full knowledge that they are to be compared with those of their competitors.

BOOK REVIEWS.

***LECTURES ON AUTO-INTOXICATION IN DISEASE, OR SELF-POISONING OF THE INDIVIDUAL.**—This is a translation of a work by Bouchard, and deals with subjects of every-day interest to the physician. These lectures may be regarded as an inquiry into the operation of poisons introduced from without or generated within the body of man and the part they play in health and disease. From the fact that death frequently carries off in a few hours or days individuals who are in the prime of life and in apparent good health, and at whose post-mortem no change in structure can be found to explain the fatality, the attention of the medical profession has lately been strongly directed toward an investigation of putrefactive processes in the intestinal canal, and the development of physiological and pathological alkaloids within the body. This work will therefore be a valuable addition to the library of those who are disposed to investigate this important subject.

ANNUAL REPORT OF THE BOARD OF REGENTS OF THE SMITHSONIAN INSTITUTION.—Published by the government, Washington, D. C. This report shows the operations, expenditures and condition of the institution to July, 1891. Aside from the statistical information the work contains many valuable papers, among which are "Some Possibilities of Economic Botany," by George L. Goodale; "Navajo Dye Stuffs," by Washington Matthews; "The Evolution of Commerce," by Gardner Hubbard; "The Relation of Natural Science to Art," by E. du Bois-Reymond; "The Flow of Solids," by William Hallock; "The General Circulation of the Atmosphere," by Werner von Siemens, and many others of scientific interest.

***A COMPEND OF PHARMACY.**—A fourth revised edition of this popular quiz compend is now offered, which embraces the essential features of the new pharmacopoeia and retains those of the third edition, which included comparative tables of weights and measures, furnished by the United States coast and geodetic survey. Special attention is given to familiarizing the student with the metric system, and the work will be found a valuable one for those who desire a book of this character.

PROCEEDINGS OF THE TWELFTH ANNUAL MEETING OF THE VIRGINIA PHARMACEUTICAL ASSOCIATION, held at Blue Ridge Springs, Va., September 13 and 14, 1893. Aside from routine matters and statistics showing the prosperity of the association, the report contains a very valuable paper entitled "A Few Facts and Points about Quinine gathered here and there and strung together by Robert Brydon."

***Lectures on Auto-intoxication in Disease, or Self-Poisoning of the Individual.**—By Ch. Bouchard, Professor of Pathology and Therapeutics, member Academy of Medicine, Paris. Translated by Thomas Oliver, Professor of Physiology, University of Durham, physician to Royal Infirmary, Newcastle-on-Tyne, England. Cloth, 302 pages, \$1.75 net. Philadelphia, The F. A. Davis Co., 1914-1916 Cherry st.

***A Compend of Pharmacy.**—Fourth revised edition, based upon Remington's "Text-Book of Pharmacy," and the U. S. P., 1890. By F. E. Stewart, M. D., Ph. G., Jefferson Medical College, Philadelphia. Cloth, 181 pages, 81. Philadelphia, P. Blakiston, Son & Co.

PROCEEDINGS, 1893, OF THE MASSACHUSETTS STATE PHARMACEUTICAL ASSOCIATION, held at Atlantic House, Nantasket Beach, June 29, 21 and 22, 1893. This report is quite a creditable one, showing that the pharmacists of Massachusetts take a lively interest in matters pertaining to their welfare. Among the papers presented is one on "Quinine Tannate," by Fred T. Drake, Ph. G., Stoneham, Mass., and considerable space has been devoted to extracts from the state law bearing upon pharmacy and decisions of the Supreme Court relating to druggists and apothecaries.

LONGEVITY.—Some of the means of attaining this desirable condition are ably discussed by Archer Atkinson, M. D., 210 Maryland ave., Baltimore. He gives a list of over 250 persons who have lived over one hundred years, and his treatment of the subject will be of interest to all students of natural history, physiology and biology. Reprinted from Virginia Medical Monthly, February, 1894. For sale by the author. Price, 25 cents per copy.

THE IMPORTANCE OF EMPLOYING ANAESTHESIA IN THE DIAGNOSIS OF INTRA-PELVIC GYNAECOLOGICAL CONDITIONS.—Demonstrated by an analysis of 240 cases, by Hunter Robb, M. D., Associate in Gynaecology Johns Hopkins University, Baltimore, Md.

A NEW SPIGOT ATTACHMENT TO FACILITATE ASEPSIS.—By Hunter Robb, M. D., of Baltimore. Reprinted from the Annals of Surgery, February, 1894.

MAINTENANCE OF AN ASEPTIC TECHNIQUE IN GYNECOLOGICAL OPERATIONS OUTSIDE OF HOSPITALS.—By Hunter Robb, M. D., Baltimore.

IMPORTANCE TO THE SURGEON OF A BACTERIOLOGICAL TRAINING.—By Hunter Robb, M. D., Baltimore.

PATENTS, TRADE-MARKS AND DESIGNS.

PATENTS.

- 514,900—Abdominal Bandage.—Mary Heath, New York, N. Y.
- 514,931—Brown Azo Dye.—Meinhard Hoffmann and Carl Krohn, Feenheim, near Frankfort-on-the-Main, assignors to Leopold Cassella & Co., Frankfort-on-the-Main, Germany.
- 514,952—Apparatus for Spraying Oil or Other Liquids.—Leonard L. Merrifield, Franklin, Mass., assignor to the Economical Gas Apparatus Construction Company, Limited, Toronto, Canada.
- 514,974—Nursing Bottle.—Richard Turck, Ludenscheid, Germany.
- 514,983—Process of Concentrating Sulfuric Acid.—Wilhelm Wolters, Borowitsch, Russia.
- 515,033—Process of Making Citric Acid.—Carl Wehmer, Hanover, Germany.
- 515,038—Method of and Apparatus for Saving fumes of Lead Sulfid.—Eayre O. Bartlett, Joplin, Mo., assignor to the Western Patent Company, Denver, Colo.
- 515,040—Apparatus for the Manufacture of Pigment from Metallic Fumes.—Eayre O. Bartlett, Joplin, Mo.
- 515,041—Method of and Apparatus for Making White Lead Pigment from Lead Fumes.—Eayre O. Bartlett, Joplin, Mo.
- 515,042—Method of Making Sublimed-Lead

- Pigments from Lead Fumes.—Eayre O. Bartlett, Joplin, Mo.
- 515,043—Method of Manufacturing Oxid of Zinc.—Eayre O. Bartlett, Joplin, Mo.
- 515,056—Soda Fountain.—Thomas C. Riley, Boston, Mass.
- 515,057—Soda Fountain.—Thomas C. Riley, Boston, Mass.
- 515,062—Can-Filling Machine.—Henry R. Stetkey, Portland, Maine.
- 515,069—Bottle Cover or Cap.—Antenor Asorati, New York, N. Y.
- 515,077—Product for Oiling Wool.—Ernest Godchaux, La Roche-sur-Chiers, France.
- 515,100—Basic-Yellow Dye.—Arthur Weinberg, Frankfort-on-the-Main, Germany, assignor to Leopold Cassella & Co., same place.
- 515,210—Disinfecting Apparatus.—Benjamin C. Graves, Mount Vernon, N. Y.
- 515,240—Apparatus for Extracting Oil or Fat.—John A. Lighthall, Jr., Syracuse, N. Y.
- 515,283—Can-Filling Machine.—Charles S. Bucklin, Baltimore, Md.
- 515,288—Syringe.—Charles D. Harsin, Stockton, Cal.

PATENTS EXPIRED.

February 29, 1894:

- 157,468—Apparatus for Extracting Tannin.—Thos. W. Johnson, New York, assignor to H. C. Johnson, Astoria, N. Y.
- 157,629—Cigar Lighters.—Julien T. Hill, Brooklyn, assignor to Wm. H. Bailey, New York, N. Y.
- 157,641—Cigar Cutters.—Ernst Kast, Waterbury, Conn., assignor of two-thirds his right to Louis Wenzel and Emil Miller, same place.

TRADE MARKS.

- 24,246—Cigars.—Weeks & Potter Company, Boston, Mass. The words "La Siren."
- 24,249—Chewing Gum.—Faultless Chemical Company, Baltimore, Md. The words "Faultless Chips."
- 24,250—Licorice Lozenges.—Young & Smylle, Brooklyn, N. Y. The representation of three cubical figures bearing the letters "A B C" superimposed upon six similar ones bearing the letters "Blocks." The cubes or blocks are shown as surrounded or placed within a fancy scroll pattern or background and the words "Young & Smylle's Pure Licorice Lozenges" appear in this scroll or background.
- 24,255—Certain Named Toilet Preparations.—R. H. Macy & Co., New York, N. Y. The representation of a five-pointed red star.
- 24,256—Certain Named Remedies.—R. H. Macy & Co., New York, N. Y. The representation of a five-pointed red star.
- 24,257—Remedy for Headache.—The Oak Chemical Company, Philadelphia, Pa. The words "New Heads for Old."
- 24,258—Medical Preparation for Liver Diseases.—J. H. Zeilin & Company, incorporated, Philadelphia, Pa. The words "Liver Regulator."
- 24,259—Remedy for Rheumatism, Gout and Lumbago.—William H. Corbit, New York, N. Y. The word "Hill's."
- 24,262—Perfumery.—Charles Gordon Buck, Chicago, Ill. The word "Jacrose."
- 24,270—Remedy for Lung and Nervous Diseases.—Billings, Clapp & Co., Boston, Mass. The word "Phosphorole."
- 24,271—Remedy for Gonorrhoea.—Scureman Drug Company, Nanticoke, Pa. The representation of a leather pouch.
- 24,275—Preparation of Quinine.—Billings, Clapp & Co., Boston, Mass. The word "Incho-Quinine."

THE MARKETS.

The fluctuations noted in this market report are those affecting goods in original packages and jobbing lots. A complete price list, showing quotations as made by jobbers to retailers, will be found upon another page under the head of "Prices Current."

Advanced.—Caffeine, Cocaine, American Saffron, Ipecac, Balsam Peru, Sal Ammoniac, Vanilla Beans, Cod Liver Oil, Coriander Seed, Senna Tinnevely.

Declined.—Wood Alcohol, Guarana, Oil Bergamot, Balsam Fir, Canada, Sugar of Milk, Nitrate of Silver, Gamboge, Piperazine.

New York, March 8, 1894.

The characteristic features of this market during the past two weeks have been continued jobbing activity in a large variety of articles, an almost entire absence of the speculative element, and a generally steady undertone, with dealers apparently satisfied with the financial condition of affairs. The principal demand has seemed to come from interior distributing points where stocks have not been replenished beyond existing requirements, and as the usually busy spring season is close at hand, it is more than probable that the hand-to-mouth policy of buyers will continue to give the general market an active appearance for an indefinite period. At all events there is little cause for complaint regarding the aggregate volume of business in progress and there is nothing of a discouraging character in the future outlook. The number of fluctuations in values have been rather above the average, but only in a few instances are radical changes to be noted.

OPIMUM.—Has ruled fairly strong up to within the past day or two, when an easier tendency developed with all holders quoting a uniform price. There is, however, some hesitancy to name prices for large parcels, and by some in the trade the present easiness is considered to be only temporary, and, more or less, a part of the programme formulated by the larger operators. The arrivals have been quite heavy and further large shipments are on the way which is the result of efforts to increase holdings before the proposed duty becomes operative. No business of consequence has transpired and even in a jobbing way the demand has been slow.

POWDERED OPIMUM.—Is fairly steady, with limited trading.

QUININE.—Has continued strong, with increased activity and liberal sales are reported for consumption, with both large and small dealers buying freely. The demand for prompt deliveries has been met mainly by second hands, but the agents of foreign manufacturers claim to have booked a considerable number of orders for futures. Cable advices all indicate continued firmness abroad and the general outlook is favorable for improved prices in the near future.

ALCOHOL.—Grain is unchanged and fairly steady with a good consuming demand, while wood has experienced a further drop of 10 cents per gallon as the result of continued keen competition between manufacturers.

CAFFEINE.—Has been advanced.

COCAINE.—Manufacturers have advanced prices.

AMERICAN SAFFRON.—Continues to

harden under a good demand from the consuming trade and a consequent material reduction of available stocks. Offerings are somewhat limited, as a further advance is being considered by the principal holders.

BUTTE LEAVES, SHORT.—Have developed an easier tendency and pressure to sell has resulted in a decline of about $\frac{1}{2}$ cent per pound on all varieties.

HEPACUANHA.—Is decidedly stronger abroad and a firmer tone prevails here with quotations showing a slightly higher range, but there is only a light inquiry and a more urgent demand is necessary to place values on a parity with those ruling in foreign markets.

CELERY SEED.—Is somewhat unsettled and weak. Prime quality has been offered in large lots at fully 1 cent per pound below current quotations without finding buyers. The weakness is attributed to lower cable advices from primary sources of supply.

SPERMACELE.—Is in better supply and offered more freely with values ruling lower in the absence of important demand.

ACTANILID.—Values have been established on a uniform basis.

GUARANA.—Is weak and lower with stocks offering freely at a decline of fully 5 cents per pound on both whole and powdered.

OIL BERGAMOT.—Sanderson's brand has been reduced, and other varieties are correspondingly lower.

OIL PEPPERMINT.—H. G. H. has met with rather more attention, and all available parcels have found their way into the hands of one dealer. The spot stock is consequently closely concentrated and the market has a firmer undertone.

BALSAM FIR.—Canada has been offering more freely and the price has declined, but there is no material increase in the volume of business.

BALSAM PERU.—Is stronger with a higher range of prices demanded. The upward movement is due to reduced stocks caused by liberal shipments to foreign markets where better prices are obtainable.

SAL AMMONIAC.—White grain is fully $\frac{1}{4}$ cent per pound higher, but other grades are unchanged, though firm.

SUGAR OF MILK.—Has been unsettled and weak owing to a material accumulation of stock in the hands of manufacturers, and to dispose of the large surplus liberal concessions were necessary. Values have reached the lowest level ever recorded for this article, the recent decline being fully 3@4 cents per pound. It is claimed that some of the smaller makers have been unable, or at least unwilling, to meet this radical break in price and are closing their factories. A noteworthy feature, however, is the fact that manufacturers decline to make contracts for future deliveries, and it is not improbable that curtailed production will influence a reaction in values.

SABADILLA SEED.—Liberal arrivals have added materially to the available spot supply and sellers have modified their views regarding prices.

VANILLA BEANS.—The active trade demand which has prevailed for the past several months has caused the stock of dealers to become very much depleted and as a consequence large purchases are noted from first hands at prices showing an advance on the figures realized at previous sales. The market has

a decidedly strong undertone, and the consuming inquiry continues active.

NITRATE OF SILVER.—The disturbed condition of bullion and a consequent weak market has influenced a further reduction in price.

COD LIVER OIL.—Has been decidedly active and excited with a marked improvement in values. The upward movement has been wholly in sympathy with similar conditions at primary sources of supply. Cable advices from Norway indicate that the present season's catch is about over, and that it is practically a failure, which probably means that there will be a considerable shortage. Large sales have been made here at steadily advancing prices, and one of the principal holders has since withdrawn from the market.

CORIANDEER SEED.—The bulk of the spot stock is controlled by one holder, who declines to offer or name quotations. The small supply in outside hands is very much scattered and it is difficult to fill orders.

FENNEL SEED.—New crop, German, has begun to arrive and the samples shown indicate a superior quality.

GUM KINO.—Shows increasing scarcity, and the limited stock is firmly held.

GAMBOGE.—Is offering rather more freely at a slight concession in prices.

MENTHOL.—Is exceedingly scarce and firm.

PIPERAZIN.—The agents of the manufacturers announce that hereafter packages will contain 10 grams instead of 5, and that prices have been reduced to \$1.50 for single vials, \$1.35 per vial for lots of 50, and \$1.25 for lots of 100.

ASAFOETIDA.—Is moving freely into consuming channels, and supplies are again becoming reduced.

CUTTLE FISH BONE.—Dealers report a liberal receipt of orders from consumers, but competition continues and values show no improvement.

CREAM TARTAR.—Is somewhat firmer in tone, but former prices of manufacturers are still current.

SENNA.—Tinnevely varieties are ruling strong with an upward tendency and intermediate grades are quoted higher.

MEXICAN SARSAPARILLA.—Is fractionally lower, but without stimulating the demand.

RHUBARB.—Is moving actively on orders from the consuming trade, all varieties sharing in the general distribution, and values throughout show considerable firmness.

GUM BENZOIN.—Is meeting with an improved demand and the tone of the market is firmer, some of the spot stock having been taken for foreign account.

SOAP BARK.—Continues active, but liberal supplies and sharp competition prevent any improvement in values.

W. H. Bowdlear & Co., Boston, quote crude beeswax 29 to 31 cents. Previously quoted prices will be maintained on W. H. B. refined as long as present stock lasts. W. H. B. white, 40 cents. Caruba wax weaker. Ozokerite firm at previous quotations.

The druggists of Atlanta are having a good trade on vaccine virus at present, as four or five cases of smallpox have been discovered in the city. The physicians are making house to house visits and vaccinating all persons who need it.

OSCAR OLDBERG.

PROF. OLDBERG was born in the Province of Helsingland, Sweden, January 22, 1846. He received his early education in the Gymnasium at Gefle, where he took the classical course, made rapid progress and on several occasions won distinction for scholarship in the classes. In December, 1861, he became an apothecary's apprentice in Upsala, but on the removal of his family from Upsala, was transferred to Falun, where his preceptor was Sir F. W. Helleday, who greatly befriended the young student, gave him private courses of instruction in chemistry, and accorded him quite unusual opportunities for laboratory practice. Sir Helleday, who had been a pupil of Berzelius, was one of the rare examples of unselfish devotees of science, and was

knighted by the king because of his services and attainments. Oldberg's period of apprenticeship was shortened by permission from the Royal Department of Health on the ground of special merit. In 1865 he passed the public examination prescribed for dispensers ("Provisor"), and was allowed to take the oath of office at the age of twenty. Shortly afterwards he emigrated to America, where he has devoted about eight years to pharmacy in the dispensing business, and a few years in the manufacturing of pharmaceutical and chemical preparations. For eight years he held positions in the Treasury Department, being during the greater part of that time chief clerk and Medical Purveyor of the Marine Hospital Service, resigning in 1881.

During about twenty years he has rendered service as a teacher in pharmaceutical schools, devoting all his time to this work since 1884. He has been a member of the Committee of Revision of the Pharmacopoeia of the United States since 1880, and a member of the American Pharmaceutical Association since 1873. He has written a number of pharmaceutical works, several of which have passed through two or three editions. He was elected Secretary of the Seventh International Pharmaceutical Congress, Chicago, 1893. Since 1886 he has been the Dean of the Faculty and Professor of Pharmacy of the School of Pharmacy of Northwestern University, Chicago, Ill., with which institution his name and services are most intimately associated.

ENTERED AT THE DETROIT OFFICE AS SECOND-CLASS MATTER

ESTABLISHED 1887.

THE PHARMACEUTICAL ERA.

SEMI-MONTHLY.

Issued on the 1st and 15th of Each Month.

D. O. HAYNES & CO., Publishers,
DETROIT, MICH.

For Subscription and Advertising Rates see
advertising page 30.

REMOVAL NOTICE.

After May 1st, 1894, the publication office of
THE PHARMACEUTICAL ERA will be at

106 Fulton Street, New York City.

With increased facilities and the additional advantage of being in close touch with the leading drug markets, we expect to introduce many new and valuable features in the Journal, which will be to the advantage of our subscribers and advertisers.

D. O. HAYNES & CO.,
Publishers.

EDITORIAL.

CONGRESS OF CHEMISTS.

On August 4th, in the city of Brussels, Belgium, is to be held an International Congress of Chemists, which will be an important one, both for the sciences and the many industries in which chemistry plays a vital part. The object of the congress is to be exclusively a discussion of problems pertaining to practical chemistry. Chemists well know that analyses undertaken by different persons very frequently lacks uniformity of results, and this, too, without any just grounds for accusing the one chemist or the other of lack of theoretical knowledge, or practical experience, or dishonest intent. The congress will render possible a reliable comparison of tests of different scientists in the manifold branches of chemistry, both among themselves and against each other, and it is evident that this work will result most satisfactorily to chemists generally. Indications are that a representative and full attendance will characterize the meeting.

VIRGINIA'S NEW PHARMACY LAW.

At the last session of the Virginia legislature the State Pharmaceutical Association was successful in obtaining the passage of a very satisfactory pharmacy law for that state. The bill introduced was in the shape of an amendment to the existing law, and, though it met with some opposition, it was passed with votes to spare. The new law provides for the registration of two classes of pharmacists, "registered" and "registered assistant." To secure a license as a registered pharmacist the applicant must give evidence of having served four years in a regular pharmacy, and must pass the examination before the State Board of Pharmacy. The "registered assistant" must have been two years in service and have passed the board's examination. Any "registered" pharmacist, within the provisions of this act, can control a drug store, except that an assistant may substitute temporarily. It is provided that in towns of 1,500 or less any recognized physician, who has practiced five years, may be entitled to the privileges of a "registered pharmacist" without examination. General merchandise stores have the same privileges as under the old law, the sale of poisons requiring registration common

to most of our pharmacy laws. The new act goes into effect July 1.

JOIN THE A. P. A.

The caption to the following few remarks is a familiar one. It is almost a standing heading in the printing office of any pharmaceutical journal, and it is not without reason that so frequently are druggists urged to become members of this national representative association of pharmacists. There are many reasons why a druggist should affiliate himself with an organization maintained for the sole purpose of furthering the interests of pharmacy. There are high motives which should prompt him, but though these be lacking, his own selfish views should show him the profit sure to accrue from such membership. For every dollar paid to the association there is returned to the member many times its face value. The notice published in our news department states the advantages of membership very succinctly and strongly. We would reiterate the arguments offered and urge upon pharmacists that they send in their applications for membership, even though they see no immediate prospect of attending the annual meetings of the association. The volume of proceedings, alone, is worth much more than the cost of membership. The druggist wishing to know the world's progress in matters pharmaceutical will find in the report on the progress of pharmacy in each annual volume a careful epitome thereof. The next meeting, to be held at Asheville, N. C., promises to be a notable one, of much profit socially and professionally.

A GOOD IDEA.

In this day of countless plans for the abolition of the cut rate evil, all having for their purpose the re-establishment of the old prices for patent medicines and the securing of trade in these goods to the retail druggist, it is refreshing to find an association of druggists working along more ethical and professional lines, endeavoring to advance their business by adding to their repute as compounders and prescribers and as manufacturers of remedial agents. The Kentucky Pharmaceutical Association, through its president, is working to secure the greater recognition of the National Formulary, and to this end has compiled a list of members of the association, each to bring or send to the next annual meeting a sample of a specified preparation made strictly in accord with the National Formulary. After the meeting a committee will be delegated to take the specimens to the convention of the State Medical Association, where the samples will be shown and given to physicians in attendance, and the committee will explain the scope and aims of the National Formulary, and endeavor to secure an indorsement of the work. It will readily be seen what an advantage such a step will be to the pharmacist and the physician. It will acquaint the latter with the Formulary, make him much more independent of agents, save his patients money, and render him absolutely certain of what he is prescribing. We believe that physicians generally will be glad to aid this effort, and we bespeak for our Kentucky friends the interest of the fraternity in the support of the proposed movement.

MICROSCOPY FOR PHARMACISTS.

A correspondent in this issue writes of the desirability of establishing a department of microscopy in this journal. We thoroughly agree with him that microscopy may be made of great practical service to the druggist, but for his information and that of others not familiar with the history of the Era, it may be well to state why such a department is not now a regular feature of this publication. During the first two or three years of the life of the Era a department of microscopy was maintained, being placed in charge of a thoroughly competent exponent of the science, and all matter published was selected with special reference to its adaptability to the pharmacist's needs. From the start, however, it was apparent that there was not manifested in this department so large a degree of interest and appreciation as its merits and its value to the drug trade would seem to warrant, and because of this lack of interest it was finally discontinued as a separate feature. Since that time there have been given in our pages many small items and even quite lengthy papers upon the benefit of microscopy to pharmacists, and whenever opportunity has offered we have urged upon the profession the general adoption of the microscope as a means of valuation of a wide range of articles in the stock of the drug store and, farther, as a source of considerable income when used under the instruction of the physician as a diagnostic means. Feeling the pulse of the drug trade, as we do, and being able to estimate pretty fully its desires, we must confess that there is not as yet a very general demand for information on matters microscopical. We are always ready to present this class of matter when we can feel that it will be appreciated, and when the time comes that there seems to be a sufficient demand to warrant us in again establishing a separate department for it, we shall be quick in our endeavor to meet this demand.

A JUDGE'S OPINION OF THE PENNSYLVANIA PHARMACY LAW.

In our news columns last issue was given the ruling of a judge in western Pennsylvania regarding the pharmacy law of that state. A physician was tried for violating the law in compounding medicines without a license as a registered pharmacist. It was shown that he and his wife owned stores and managed them without the certificate from the board which the law requires, and the physician plead in his own defense that he only compounded medicines prescribed by himself. The jury found the defendant not guilty, but saw fit to charge him with the costs of the case, a rather peculiar verdict. The outcome of this case is similar to that of several prosecuted by boards in other states, but there is a new feature in connection with it which is attracting some little comment. The judge in his charge to the jury characterized the pharmacy law as unconstitutional in that it was designed to protect the druggist and to create a monopoly in the drug business. After the case was settled the judge, in conversation with well-posted druggists, was stubborn in maintaining this view, and added to his former statements by saying that the act was inconsistent, inasmuch as it requires an examining board to pass upon the qualifica-

tions of pharmacists, but does not say what the qualifications of the examiners shall be. The newspapers have made this decision and the judge's remarks the subject of considerable comment, and it is to be regretted that there has been given such wide publicity to the matter, for those who have studied the question thoroughly and those who were instrumental in securing the passage of the act, and later in maintaining it, have abundance of argument and proof that it is a wise measure, thoroughly constitutional, and calculated, not for the benefit of the drug trade, but for the best protection of the public. Inasmuch as there has been no legal decision that the law is unconstitutional, there is little need for anxiety because of this judge's ill-considered expressions.

PROTEST AGAINST RAISING THE ALCOHOL TAX.

The proposition contained in the amended Wilson tariff bill to increase the tax on alcohol and all liquids containing it, has afforded much material for discussion, particularly in the drug trade. The Iowa Pharmaceutical Association sent out very carefully prepared and strongly worded circulars inviting the druggists generally to protest through their senators at Washington against the increase of the tax, giving substantial reasons for this position. It is to be regretted that certain legislators at Washington, notably a senator from Missouri, have seen fit to treat these protests with levity and have indulged in vilification of the druggists and impugning of their motives. The papers are full of the sayings of Senator Cockrell, who indulges in ridicule of the drug trade and claims that the only reason for the protests made is that the druggists of Iowa and other prohibition states want the alcohol tax to remain as it is that they may have more license in the selling of liquors as beverages and in violation of the law. This senator is truly making an ass of himself in the opinion of all who are at all conversant with the relation the drug trade bears to the alcohol traffic. All who are posted know that alcohol is an absolute essential to the conduct of the prescription pharmacy, and that the proposed increase of the tax would fall upon druggists alone, adding to the already heavy weight which they carry. So far as the liquor habit is concerned, there would be no less liquor sold as beverages were the tax a dozen times as great as it is, but in the retail drug trade alcohol is a necessary article, entering into the manufacture of many medicinal agents, and there is no justice in farther taxing it. We would have no fault to find with Senator Cockrell or any other person who would candidly discuss the question on its merits, even though we might radically differ from him as to the advisability of increasing the tax, but we do resent (and in this resentment we are sure we are fully qualified to represent the drug trade) the slanderous imputation that druggists as a class are naught but illegal liquor sellers.

In our correspondence department is presented a letter from a Pennsylvania friend upon this same subject, and we bespeak for him the cordial support of the fraternity generally in a strong effort to nullify any proposition to increase the tax on alcohol, which already amounts to five times its cost. There are many

men in the Senate who can be induced to present the matter in its true light, and it is the duty of every druggist to unite in a strong endeavor to fight any increase along the lines proposed. True necessity and justice would require a material decrease of tax or its total removal upon alcohol as used in medicine, the arts, and industries.

SALOON DRUGGISTS.

What a lamentable disclosure is that made by the Springfield (Mass.) Republican with reference to the sale of liquors by certain so-called druggists in the town of Westfield, Mass. Massachusetts has an option law, the workings of which, in some localities, have turned the prohibition idea in general into a farce. For a \$1 license the druggist is enabled to sell liquors for mechanical, medicinal and sacramental purposes without a physician's prescription, merely upon certain registry in a book provided for the purpose. The effect of this law has been that a lot of scoundrels have posed as druggists merely to enter into the indiscriminate sale of intoxicating liquors as beverages. They observe the form of the law in keeping the registration book, but the spirit of the law is regularly violated. In our trade department are given a few facts with reference to the state of affairs in Westfield, and it claimed that a rum business on an equally extensive scale is being carried on by certain druggists in many other towns in Massachusetts. The reputable druggists of Massachusetts realize what a discredit and disgrace are brought upon them through the actions of these mongrel saloon-keepers, and co-operate whenever possible with those who desire just legislation for the control of both pharmacy and the liquor business. As it is, the seeker after a drink has no difficulty in finding someone who is willing to supply him the liquor, merely upon his going through the form of registration, which in a majority of instances is false in every particular. That the words mechanical, medicinal and sacramental, are very elastic in their interpretation is evident, and Massachusetts toppers are people of many aliases. From the facts quoted it is evident, too, that the degree of thirst which afflicts some men in that state is stupendous in its magnitude. The facts speak for themselves, showing that no druggist can sell ordinarily and in absolute compliance with the law the quantities of liquor which are attributed to those in Westfield.

Cannot something be done to wipe out this great stain upon the drug trade?

REPLIES TO EXAMINATION QUESTIONS, SERIES NO. 1.

The editor has been very much gratified with the evidence of the thorough appreciation accorded to the publication of questions for self-examination. Replies have been received from every nook and corner of the United States and in such number that the advisability of instituting this department and continuing it is thoroughly established, but perhaps the most gratifying fact brought out is the general excellence of the replies, showing that the young men in our drug stores not only are anxious for the acquirement of pharmaceutical knowledge, but possess a very satisfactory degree thereof. There being no other reward than the satisfaction gained from study, it is plain that

the drug clerks are thoroughly aware of the responsibilities of the profession they have chosen and are in earnest in their desire to best qualify themselves for its duties. The answers show a very pleasing familiarity with standard works on pharmacy and the knowledge of how they are best consulted and their information put to practical use. The range of questions in the first series was made to test one's information in the several branches of learning which go to make up the whole of pharmacy. These questions were not intended to decide the fitness of the student to discharge the duties of the dispensing pharmacist, but rather to afford him means for testing his knowledge and directing his studies into the channels and in the directions most serviceable and calculated to attain the best results, and they have abundantly served this purpose, as the results show.

The plan of these series (which have now reached the number of four) will be continued as a regular feature of the Era, but, because of the large number of replies and the labor necessary in looking them over carefully and adjudging them properly, the presentation of a new series will be deferred until the May 15th number. We want to congratulate the young men who have become so thoroughly interested in this work and urge them to continue in the preparation of replies to the questions, for we feel that by so doing they will be able to acquire not only additional information, but have offered them the opportunity of putting into practical service and submitting to actual test what is already theirs. True knowledge is that alone which may be made of practical service, and until it be tested in some manner, its value cannot be adjudged. Farther, we solicit still greater response and believe that as series succeeds series interest will grow and they will very materially increase as a means of self-help and self-examination. We publish the names of those who were successful in answering the required percentage of questions submitted in Series No. 1, and would thank one and all for their cordial appreciation and support.

DERMATOL.

Considerable interest has been evinced with reference to Dermatol, which is merely the trade-mark name for sub or basic-gallate of bismuth, and a statement of the facts in the case, so far as they are known, may be of service. The name Dermatol is trade-marked in the United States, and the owners of this name have received United States letters patent upon a process for making it and upon the article itself as a new preparation. The Patent Office Gazette, page 1452, 1891, published the registration of the trade-marked name, and on page 329 of 1893 gives the claim on which patents on the process and product were granted. The drug trade wants to know if sub-gallate of bismuth may be made by anyone, provided it be not called dermatol and provided the patented process be not employed. Ordinarily, it could be said that anyone could manufacture the article if he were careful not to infringe property rights in trade-mark or patented process. But in this particular case there enters another element into the discussion. The patentees claim that their patent is for a new article of manufacture, their claim

covering sub-gallate of bismuth by whatever process it may be made, provided it has the properties of the product specified in the claim. They state further that this product was not known prior to any claim to it by themselves, and that the Board of Commissioners of the Unit d States Patent Office have so held. They state their determination to maintain their claims in the courts, if necessary. On the other hand, there are some manufacturers who are marketing subgallate of bismuth, and who state that it and the process for making it have been known for more than fifty years past, much prior to the date of discovery stated by the patentees of the article. The point at issue seems to be merely one of fact, whether a subgallate of bismuth was discovered prior to the date named in the letters patent granted upon it. The United States Patent laws state that the kinds of things which may be patented are an art, a machine, a manufacture, a composition of matter, an improvement, etc. In some cases an art is a process, and the United States Supreme Court has decided that a process may be patentable irrespective of the particular form of the instrumentalities used. A process is said to be a mode of treatment of certain materials to produce a given result. It is an act, or a series of acts, performed upon the subject matter to be transformed and reduced to a different state or thing. A process is just as patentable as a piece of machinery. It is plain, therefore, that the proprietors of Dermatol may protect this name, and, farther, may protect their patented process of making the article. The only point to be settled is whether the product is a fit subject for a patent and whether the patent office did not err in granting it a patent. The new National Dispensatory publishes a process for making subgallate of bismuth, which is different from that outlined in the letters patent referred to, and there have been other methods proposed, and some, we believe, are in actual service for making the article. The courts will undoubtedly protect the owners of Dermatol against infringement of this name and the process described in the patent, and the trade will await with interest the outcome of any litigation with reference to the preparation of the product itself. If it can be proven, as the owners of Dermatol claim, that it is a strictly new invention and product, they would seem to be very fully protected against all manner of infringement, but other good authorities claim to be able to demonstrate that subgallate of bismuth is not a newly-known substance, but has been familiar to pharmacists for many years.

ANOTHER PLAN.

When things political and economical seem sadly out of joint, and the Senate of our country is apparently stopping its ears and holding its head in a vain endeavor to think, it may show either a lack of interest or ability on the part of a citizen who does not rush forward with a "plan" for disentangling the kinks which seem to have so thoroughly involved the straight lines of tariff reform. There is an unmistakable current of dissatisfaction running through business circles, which is shaping itself into demands that our Legislature either "fish or cut

bait," and whichever they elect to do, to do the same quickly and the suspense. It is beginning to dawn upon some of our strong-lunged partisans that economical matters are not, after all, so much a question of party as many patriots have supposed, unless the political parties can be divided upon the pocket-book basis. It is in times like these that the makers of plans find ready welcome, and it is noted that one in particular is receiving the attention of many who now see the difficulties lying in the way of party action in settling tariff matters, when a low tariff benefits certain people, and a high tariff benefits certain other people, irrespective of their torchlight-procession affiliations during the last campaign. Observing the brilliant results which have followed the institution of the Inter-State Commerce Commission and the Civil Service Commission, Mr. Coombs, a Democratic member from Brooklyn, and Mr. Joseph Cannon, Republican, of Illinois, have both recently proposed a similar body to take hold of this hot and restless tariff question, and, removing it from the arena of partisan politics, either still the noise, strangle it, or fix it up somehow. This plan has met with considerable approval from different quarters, and suggestions are now pouring in as to the proper way to put it into effect. There seems a decided unity in the demand that political economists (unless they belong to your own school of political economy), and politicians are to be debarred, and only business men, those supposedly well qualified to handle the ten figures and the \$ sign, be allowed to tinker with the tariff schedules. This subject is of course only called to the attention of the Era's readers for the sake of approving of the plan, and making an excuse for swelling the list of suggestions. In the first place, we should have a non-partisan president, one either engaged in some business, or in no business at all, to select this commission of business men, and, on account of the number of interests involved, and the peculiar significance of the number itself, it should be composed of thirteen members. Of course every citizen might consider himself eligible for such a position, but representative business men, men of affairs, should stand the first show. For instance, Mr. Carnegie is well posted upon the iron business. Mr. Havemeyer knows a little something about sugar. Mr. Rockefeller is an authority upon oils. Mr. Greenhut, of Peoria, might do something for us in the way of free alcohol for the arts. The Hon. T. W. Palmer, of Michigan, World's Fair connoisseur, and partisan agriculturist, might do wonders for the farmers. Mr. Frick, of Pennsylvania, ought to be able to say what is the proper thing to do with coal. We ought to have Chauncey M. Depew, in spite of his political tendencies, and he could fittingly represent the transportation interests of the country (or part of it). There would be no difficulty in making up the slate, except perhaps in fixing upon a representative for the drug interests. Here the wealth of good material might be an embarrassment. The ranks of the profession, from the modest drug store up to the highest eminence in the journalistic drug field, are crowded with an ability which yearns to sit upon a commission, and we are embarrassed ourselves when we think of it. But by all means let us have a tariff commission—right away, too.

(Written for the Era.)

PURCHASE BY INSTALLMENT—THE BRIGHTER SIDE.

There is a lady in Boston who believes that all the evils in the world have their direct origin in the Russian empire. Cholera, small-pox, cyclones, Tammany, corruption, labor riots and all forms of vice and disorder in Europe and America, she ingeniously traces to the special machinations of the Czar, whom, with his empire, she believes it to be her mission to expose and destroy. There are many similar examples cropping up from time to time of worthy private persons who concentrate their gaze upon some large and established institution, till they finally decide that they have at last discovered the first cause of all evil, and organize their misaloned accordingly.

Mr. S. P. Whitmarsh, who appears in the March list number of the Pharmaceutical Era with an admirably composed article on "Purchase by installment," has evidently determined that the origin of evil is the installment plan of selling goods, and has constituted himself the courteous and eloquent Don Quixote to destroy it. Like all persons who wander in this amiable phase of imaginativeness, Mr. Whitmarsh bases his presumptions on a large measure of truth. Improvidence is undoubtedly an evil, and to a large extent an American evil, and improvident people are apt to suffer from the result of their bad calculations. But improvidence is an evil as old as the world, and the installment plan is a very modern invention, and Mr. Whitmarsh produces no statistics or evidence to prove that the sufferings from this cause have increased in these later years. We emphatically maintain that it is not the case. Suffering from improvidence comes in the form of want, and the modern system of selling goods is to a large measure an antidote instead of a poison.

Worthy people without means have the opportunity of drawing upon their future prospects to supply their present wants, and so place themselves out of want. Outside of the installment plan this possibility does not exist for them, and this plan enables them to mortgage their capital—which consists of their health, their integrity, and their prospective savings—just as a city issues bonds upon its capital, payable over a long term of years during which the object for which it is expended is intended to spread its beneficial effects. In this respect the installment plan is an equalizer between the rich and poor.

The great majority of young men who enter the drug trade do so with very limited capital. There are no glittering prospects before them of sudden wealth to be accumulated by one or even many successful strokes, but instead the certainty of hard work during long hours and long years, and the prospect from the beginning of a reasonable competence, and a substantial saving not wealth, in the end. The great attraction is the dignity and noble purpose of the profession. The druggist is in the eyes of the world a little higher in the scale of honor and dignity than the member of any other retail trade. His education and intelligence are necessarily much above the average. But neither the attraction nor the prospects constitute any allurements for light-minded young men, and there are very few butterflies indeed in the

trade. On the contrary, the young men who enter it are unusually sober-minded, intelligent, practical and solid, with every inducement towards economy, and towards the knowledge of making a dollar go as far as possible. The majority of these young men bless their stars that, with the heavy outlay necessary to purchase their stock for cash, they are able to buy their fixtures and soda fountain on installments. In both these lines there is abundance of competition, sufficient to insure moderate prices, and Mr. Whitmarsh's allusions to a 400 per cent profit have no application to these, if they could have any application anywhere.

The lines of business which have the title of that profit are not very numerous nowadays, and the mere mention of such profit stamps Mr. Whitmarsh's whole point of view as impractical. The rate of profit must be commensurate with the risk, which undoubtedly increases with the length of time over which payment extends, and it is only natural and proper that a somewhat greater rate of profit should be computed upon goods sold upon the installment plan. But the necessity for this is largely offset by the fact that title in such goods is reserved in the vendor until paid for, and the risk is therefore minimized. The profits of the soda fountain companies are matters of public record, and their annual dividends are known to be from 6 to 10 per cent, which is a long way from 400 per cent.

The evils which arise from the installment plan of purchasing result only when the article purchased is secured to satisfy a desire for some luxury,—not a necessity—from which no revenue is derived, and which is therefore an expense pure and simple. This is surely not the case with either store fixtures or the soda fountain. The former are a condition precedent to doing any business whatever, and the soda fountain is bought purely for the sake of its daily returns. It is true that it is often highly attractive and ornamental, but the whole influence of its attractiveness is turned into the channel of profit. The men who make the most money out of soda water are those who have large and handsome apparatus. The druggist knows that soda water is the best paying part of his business, and that, if he can only establish a good soda water trade, he need not lie awake nights thinking how he shall make both ends meet.

Mr. D. S. Carraway, in an admirable article in the March number of *Merck's Market Report*, writes: "The most profitable of all side-lines, in my experience, is soda water; to me it is the best paying part of my business, and I am going to tell you how I make it pay"—which he does tell in words of gold.

The percentage of profit from the sale of soda water is far greater than the extra interest which the druggist has to pay for the convenience of paying by installments. The druggist knows the difference between these two rates without our mentioning figures. It is therefore clear that, if he is able to secure a trade in soda water, his investment is on the soundest basis possible, since the returns must exceed the expenditures.

The obtaining of custom is a condition precedent to success in any business, so that no special risk attaches to the purchase of a soda fountain, even if bought on installments. In fact, the young druggist who should follow Mr. Whitmarsh's

advice not to buy his soda fountain till he had saved the money for it, would probably have ample time to make his selection, and should be able to appreciate his Rachel after the long years of waiting. During those years he would be thrown out of competition with his older rivals in the trade, and would have nothing but those terrible thirty day bills to treat as the sources of his savings. The young Ph. G. will, we think, find the humor of Mr. Whitmarsh's suggestion rather grim in its character.

Mr. Whitmarsh forgets that in business, as in everything else, things find their level. Systems with a basis of greed on one side and gullibility on the other are not long-lived. But the installment system, though modern, has gone on increasing in strength till it envelops whole lines of trade, and includes many houses of world-wide reputation, and its roll of patrons is probably as unblemished as any system of trade can display. These houses are governed by business considerations in extending credits; it is as much folly for them as for other business people to permit their agents to overload customers. They are compelled in the nature of things to be extremely lenient in their collections, and, if the sentiment of their customers would be taken, they would probably be found distinguished for liberality instead of extortion. It is their interest to have the good will of the whole trade, which can only be held by methods which are at least just, and which lean towards liberality.

All systems of credit have their abuses, and we will not claim that none arise under the installment system. Errors of judgment both in selling and buying will undoubtedly be made at times, but the struggling druggist will continue to rejoice that, while fixtures and a soda fountain are necessary to him, he can secure them upon easy terms. And when his soda fountain more than pays for itself, that is, while the profits from it exceed his payments to the manufacturer, he will be still less likely to complain. The installment system is a giant, and a good giant, and its virtues furnish the obstacle to Mr. Whitmarsh's success in this instance as a giant-killer. The general principles which he lays down are undoubtedly good, and undoubtedly there are cases, even under the installment system in which they apply, but these are exceptional. As far as the influence his article may serve to reduce any of the possible evils, it is good for both seller and buyer, and is in all respects praiseworthy. But the installment plan is here to stay; it is a big boy now, and critics would do well to direct their efforts towards improving the development of that which they cannot destroy.

A. B.

BISMUTH SUBGALLATE IN LONG-STANDING DYSPEPSIA.—Flint has been in the habit of prescribing the drug in capsules containing five grains each, but of late he has given it in the form of tablets, which are more convenient and seem to act more favorably. (N. Y. Med. Jr.) One capsule or tablet is given before or after each meal. He refers especially to four cases in which the duration of the dyspepsia was eleven, six, four and three years respectively. In all cases the distress and flatulence promptly disappeared.

PHARMACEUTICAL EDUCATION.*

I have read, from time to time, much on the subject of pharmaceutical education, and am of the opinion it is of far greater importance to the general public than to the pharmacist himself. In considering any subject, one must view it as it is, and then as we would have it. To determine our present position, we have but to ask, concerning our present applicants for examination, who they are? Their age, education and success as practical pharmacists.

First. As to who they are, you will find that a large per cent are boys with a very limited common school education, induced to select the calling because of the supposed short road to the almighty dollar. As a rule, they never have been interested in school and are unable to study. Unable to study! you say. Yes. I think I am safe in saying that four of every five that present themselves for instruction are unable to study. There are a great many reasons for this; but the foremost is, they have been taken from the common schools before they have learned to study. There they study one hour, recite their lesson the next, and then forget. With this undeveloped and plastic state of the mind, they accept the position of janitor in some drug store, or, perhaps, undertake to manage a soda fountain.

Now, with this kind of work, what will that mind do? Nothing. The boy becomes a mere machine, doing and undoing as his employer touches the spring, and this experience meets the requirements of the law. If, per chance, he should have time to study, how will he proceed? Too often by memorizing the contents of some quiz compend, and with this, himself a machine, he presents himself for examination, happens to pass, is given his certificate, and is considered equally competent with those of years of experience and study. This method gives but a bubble that may float to apparent success, but let it strike on one of those knotty problems, let it come in contact with that rough exterior, formed by interwoven theory and practice, it breaks, falls, and leaves but a drop to warn the observer to pass on but profit thereby. Other evils may be located in our colleges of pharmacy, for no school is without its shortcomings.

But let us suggest: The mind that is to plan, govern and direct our very movements in compounding medicines must be well developed, trained, and supplied with the best channels through which to communicate with our physical working bodies. Then to this end, keep the boy in the public schools, let him complete a high school course where he will be taught to think and not to memorize. This high school course should be completed with an elementary course in chemistry, including qualitative chemical analysis, physics and botany having been studied before. My experience is, too many are advised that chemistry and botany are of no value to the pharmacist. In my opinion, there can be no greater error than this. God has placed before us mind and matter (if there be such a thing as matter). He has given us a greater quantity of matter than anything else, hence the greater the demand that

*Read before the Iowa State Pharmaceutical Association, March 14, by S. R. Macy, principal of the Pharmaceutical Department of Highland Park College, Des Moines, Ia.

we study matter, and the study of matter may be divided into two grand subdivisions, chemistry and physics, and it is the study of these two branches combined that gives us the best methods for the preparation of medicines. 'Tis a pity, but true, that too many are doing their best to cover with the mantle of practicality this very part that gives all the practical side there is to pharmacy.

Then, I say, take the boy from the high school, or, better still, from some scientific course, put him into the store, with his chemistry, physics and botany, there let him spend a part of the time studying the drugs from the proper standpoint, and after a reasonable time spent in the store, getting the proper kind of experience, let him attend some good school of pharmacy, where the thoughts may be planted one after another, until a good share of the present known field of pharmacy is plowed and planted, and upon the completion of this planting, the student graduates; i. e., he reaches a certain mark on the scale, or, if you please, he shows upon himself the mark of intelligence, placed by the combined efforts of himself and teacher. If he be a man after his Creator's idea, he will continue to graduate or make that standard himself, using the marks already made for rounds upon which to rise to nobler and higher things. Graduated! you say. Yes. Ready for the responsibilities of conducting a drug store. No. But before we can go on and do justice alike to this man and the public, new laws must be enacted; and before we can enact new laws the public must be educated, when the pharmacists turn teacher to educate them, and the pharmacist will not turn teacher until he is awakened to the situation. The public must be taught that medicines are not playthings to be put into the hands of children and the uneducated, but rather that they should be handled only by the most skillful hand and well trained mind. If a mind has the brain power to work, create and formulate, or, in other words, has the power to think, it is then qualified to direct and work externally. That the public must know.

Then let a law be enacted, having for its aim the protection of the public by the education of the pharmacists and keeping them educated. Let it prescribe the college course, make said course a requirement, recognize no degree, require some experience, examine all persons without exception, examination to cover both college course and experience, and the examination to extend over days instead of hours, put the applicant at the prescription counter, and if he be able to stand the test, give him a certificate that entitles him to the right to practice pharmacy six years. Give him to understand that he must keep abreast of the times by cultivating the habits of intellectual industry. Examine him some time during the early part of his sixth year under his registration. Then, if after a fair test, he shows that he is intellectually lazy, or that his cup was full before and can not hold more as civilization and education advance, let him step down and out. This is what the public should demand, and what it should receive. Then, and not until then, will pharmacy have reached its true standing.

AMIDO-ANTIPYRINE. — Antipyretic, more soluble than antipyrine.

PROFESSOR EDWARD SCHAEFER.

Prof. Edward Schaefer, the son of a jurist, was born on the 7th of December, 1842, at Bern, Switzerland, where he received his first schooling. Originally intended for the ministry, he was obliged, through falling health, to forsake his theological studies for an occupation which would combine a desirable amount of physical exercise. An early liking for the natural sciences caused him to choose pharmacy; to begin the study of which he left the Obergymnasium at Bern in 1861 to enter the well known Hagenbach Pharmacy at Basel. While at Basel he had the privilege of attending the lectures of the physicist Wiedemann and the chemist Schoenlein at the university. The last named original and brilliant scientist had a strong and lasting influence upon the young pharmacist, so that he was not only interested in the careful study of the original chemical researches with which the discoverer of ozone and gun cotton was then engaged; but he also took upon himself the task of collecting the separate investigations of Schoenlein, which were scattered in different journals. From these Schaefer selected the following: "On Ozonized Oxygen," "On Hydrogen Peroxide," "On the Properties of the Ferments," and in a special essay he called the attention of the medical profession to these researches because of the uncommon physiological-chemical interest which they possessed.

He now left Basel to finish his apprenticeship at Geneva and Bern, and upon completing his "Assistants' Examination" he was engaged in Saxony as an apothecary, returning in 1865 to Bern to continue his pharmaceutical studies under the direction of his teacher and future friend Flueckiger. Passing the "Pharmacists' Examination" in Canton Bern, he conducted a pharmacy there for two years, when, through the assistance of a Bernese endowed scholarship, he was in 1869 again induced to leave his home in order to satisfy a long desired wish to broaden his knowledge by visiting larger scientific centers.

He resumed a part of the years 1869-1870 in Berlin, London and Paris.

At Berlin he heard the lectures of A. W. V. Hoffman, Magnus, Du Bois-Reymond, and attended the practical chemistry lectures of Prof. Wichehaus, at the same time conducting physiological

researches at the Charite Hospital, at which Prof. Liebreich was then engaged. In London, besides attending the lectures of Tyndall, Frankland, Attkid, and Redwood, he was especially engaged in the study of the large pharmacognostic and botanical collections of the Kew Garden, in the then existing "India Museum," and at the School of the Pharmaceutical Society in Bloomsbury Square. The summer months spent in Paris in 1870 were utilized principally in the closer consideration of the Gubourg drug collection of the Ecole Supérieure de Pharmacie, also of the Musée d'Histoire Naturelle in the Jardin des Plantes. Besides this the lectures of the physiologist, Claude Bernard, and the chemist, M. Berthelot, were heard, while several chemical researches in the latter's laboratory in the Collège de France were completed. The chemist Chevreul, then 80 years of age, through the recommendation of the Swiss geologist, Bernard Studer, greeted the young Swiss most friendly. Because of the war sentiment existing, things became unpleasant, and in the fall of 1870 he returned to his native city, where he was appointed a commissioner under the "Alcohol Laws" enacted at Bern. To fulfill this office he removed in 1871 to Zurich where in 1873 he undertook the management of the pharmacy of his future father-in-law, one of the oldest in the city, and conducted it personally until 1883.

His career as a teacher of pharmacy began in 1873, when, upon the invitation of the Swiss Board of Public Instruction, he first became a lecturer (Privat-docent) of pharmacy at the confederate Polytechnicum in Zurich. In 1874, given the title of professor, he was intrusted with the obligatory lectures on pharmaceutical subjects. It was not until 1881 that the Institute had established a really independent professorship for pharmaceutical and toxicological chemistry and pharmacognosy, which he filled until October, 1882, to then relinquish it in order to accept the chair of professor of pharmacy and director of the Pharmaceutical Institute of the Strassburg University, which Prof. Flueckiger had with such eminent and successful ability occupied for twenty years.

During his twenty years' residence in Zurich, which had become his second home, he was a member of the Pharmaceutical Examining Commission, as also of numerous official boards, and was for seven years president of the Swiss Apothecaries' Society; during the last three years he has been chairman of the Swiss Pharmacopoeia Commission. Of his researches in the field of pharmacognosy, pharmaceutical chemistry and chemical toxicology, published in chemical and pharmaceutical journals, the following may be mentioned: The cyanogen compounds, the guaia-copper reaction, cubeb-campor, quebracho bark, sun vomica, ergot, cyanin, carbonic acid, soluble oxides of iron, salicylic acid, benzoic acid, cubebin, guarana, ether, ethereal oils, chloralcyanhydrin, etc. A large number of his publications have reference to C. F. Schoenlein's researches on ozon, hydrogen peroxid and ferment materials, which it has been his endeavor to complete.

Among these which have appeared in the "Swiss Pharmaceutical Weekly," "Wittstein's Quarterly Journal for Practical Pharmacy," "The Reports of the

Berlin Chemical Society" and the "Journal of Biology," etc., may be mentioned: "Ozone and Antozone" (1866); "On a new ozon compound of organic nature" (Chinon), 1867; "Active oxygen and its physiological importance" (Festival writing for the twenty-fifth meeting of the Swiss apothecaries' Society, 1868); "Hydrogenperoxide and its relation to the ferments" (1889); "On the chemistry of oxygen;" "Contributions to the chemistry of the blood and the ferments" (1879); "Oxygen made active by slow oxidations" (1873); "On the influence of the alkaloids on the usual properties of haemoglobin" (1874); "On the influence of antiseptic means on the properties of ferment materials" (1875); "The significance of water in disinfection" (1884); "On the action of cyanhydric acid, chloral hydrate and chloralcyanhydrin on the enzyme, on germable seeds of plants and on lower fungi." (Festival writing of the Scientific Institutions of Zurich in jubilee of Prof. C. V. Naegeli and A. V. Koelliker of Munich and Wurzburg 1891). Another larger publication is the German edition of Prof. Plugge's work, "On the more important therapeutic agents in their varying chemical composition and pharmacodynamic action" (Jena, 1896).

Edward Schaer was associated with the publication of the Swiss Pharmacopoeia, second edition (1873), and of the supplement of the same (1876), and directed from 1889-1893 the work of the Swiss Commission for the new confederate pharmacopoeia which becomes official the present year. In recognition of these services he was in 1892, in consequence of his removal to Strassburg, given the honorary degree of doctor of medicine by the University of Zurich. When the curator of the Strassburg University was compelled to accept the resignation of Prof. Flueckiger from the Natural Science Faculty, the keen feeling of regret exhibited by the immediate faculty at the loss of one of its most prominent members was soon communicated to the deeply attached students as well as the university at large; which caused much careful reflection in the efforts of the university authorities in selecting a capable and worthy successor. In their deliberations upon the suggestion of Prof. Flueckiger, the present incumbent, Prof. Schaer, was chosen, and from the crowded laboratories and lecture rooms, together with the deep interest which each student takes in his work and the warm, friendly relationship existing between instructor and pupil, the selection has been a very important one, and to the list of names which the old Pharmaceutical Institute (repeatedly extended but still retaining its French architecture of fifty years ago) has had since its origin in 1820, another successful and excellent teacher has been added.

Personally, the professor is tall, with most affable and polished manners, an excellent lecturer, instructor and linguist, and possessed of that fascinating modesty so characteristic of the Swiss.

RESORCYLAIGIN.—Antiseptic; made by the action of potassium resorcyate on antipyrine. Potassium resorcyate (resorcinate) made by boiling 1 part resorcin with 5 parts K_2CO_3 and 10 parts water. Resorcyalaigin is slightly soluble in water, very soluble in alcohol. Because of its strong acid properties, forms soluble salts with alkaline bases.

SHALL THE PRACTICE OF MEDICINE AND THE PRACTICE OF PHARMACY CONTINUE DISTINCT AND SEPARATE.*

By J. M. Good Ph D. G. St. Louis, Mo.

By giving a place for the discussion of problems in pharmacy in this organization, the intimate association of the two callings and their mutual dependence upon each other is emphasized. Yet it is scarcely to be expected that our sessions will be the ones most numerously attended. Those in both professions whom we delight to honor are they who confine themselves strictly to pharmacy pure and simple, or to the practice of medicine general and special. Nearly every physician has been made painfully aware, some time in his career, of his lack of pharmaceutical knowledge; hence we hope none will feel the time spent here has been wholly unprofitable.

Materia medica, as the pharmacist studies it, is different from that which is taught in the medical schools, and while we are likely to get hints here as to the therapeutic actions of drugs, they will serve simply as a warning for us to confine ourselves to compounding, and let those better able to judge and discriminate take the responsibility for the effects of drugs. In discussing some problems in which our two professions are interested, I am not unmindful of the fact that those whom I am about to criticize do not attend conventions and to a great extent they are indifferent as to our opinions of them.

In this section we, physicians and pharmacists, meet on common ground, and we can be mutually helpful. We may criticize each other, but always in a friendly way, I hope, and we may ask and answer questions to the edification of all.

It is too frequently the case that a man's readiness to give advice on any subject is inversely to the amount of knowledge which he possesses in regard to it. This seems to apply particularly to persons who are ready to give information about the action of remedies and the treatment and care of the sick.

Just now there is in the professions of medicine and pharmacy a disposition on the part of each to usurp the functions of the other. This is not the case, however, with the busy or successful man in either calling. He whose time is fully occupied is not likely to suspect any one of invading his field.

The exhibition of remedies is attended with a considerable degree of uncertainty at best. To know definitely the therapeutic action of drugs requires clinical experience with careful and intelligent observation at the bedside of the sick.

Accurate diagnosis must precede these. It is a weighty responsibility which rests upon the physician. Fortunately for him, as his stock of experience increases and his years multiply, he realizes these facts more forcibly than in the beginning.

For the druggist who recklessly and ignorantly assumes these responsibilities he has ill-concealed contempt. To his credit be it said he is willing to concede to the druggist all that he asks for himself, and he is just as prompt to condemn that foolish and dangerous legislation which assumes that the holder of a medical diploma is necessarily a person who, if not an expert and skillful manipulator of

drugs, may safely be intrusted in compounding and dispensing them. The absurdity of such a claim is so apparent as generally not to admit of argument. Aside from the injustice of this to the entire business and profession of pharmacy, there is the additional damage to the colleges of pharmacy. They should be strengthened, not weakened. It is the duty of each profession to uphold its educational institutions. We cannot, then, with complacency see the right to legally conduct a drug store conferred upon a man who has never served a day's apprenticeship in the business, when a period of four years of active service is required before a diploma from a reputable college of pharmacy will be granted. The easiest and shortest way to legal recognition is the one which will be adopted by the majority; the acquisition of knowledge is not a controlling influence with them.

Shall there continue to be the two professions, medicine and pharmacy, or only one?

If physicians convert their offices into dispensaries, and druggists, seeing their trade melt away, qualify as practitioners and add consulting rooms to their places of business, the dividing line will be obliterated in a generation.

This is retrogression; it is degeneracy. It is opposed to the natural tendency toward the division and distribution of labor and the segregation of all classes of workers into specialists. It is discouraging, it is demoralizing; and it seems to me some action by this section calling attention to the situation, would be timely and in order. Any steps taken should be such as would be approved by the conservative members.

Shall physicians dispense their own remedies; or shall the practice which has prevailed now for several generations of having the compounding done on order outside of the office, continue?

As I have already said, the busy practitioner is most likely to call the druggist to his aid. It will probably be said that the labor from which the old-time doctor was so glad to be relieved has been overcome by the modern methods in the manufacture of pharmaceuticals. How dainty, delightful, convenient and cheap are the tablet triturates for instance. Let the disciples of Hahnemann beware. Their occupation will soon be gone. Similia similibus curantur has ceased to be their strongest card. Sydenham, in his enthusiasm over what might be expected from the potency and convenience of the alkaloids, predicted that the time would come when a physician could carry around with him, in the head of his cane, all the remedies that he needed. His dream is not likely to be realized, for we have long since learned that the therapeutic action of a drug is very different from that of any one or several of its alkaloids.

Seeing this tendency on the part of physicians to do their own dispensing, it might be said that the wide-awake druggist will rise to the occasion and advertise his store as a "physicians' supply house." In time that may be all that will be left for him. At present, however, he is likely to have his triturates left on his hands, a perpetual reminder of mistaken enterprise.

It is impossible, as yet, to "meet all the indications" with these little tablets, and Dr. Saccharum Lactis, so long as he

*Read in the section on Materia Medica and Pharmacy at the forty-fourth annual meeting of the American Medical Association.

is obliged to send me an occasional prescription, will obtain his supplies through some other channel. But I am told that the triturates alone do not occupy the field? Hypnotics, alteratives, emmenagogues and rejuvenators multiply almost indefinitely. The habit of studying cases and selecting single remedies is becoming impracticable and polypharmacy again prevails.

"Physicians' supply" houses may or they may not turn out products which are accurate and reliable. The dispensing physician, unless he be a druggist, will naturally use the "ready-made" prescriptions.

Many who do not dispense justify the habit of ordering them on the plea that they are more skillfully prepared than will be the extemporaneous prescription in the average drug store. It is in order for pharmacists to question this. The "manufacturing pharmacist" cannot monopolize either knowledge or skill. The manager of the establishment is seldom a manipulator of drugs, and often the assistants have placed upon their services a very low pecuniary value. I do not say this in a spirit of condemnation, but to show that in the use of such preparations there is not the universal safety which some suppose. For the most part they are not dangerous, since in the manufacture of the so-called "elegant" pharmaceuticals there has not yet been discovered any way of disguising disagreeable drugs that is so successful as omitting a large part from the mixture. To any one having the best interests of medicine and pharmacy at heart this state of things is not gratifying. Druggists who by years of faithful labor have established a reputation will not be seriously affected, but the inducements for others to come forward and take their places are growing small by degrees and beautifully less. The following, quoted from a circular recently received, is a good example of the claims of superior skill which are often made by the mixers of proprietary remedies:

An elegant preparation, in powder form, resulting from the union of salol and acetanilid, skillfully combined with an alkali, which, with the peculiar method of compounding, greatly modifies and positively improves the therapeutic effects.

In point of quality, as a fine and scientific pharmaceutical product, this preparation is surpassed by none. The chemist properly apportions the ingredients and the elements are combined by positive chemic laws, that always produce perfect and uniform results. This careful method is observed that the greatest possible therapeutic benefits may be derived from the union of the composing elements, and a peculiar and entirely new therapeutic agent is the result. The proprietors spared no time, labor nor expense that they might present to the medical profession a perfect remedy in its class, uniform in strength and action.

In comparing the claims of this with similar preparations in the market, we invite the particular attention of the profession to this fact: We state positively what it is made of. We do not refer to coal tar derivatives in any mysterious or indefinite way, but state plainly that acetanilid and salol furnish the active elements.

Will the physicians who prescribe these remedies, and the patients who afterward recommend them to their friends

and purchase them without prescriptions, never learn that it was to make money and not to benefit mankind or alleviate their sufferings that actuated their originators?

In the mid of these conveniences in the shape of ready-made prescriptions, triturates and mixtures of various anti-pyretics the labors of the advertising specialists are made easy and, much to the injury of both physicians and druggists, the free dispensaries multiply.

It will be maintained by some, perhaps, that the druggist has only himself to blame for his vanishing business, they claiming that either by his practices or his incompetency he has forfeited the confidence of the medical profession. We must ask for a "stay of judgment" in this matter. Do not condemn all or any considerable part. It is allowable to discriminate against dishonorable, dishonest and incompetent men wherever we find them; they are as likely to be found in the pharmaceutical profession as elsewhere, and no more so. According to my observation, pharmacists are as a class careful, painstaking, and well qualified to stand where they are often needed, between the prescriber and the patient.

We are all fallible, and every man, some time in his life, will probably be obliged to acknowledge his responsibility for errors. The blunderer and the possible victim are alike fortunate when some one stands between them. This is possible only when the prescriber and the dispenser are two persons.

HOW ALUMINUM IS OBTAINED FROM ORES.

Aluminum is now so rapidly growing in demand with the cheapening of the metal that it attracts more or less popular attention. In the form of clay the metal is all around us, but this ore is too poor in the metal and too difficult of working to make it a profitable source of supply. Corundum is the oxide and theoretically nearest the metal from a metallurgical point of view. Indeed the metal has been extracted from this mineral on a small commercial scale, but the supply is too limited.

The metallurgy of the aluminum is theoretically the same as iron, that is, the compound used for extracting the metal in each case is an oxide. The oxygen in both cases is removed by carbon. The facility of carrying into practice the extraction of the metal is entirely different. In an ordinary blast furnace the carbon of the coal or coke easily extracts the oxygen from the iron ore, so that a pound of two of coal produces a pound of metallic iron. The oxide of aluminum defies such easy processes, and requires a temperature vastly greater than the fiery iron furnace. This is obtained by electric currents and a process of electro-metallurgy is adopted. A trough is lined with gas carbon. In this, cryolite, to the extent of 500 pounds, is placed. Into this press, enormous electrodes are inserted, and the heat melts the cryolite, which is not decomposed by the electricity. With this fused mineral, about a third of its weight of oxide of aluminum is mixed, and it is soon dissolved. In this condition the aluminum compound is decomposed, the oxygen being removed at the expense of the carbon electrodes, and the molten particles sink in the cryolite (fluoride of aluminum and sodium) is not consumed, the operation is continuous. However, the affini-

ty between the metal and the oxygen is so great that not merely the carbon of the electrodes is consumed, but about 75 pounds of coal are needed to develop horsepower to produce electricity enough to decompose the oxide.

From the method pursued, we see, says Science, that the ore most available is that nearest approaching an oxide and rich in the metal. Of the natural compounds occurring in large quantities, bauxite is the most important. This is essentially a hydrated oxide of aluminum, but with usually an admixture of oxide of iron and ferruginous. A high grade ore contains 60 per cent of alumina, only one or two per cent of each of the other constituents, and the balance is water. In this country, the bauxite occurs in Georgia, Alabama and Arkansas. It is from the recent volume on the Paleozoic Belt of Georgia, by Dr. J. W. Spencer, that the materials for this notice are derived. This report is the most exhaustive treatise upon bauxite which has appeared in this country. The mineral occurs in masses of small concretions in great products in the Knox dolomite (the lowest formation of the lower Silurian system). Where it is formed, the calcareous matter has been leached out of the impure limestone, leaving a great mass of peculiar siliceous clay or loam, which is sometimes 200 feet thick. This represents that as much as 2,000 feet of limestone have been removed from the region, which has been exposed to atmospheric degradation for long geological ages. As the alumina has resisted solution, a process of concentration has gone on so that the accumulations make themselves conspicuous. The ore always occurs in proximity to brown iron and manganese ores. The author explains their occurrences as having been brought down in solution by streams and deposited in lagoons, in which the limestones were also forming. The author gives us here an interesting chapter on chemical geology, without saying so in his treatment of the origin of bauxite. Under the conditions of occurrence ferric oxide often replaces a portion of the alumina, sometimes to the extent of twelve or fifteen per cent. This, however, is no injury, for in preparing alumina for furnace uses a valuable by-product is obtained. Silica may sometimes reach 20 or 30 per cent. In this case the mineral must be considered more or less a mixture of bauxite and clay. Amongst the bauxite, iron and manganese deposits, dark pockets or "horses" of clay, or often kaolin, are frequently seen. When the silica is present in such quantities the mineral becomes too poor to be of use. For making alumina the bauxite is fused with soda, from which mass the pure alumina is extracted. With the visible supply of bauxite and greater economy in the power consumed, we may hope before very long to see the metal at twenty-five or thirty cents a pound, when its uses in the arts will be enormously increased.

CREOSOTAL.—A mixture of carbonates of gusiocol and homologues found in creosote; is prepared by passing a current of phosgene COCl₂ through a solution of sodium creosote. A viscous liquid, inodorous; insoluble in water, glycerin and dil. alcohol. Substitute for creosote. Dose, 10 to 20 gms. Does not disturb the digestive functions; in the intestines it splits up into creosote and CO₂.

PHARMACY.

SPENT GINGER is found in the trade in England.

CAFFEINE OXALATE, says Merck, is a true salt, occurring as a white, crystalline powder, soluble in water and alcohol.

BISMUTH SULPHOCARBOLATE is a tentative candidate for favor as an antiseptic. It is a faintly red powder, soluble in water.

QUININE AND URANIUM CHLORIDE is described by Merck's Berich as a yellow, crystalline powder, soluble in water.

TO REVIVE LINOLEUM.—Carefully melt together 18 ounces of solid paraffine and 1 ounce palm oil, remove from the heat and incorporate 4 ounces kerosene.

DANGEROUS ERROR.—The National Dispensary makes an inexcusable error, says New Remedies, by misquoting the synonym for phenyl-urethan as "euorphin." The name is "euphorin."

MORPHINE IN SOOTHING SYRUP (Ch. and Dr.).—The agents of Winslow's Soothing Syrup inform the trade of England that the exact proportion of morphine contained in this preparation is one-eighth of a grain to the ounce, thus making the maximum dose one-sixty-fourth of a grain.

PHENATED LIME.—This disinfectant (chaux phenique) used largely in Russia, is prepared by thoroughly slaking three parts of lime with five parts of water and adding under constant stirring and in small portions two parts of gas tar. The yellowish-brown mass thus procured is mixed with water and used in liquid form.

ACTION OF SODIUM UPON WATER.—When metallic sodium is placed upon water a sudden explosion takes place, with decomposition of the water. The cause of this action has not been definitely settled, but from recent researches M. Rosenfeld concludes that a compound of hydrogen and sodium is formed which, through sudden dissociation, is the cause of the explosion.

DIPHThERICIDE is a diphtheria medicine prepared in pastilles consisting of gutta percha and gum damar, bearing as remedials sodium benzoate and thymol, with saccharin. Three or four of these pastilles are to be chewed daily, like chewing gum, and J. Bergmann claims they are quite efficient in catarrhal affections of the pharyngeal mucous membrane in children.

SANITATION IN MECCA.—The Turkish government, we are informed by Ch. and Dr., is working to lessen the danger of the outbreak of cholera epidemics among the pilgrims who visit Mecca and other holy places. Several new lazarettos are to be equipped along the lines of pilgrimage. Disinfecting stoves have been ordered for the hospital which it is proposed to build near Mecca.

SODIUM PEROXIDE is coming into much popularity as a bleaching agent. It is used by dentists, in 40 or 50 per cent solution, for bleaching teeth, and is finding wide application along industrial lines. It is a white powder, easily soluble in water, which decomposes it into peroxide of hydrogen and sodium hydroxide. The latter is often of advantage from its solvent power on fats and other organic bodies.

LIQUID CARBOLIC ACID.—C. F. Henry presented a paper upon this subject to the Edinburgh Chemists' Assistants' and Apprentices' Association last month. He claims that the best results are obtained by using 90 liquid parts carbolic acid, 7½ liquid parts water, and 2½ liquid parts alcohol. Other speakers suggested that the stability of the liquid at low temperatures might be attained by adding 15 rather than 10 per cent of water.

PREPARATION OF OXYGEN.—Delamotte (in Repertoire) recommends that pharmacists prepare oxygen by allowing water to fall drop by drop upon sodium peroxide. The reaction may be checked by mixing the compound with an equal quantity of sand. Bardet adds water to a mixture of 50 grams barium dioxide with 60 of potassium permanganate. A little ozone in the oxygen is thus produced, but not in sufficient quantity to render it objectionable for respiration.

IODIDE OF NITROGEN.—There has always been some doubt about the formula of iodide of nitrogen. The Ch. and Dr. quotes Dr. Senhay, of Buda-Pest, who has succeeded in proving its composition to be NII₂, by replacing the hydrogen atom by sulphur. This sulphur compound is obtained by adding powdered oxide of sulphur or an ammonia solution of silver nitrate to nitrogen iodide suspended in water. It is a black, flaky substance in appearance.

KLORODYNE.—An English patent has been granted for a new and improved method of preparing chlorodyne, whereby it is made into a solution which does not separate into different parts. The new article is termed Klorodyne and is made after the following formula: Two parts morphine hydrochlorate, 1 part oil peppermint, 120 parts chloroform, and 30 parts ether are dissolved in 300 parts alcohol. This solution is then added to 24 parts glycerine. The parts directed are fluid parts, rather than parts by weight.

ANALGEN AND ANALGINE.—Notes on New Remedies, in answer to a query, indicates the difference between these substances. Analgen is a synthetic product, of antipyretic properties, chemically ortho-oxyethyl-ana-monoacetylamidochinolin. Analgin is a proprietary article, and there are two of it. One hails from Kansas, and is described as an analgesic, antipyretic and anodyne; the other claims to be "a combination of the active principles of Camellia Thea, Apium Graveolens, Saccharine and a Carbo-Hydrate."

PRESCRIBING BY TEASPOONFULS.—L. F. Bishop, M. D., writing to the N. Y. Med. Jr., says: "Before prescribing I ask the patient to select from among the spoons in my office one resembling that which he habitually uses. Then I hand the patient a four-fluid-ounce graduate and a bottle of water or of any handy fluid that is of about the same specific gravity as the medicine I intend to prescribe. Now the patient is instructed to pour out doses and place them in the graduate. When the fluid doled out reaches one or two fluid ounces I stop him, and write my prescription on the basis of five, six, seven, eight or nine doses to the fluid ounce, according to the number of doses to the fluid ounce he has placed in the graduate. I have been surprised at the constancy of the personal equation in this simple operation in each individual, and at the wide difference between individuals."

ACIDS IN VINEGAR.—A test for the detection of mineral acids in vinegar, recommended by Chem. Ztg., consists in the addition of one drop of a solution of 25 drs. of fuchsin in 100 cc. of 90 per cent alcohol to the vinegar contained in a porcelain capsule. If the vinegar be pure, the reddish-violet color of the indicator will be unchanged, but in the presence of mineral acids, the liquid acquires a dirty yellow tint. Neutralization with alkali will restore the color of the fuchsin.

ACTION OF SOLVENTS ON GERMICIDES.—Recent experiments have determined that certain solvents usually used with germicides have very decided effects in reducing the germicidal properties of these substances. Thus, absolute alcohol completely neutralizes the germicidal action of carbolic acid and corrosive sublimate with reference to anthrax, and it is necessary to add considerable water to the solution if the antiseptic property is to be restored. Olive oil renders carbolic acid and lysol inactive as disinfectants. Glycerine, if it contains less than 40 per cent of water, impedes the action of corrosive sublimate, and 10 per cent solutions of carbolic acid when they consist of less than 10 per cent of water. (Ph. Jr. through L'Un. Ph.)

PENCILS FOR BARBERS' ITCH.—Nat. Dr. extracts from Sem. Med. a formula for preparing pencils for the local treatment of barbers' itch. One part of rosin, seven parts of yellow wax, and six parts of olive oil are melted over gentle heat and then six parts of chrysarobin carefully stirred in. At the proper time pour into molds, making pencils of a convenient size. In using these pencils go over the entire affected surface with the point of the pencil. Avoid touching or smearing the hair. This is to be done at night just before retiring. Cover the part with some impermeable tissue to prevent staining the pillow and to guard against getting the chrysarobin in the eyes. In the morning remove the residue by rubbing with olive oil. Keep up the treatment until the surface becomes irritated, when it is suspended and every night zinc ointment is applied, removing the residue every morning with olive oil until all irritation has ceased. If the disease still exists, the treatment must be repeated.

ARTIFICIAL SUGAR.—Bradstreet's quotes from the Revue Industrielle to the effect that there is much excitement in the northern districts of France, where a great deal of beet-root sugar is manufactured, about a process for making sugar by the synthetical method, with lighting gas. The description of the process does not excel in its clearness. In a box, which is hermetically closed, is a porous partition on which a layer of "mousse de platine" is deposited. A current of lighting gas is allowed to enter into the box; condensation takes place, and the result at the other end of the box is a sugar which, according to our contemporary, shows all the "organoleptic" qualities (whatever that may be) of commercial sugar. Sugar made by this process would cost only a few centimes per kilogram. On the other hand, many eminent chemists hold that the problem of the synthetical production of sugar is far still from a solution, and that beet-root and sugar-cane will for a long time yet defy the attempts of replacing them by merely chemical methods.

EXAMINATION QUESTIONS.

This Department is for the publication of questions and answers from our readers; the object being to place before them questions for self-examination and to indicate the directions in which study can be profitably carried on.

We select questions to which replies are desired, particularly questions suggested by personal experience and study.

Correct Answers to the questions in each series will be published in a subsequent issue of the paper, as announced, together with the names of all persons sending us correct replies.

Write the Number of the series at the top of your reply and write on one side of sheet only.

Address—EDITOR PHARMACEUTICAL ERA,
BOX 583, DETROIT, MICH.

SERIES NO. 1.

Correct answers to these questions, together with the names of all persons answering correctly eight or more of them, will be published in our April 1st issue.

Replies should reach us not later than March 15th, 1894.

1. Give meaning of the term evaporate, and state the difference between evaporation and distillation.

2. What is the difference between a sediment and a precipitate.

3. Give the official fluid or liquid measures, their abbreviations, and their equivalents in minims. (By "official" is understood U. S. P.)

4. What is the official thermometer? Why is mercury especially adapted for use in thermometers? Convert—10° R. into degrees temperature official standard.

5. Write a prescription for a four-ounce emulsion containing 25 per cent of castor oil. Give all the ingredients to make an agreeable and homogeneous mixture, with directions for compounding.

6. What significance is attached to the terminations ate and ite in the nomenclature of salts?

7. Define fermentation. What is a ferment? Give examples (pharmacopoeial) of the products of fermentation.

8. How would you distinguish between morphine and quinine? Between corrosive sublimate and calomel?

9. Two ounces of distilled water at 15° C. will dissolve how many grains of each of the following? Potassium chlorate? Boric acid? Epsom salt?

10. State the difference between annual, biennial and perennial plants, and give an example of each.

ANSWERS TO SERIES NO. 1.

1.

Evaporation. To convert a substance into vapor by means of heat. In a general sense, evaporation signifies the separation of moisture from any body, whether liquid or solid. In pharmacy the term has a more restricted sense, signifying the liberation of a liquid below its boiling point and directly from the surface exposed to the air. In the form of a vapor, with a view to obtaining the less volatile portion. Evaporation is employed in the preparation of various extracts, scale salts, in the concentration of syrups, etc.

Distillation is the vaporization of a liquid or solid, followed by subsequent condensation of the vapor. As generally defined, it is a process for separating and condensing the volatile from the more fixed parts of a substance by means of heat. When the volatile matter condenses as a solid body, the process is called sublimation. When the process is

repeated a number of times to secure purity from less volatile matter, it is termed rectification. Destructive distillation refers to the decomposition of organic substances by heat and the condensation of their volatile constituents, while fractional distillation is the term employed to represent the successive separations, by distillation, of substances which vaporize at different temperatures.

2.

Sediment is solid insoluble matter separated by gravity from the liquid in which it has been suspended. A precipitate is solid matter separated or thrown down from a solution by means of light, heat, or chemical action. In a chemical sense, precipitation implies the production in the liquid by the action of a gas, solid, or other liquid, a new product which is insoluble in the solvent present.

3.

The official fluid or liquid measure is that of the metric system, the unit of which is the liter. The liter, rarely abbreviated, is equal to 10 deciliters, or to 100 centiliters, or to 1,000 milliliters. The terms milliliter, centiliter, and deciliter are rarely used; but the term cubic centimeter is generally employed to designate the one-thousandth part of the liter. In the pharmacopoeia it is understood to be synonymous with the term milliliter, and, when abbreviated it is written Cc. The liter is equal to 0.264,170,467 liquid gallon, or 33 fl. ounces and 306 minims, or 16,230.6 minims. The cubic centimeter is equal to 16.23 minims.

4.

The centigrade thermometer is declared to be the official thermometer, though in its absence the Fahrenheit thermometer may be employed. Mercury is especially adapted for use in thermometers in that it has a low specific heat, has practically uniform expansion between—36° C. and +109° C., opaque, does not adhere to glass, is easily obtained pure, is cheap. Its high boiling point and the low temperature at which it congeals (a range from about +359° C. to nearly —10° C.), and its rapid movement, it is admirably for the purpose. Its disadvantages are: it expands irregularly below —36° C. and above 109° C., solidifies at —40° C., and —40° F., and boils at 350° C. (662° F.). A temperature of —10° R. is equal to —12.5° C. or +9.5° F.

5.

An emulsion containing 25 per cent of castor oil may be made after one of the following typical formulas taken from the National Formulary, the proportions of the various ingredients being adapted, of course, to meet the requirements of the question in hand:

Castor oil	1 fl. ounce.
Acacia, in fine powder	2½ drams.
Tincture vanilla	45 minims.
Syrup	6 fl. drams.
Water enough to make 4 fl. ounces.	

Mix the syrup with ½ fluid ounce of water and triturate to a smooth paste. Then gradually incorporate with it the castor oil. Transfer the mixture to a bottle, add the tincture of vanilla, and enough water to make 4 fluid ounces. Finally, mix the whole thoroughly.

Second method.

Castor oil	1 fl. ounce.
Mucilage of Irish moss	1 fl. ounce.
Tincture vanilla	48 minims.
Syrup	6 fl. drams.
Water, enough to make 4 fl. ounces.	

To the mucilage of Irish moss, con-

tained in a suitable bottle, add the castor oil in divided portions, agitating each time until the last added portion has become emulsified. Then add the tincture of vanilla, the syrup, and enough water to make 4 fluid ounces. Finally, mix the whole thoroughly.

According to the National Formulary, emulsion of castor oil may also be prepared by other methods of emulsifying the oil, provided the vehicles and ingredients are compatible with the therapeutic employment of the preparation. In the absence of any specific directions of the prescriber, the work recommends that castor oil emulsion be only prepared either by means of Irish moss or by means of acacia.

6.

When two oxygen acids are formed by the same element, the name of the one containing the lesser proportion of oxygen terminates in "ous," the other in "ic;" thus $HClO_2$, chlorous acid, and $HClO_3$, chloric acid. The same rule applies to oxides and hydrates, if more than one is formed. If there is another oxygen acid of the same element which has less oxygen proportionately than the "ous" acid, "hypo" is prefixed; thus, $HClO$, hypochlorous acid. If another is present with more oxygen proportionately than the "ic" acid, "hyper" or "per" is prefixed; thus, $HClO_4$, perchloric or perchloric acid. Acids not containing oxygen have the prefix "hydro" and terminate in "ic;" thus H_2O , hydrobromic acid.

A salt is a chemical compound formed by the union of an acid and a base, and it takes its name from the acid employed in its formation. Then, oxygen-salts, if derived from acids terminating in "ous," are called "ites;" thus K_2SO_3 , potassium sulphite (derived from H_2SO_3 , sulphurous acid.) If they are derived from acids terminating in "ic," they are "ates;" thus, K_2SO_4 , potassium sulphate (derived from H_2SO_4 , sulphuric acid.) In a similar manner, the terminations "ic" and "ous," when applied to oxy-salts, show a two-fold combination, as ferrous sulphate, $FeSO_4$, and ferric sulphate, $Fe_2(SO_4)_3$, mercuric chloride, $HgCl_2$, and mercurous chloride, Hg_2Cl_2 . In this case "ous" means relatively more of the metal than in the "ic" combination. The termination "ous" is sometimes replaced by "sub;" as Hg_2Cl_2 , subchloride of mercury.)

7.

Fermentation may be tersely described as the molecular decomposition which certain complex organic materials undergo under the action of peculiar bodies called ferments. A ferment is an organic body capable of exciting, under favorable conditions, chemical changes in other organic bodies with which it is brought in contact. A very general law governing fermentation is that ferments excite chemical change in other bodies, without themselves undergoing chemical change. Farther all ferment products inhibit their respective ferments, and an accumulation of these products beyond a certain per cent will arrest the fermentation, and this cannot be re-established until the per cent of accumulation is reduced. Ferments are divided into two classes:

(a.) Organized or living, those which grow and multiply at the expense of the substances in which they occur, but only so long as the ferment is living. All of

them are low orders of plant life, and, excepting yeast, are bacteria.

(b) The inorganic ferments are non-living, nitrogenous bodies, produced within the body by the vital activity of the protoplasm of the cells. In this class are ptyalin, pepsin, the fat splitting and milk curdling ferments of the pancreatic juice, the diastatic ferment of the intestinal juice, and the various ferments found in the blood, chyle, liver, milk, etc., emulsin as found in various plants, etc. Alcohol, various wines, brandy, whiskey, etc., acetic and lactic acids, oil bitter almonds, volatile oil of mustard, are pharmacopoeial products of fermentation.

8.

Identity tests for morphine:

(a) One part is soluble in 21 parts of water.

(b) With solution of chloride of iron it gives a pale blue color, destroyed by acids or alcohol.

(c) Nitric acid produces with it a red color, changing to yellow.

(d) Chlorine water and ammonia water give a red color, changing to brown.

Identity tests for quinine:

(a) One part is soluble in 740 parts of water.

(b) Its solution in diluted sulphuric acid has a blue fluorescence.

(c) Treated with chlorine water, followed by an excess of water of ammonia, gives an emerald green color.

(d) Nitric acid does not redden it.

Identity tests for corrosive sublimate:

(a) One part is soluble in 16 parts of water, 3 parts of ether, and about 14 parts of glycerin.

(b) Has an acrid and persistent metallic taste.

(c) With ammonia water it yields a white precipitate, with an excess of hydrogen sulphide a black one, with potassium iodide a red one soluble in an excess of the reagent, and with silver nitrate test solution a white precipitate insoluble in nitric acid.

Identity tests for calomel:

(a) Insoluble in water, alcohol, and ether, and also in cold dilute acids.

(b) Odorless and tasteless.

(c) In contact with calcium hydrate test solution, or with solutions of alkali hydrates, or with ammonia water, the salt is blackened.

9.

A variety of answers may be obtained to this problem, depending, of course, upon what was understood by the "ounce" stated in the question. If the fluid ounce which the Pharmacopoeia of 1890 says is equivalent to 456.392 grains of water at 15° C is meant, then 2 fluid ounces of water at the same temperature will dissolve 54.65 grains potassium chlorate, 35.65 grains boric acid and 608.52 grains of Epsom salt. In these calculations, the solubilities for the respective substances as given in the 1890 Pharmacopoeia are taken, viz., potassium chlorate 1 in 16.7, boric acid 1 in 25.6, and Epsom salt 1 in 1.5 parts of water. Using the same table of solubilities and taking the ounce as 1 troy ounce of water, or 480 grains, two troy ounces of water will dissolve of potassium chlorate 57.48 grains, boric acid 37.5 grains, and of Epsom salt 640 grains. Taking the ounce to mean avoirdupois, or 437.5 grains, then two avoirdupois ounces will dissolve of potassium chlorate 52.39 grains, boric acid 34.17 grains, and of Epsom salt 583.23 grains.

Admitting the fluid ounce of water at

15° C to weigh 456.69 grains, as stated in the Pharmacopoeia of 1880, and using the solubilities of the respective substances given in the same work, two fluid ounces of distilled water will dissolve of potassium chlorate 55.23 grains, of boric acid 36.45 grains, and of Epsom salt 1,139.22 grains. Using the same table of solubilities and weighing out two troy ounces of distilled water, we find that there are dissolved of potassium chlorate 58.12 grains, boric acid 38.4 grains, and of Epsom salt 1,200 grains. Using the same table of solubilities (Pharmacopoeia 1880) and weighing out two avoirdupois ounces of water, we find there are dissolved of potassium chlorate 53.03 grains, boric acid 35 grains, and of Epsom salt 1,093.75 grains.

Note.—The Pharmacopoeia of 1880 gave the weight of a fluid ounce of distilled water as 455.69 grains, and the solubilities in water of potassium chlorate, boric acid and Epsom salt as 1 part in 16.5, 25, and 9.8 parts of water, respectively. These figures were changed in the Pharmacopoeia of 1890, the weight of a fluid ounce of distilled water being given as 456.392 grains, and the solubilities in water of potassium chlorate, boric acid and Epsom salt as 1 in 16.7, 25.6 and 1.5 parts respectively.

10.

The terms "annual," "biennial" and "perennial" are used in botany to designate the duration of plant life. An annual is a plant whose entire life is limited to a single season. It germinates from the seed in spring, attains its growth, blossoms, bears fruit, and dies in autumn. A biennial is a plant which germinates and vegetates, bearing leaves only, the first season, blossoms, bears fruit and dies the second. Perennial plants have an indefinite duration of life, usually of many years. They may be either herbaceous or woody. Herbaceous perennials, or perennial herbs, are plants whose parts are annual above ground and perennial below. In other words, their roots or subterranean stems live from year to year, sending up annually in the spring flowering shoots, which perish after they have ripened their fruit in autumn. Woody perennials usually vegetate several years, and attain nearly their stature before flowering; thenceforward they fructify annually, resting or sleeping in the winter. Chirata, colocynth, and pennyroyal are annuals; caraway, conium, coriander and digitalis, biennials; and arnica, belladonna, dandelion, and wormwood are perennials.

COMMENTS ON ANSWERS TO SERIES No. 1.

1. In reply to this question many employed the definition for the word evaporation given in some of our standard works on pharmacy. This definition is ordinarily adequate, but it is not sufficiently comprehensive to cover all cases. It states that evaporation is the separation, by means of heat, of the more volatile portion from the less volatile of a liquid. In the case of mixed liquids or solutions of solids, the definition is applicable, but not in the evaporation of simple liquids.

3. Many of the replies disregarded the fact that since January of the present year the new Pharmacopoeia, revision of 1890, has been the official standard. The official system of measures is now the metric, to the exclusion of all others.

4. The replies here have been of a uniformly satisfactory character, save that in a number of instances the writers failed to notice the minus sign before the 10° Reaumur (−10° R).

5. An emulsion is defined as a suspension of an oily or resinous body in an aqueous menstruum through the agency of a mucilaginous substance. Some of the answers submitted do not come within these requirements; thus, a mixture of glycerine and castor oil may afford a palatable method for the administration of the oil, but it is not a true emulsion. Again, it is hardly permissible to enumerate in the ingredients of this emulsion (as many do) such preparations as tincture of opium, paregoric, brandy, rum, whiskey, phosphoric acid, syrup of senega, etc. To be sure, such preparations are frequently prescribed in emulsions for their medicinal effects, but they should never be compounded with an emulsion unless specifically ordered by the prescriber.

7. Fermentation has been the subject of many and widely different theories, and it is not surprising that all kinds of definitions were received, ranging from those of past investigators down to the present time. Indeed, it is true that, even yet, no very satisfactory and comprehensive definition of fermentation and of ferments has been established, though the latest researches are in accord with the statements made in another column.

9. As was to be expected, a great variety of replies to this question were handed in. The solubilities of the salts are differently stated by different authorities, though preference should always be given to the official standard, that of the Pharmacopoeia. In the reply to this question, which is printed on this page, calculations have been based upon the Pharmacopoeias of 1880 and 1890, and upon the fluid, troy, and avoirdupois ounce, and no answers have been marked as incorrect which complied with either of these standards. The answers have emphasized the necessity for a good working acquaintance with common arithmetic, as quite a large proportion of the replies show that the principles of the calculations involved are not well understood.

10. This question almost without exception was satisfactorily answered.

SUCCESSFUL.

The following correctly answered eight or more of the questions in Series No. 1. **11**

- Jas. A. Adams, Waycross, Ga.
- Eugene Abuchon, Grenada, Kas.
- Frank R. Bacon, Sacramento, Cal.
- J. O. Baker, Savannah, Ga.
- Z. M. Ballard, Baltimore, Md.
- F. W. Bangs, St. John, Vermont.
- E. R. Barnes, Gillespie, Ill.

SERIES NO. 2.

Correct answers to these questions, together with the names of all persons answering correctly eight or more of them, will be published in our April 15th issue.

Replies should reach us not later than April 1st, 1894.

1. In the nomenclature of the Pharmacopoeia how are the titles of substances expressed?
2. What is effervescence? Deliquescence? Name two pharmacopoeial salts which effloresce. Two which are deliquescent.
3. Outline the official process for making syrup of wild cherry. Why is this process used? Upon what constituent does the virtue of this preparation depend? Why is glycerine used in the preparation?
4. Give the official title and the common and maximum doses of Kermes mineral, mercuric chloride, African pepper, tincture of opium, tincture of digitals, tincture cantharides. Which are toxic, and what are the antidotes?

5. Belladonna. Give the botanical name. Common name. Country indigenous to. What part is used? When should it be collected? What is the active principle? What is the dose of the powdered leaves? Of the principal alkaloid? Name the official preparations of belladonna.
6. What do you understand by a poison? An antidote? A dose?
7. Write correctly in Latin, without abbreviation, and state the quantities of each ingredient, a formula to make one pint of an elixir, of which each fluid dram is to contain 1 grain of quinine, 1.100 grain strychnine, and 2 grains phosphate of iron.

8. Write an equation showing the reaction which occurs in the preparation of syrup iodide of iron by the official process. Spirit Mindererus. Hydrated Alumina.

9. What is the difference between a hydrocarbon and a carbohydrate? Give an example of each.

10. What is an essential oil? Name several official ones, and state their properties and dose. How would you detect the addition of alcohol to an essential oil?

SERIES NO. 3.

Correct answers to these questions, together with the names of all persons answering correctly eight or more of them, will be published in our May 1st issue.

Replies should reach us not later than April 15th, 1894.

1. In what proportion must two quantities of powdered opium, containing 13.5 and 16 per cent of morphine respectively be mixed to produce 8 ounces of opium containing 14 per cent of morphine?

2. A quantity of official sulphuric acid

weighs 15 grams. How many cubic centimeters does it measure? A quantity of official nitric acid measures 25 cubic centimeters. How much does it weigh in grams? In grains?

3. How would you distinguish between a root and an underground stem?

4. Which contains the larger percentage of alcohol; a solution made from equal parts by weight of alcohol and water, or one made from equal parts by measure of alcohol and water?

5. What is the percentage of bromine and how many grains of bromine are there in one ounce of potassium bromide?

8. What is an alum, chemically considered? Write the chemical symbols for two alums not containing aluminum. Name the pharmacopoeial and other varieties of alum.

7. Complete the following chemical equations:

8. What is meant by the following prefixes used in the nomenclature of salts: Mono, bi, bin, tri, quadri, di, bis, ter, tetra, super, hyper, per, sesqui, sub, hypo, proto, ortho, meta, pyro, para.

9. What are the chemical differences between red and yellow oxides of mercury? Give the chemical formula for each.

10. Which contains the more quinine (alkaloid), quinine bisulphate or quinine sulphate? Give the percentage of quinine in each salt and exhibit the figures used in your calculations.

SERIES NO. 4.

Correct answers to these questions together with the names of all persons answering correctly eight or more of them, will be published in our May 15th issue.

Replies should reach us not later than May 1st, 1894.

- (1) How would you distinguish between carbolic acid and cresote?

- (2) What is a symbol, also what does a chemical formula represent?

- (3) How would you prove that the specific gravity of iron is 7.50?

- (3) Define stigma, and mention a drug which the pharmacopoeia directs shall consist wholly of stigmas?

- (4) How would you distinguish between galle and tannic acids?

- (5) Name the best excipient for a pill mass with each of the following: Essential oil, potassium permanganate, balsam copaiba, silver nitrate, corrosive sublimate.

- (6) How would you dispense the following prescription?

Ferrous sulphate..... 60 grains.

Potassium carbonate..... 36 grains.

Mix, and divide into 24 pills.

- (7) How many one-eighth grain doses should there be in one-eighth ounce bottle morphine sulphate as found in the market?

- (8) What is an alcohol chemically considered? Name those covered by your definition that are official in the United States Pharmacopoeia.

- (9) How would you prove the air to be a mixture and not a chemical compound?

- (10) What is the difference between benzoin and benzol?

NEW OXIDE OF ARSENIC.—Dr. Retgers believes, as a result of experiments, that there exists an oxide of arsenic of the composition As_2O .

FORMULARY AND QUESTION BOX.

The object of this department is to furnish our subscribers with reliable and tried formulas and to discuss questions relating to practical pharmacy, prescription work, dispensing difficulties, etc.

Requests for information are not acknowledged by mail and ANONYMOUS COMMUNICATIONS RECEIVE NO ATTENTION. TO INSURE ANSWER IN THE NEXT NUMBER, QUERIES SHOULD BE IN OUR HANDS *ten days* prior to the date of issue.

Unanswered Queries.

W. R. Guest, New York; J. Levinson and H. W. Mann, Buffalo; and F. V. Morloch, Baltimore, must send their addresses. The identity of the writer must be disclosed in all requests for information, otherwise no attention will be paid to them. See the rules printed at the head of this department.

6049. Blue for Show Globes.

(G. R. & Co.) See January 15, 1894, issue of the Era, page 64.

6050. Cheiving Gum.

(T. A. W.) See reply to query No. 5969, February 15 Era, page 160.

6051. Collapsible Tubes.

(F. E. B.) Write to A. H. Wirz, manufacturer, 913-917 Cherry st., Philadelphia, Pa.

6052. Head Oil.

(J. B.) In the reply to query 5390, September 1, 1893 Era, page 208, a number of formulas for this preparation are given and the subject otherwise very fully discussed.

6053. Dietary Treatment for Corpulent People.

(J. B. T.) This subject received considerable attention in the Era last year. We refer you to the issue of July 1st, 1893, page 10, and also that of December 15, 1893, page 550.

6054. Amyl Acetate in Gold Sizing.

(C. E. Z.) asks for a formula for gold sizing in which amyl acetate is used as one of the ingredients. Can any one of our readers furnish the information?

6055. Sal Sedativum Hombergii.

(P. Q. B.) This name was given boracic acid by Homberg, who first obtained it in 1702 by heating borax with copperas, and subsequently from borax and sulphuric acid. It retained the appellation until the time of Gay Lussac and Thénard in 1804.

6056. Anhydrous Ammonium Bicarbonate.

(W. E. M.) The sample you send purporting to be ammonium carbonate is anhydrous ammonium bicarbonate. It is not infrequently found upon the market mixed with the commercial article. It occurs in translucent, solid masses, devoid of odor, and is inferior to the official ammonium carbonate. It dissolves slowly in water at ordinary temperatures, giving off carbon dioxide.

6057. Chlorodyne.

(R. E. McC.) Here is a formula presented to the Michigan Pharmaceutical Association in 1892:

Chloroform	2 fl. ounces.
Ether	½ fl. ounce.
Tincture cannabis Indica	2 fl. ounces.
Tincture capsicum.....	1 fl. ounce.
Morphine sulphate.....	18 grains.
Oil peppermint.....	16 minims.
Hydrocyanic acid, dilute	1 fl. ounce.
Glycerine	2 fl. ounces.
Water	1 fl. ounce.
Alcohol, enough to make	16 fl. ounces.

6058. Essence of Pepsin.

(J. L.) Try one of the following:

(1.)	Pepsin	1 dram.
	Simple elixir	10 grams.
	Wine	1 ounce.
	Glycerine	¼ ounce.
	Water, enough to make	4 ounces.

(2.)

Pepsin in scales.....	1 ounce.
Cinnamon water	2 fl. ounces.
Caraway water	4 fl. ounces.
Hydrochloric acid	1 fl. dram.
Elixir calissaya	2 fl. ounces.
Glycerine,	16 fl. ounces.
Distilled water, enough	
to make	4 pints.

See also September 15, 1892 Era, page 173.

6059. Cleaning Bottles Which Have Contained Oils.

(G. R. & C.) Bottles which have contained fixed oils may be cleaned by allowing them to remain for some time in hot water, to which considerable soft soap and concentrated lye have been added. After becoming cool, the bottles should be thoroughly rinsed, at least two or three times, in clean water. Bottles which have contained volatile oils may be treated in the same way, but it is almost impossible to remove entirely the clinging and often disagreeable odors of some of them. Bottles so cleaned are almost entirely unfit for any purpose, unless it be for a like use to which they were first put, or to be used as containers for horse liniments, fatty oils, etc., where the adhering odor would not interfere.

6060. Extract of Lilac.

(C. P. T.) Piesse gives the following:

(1.)	Extract tuberosa	1 pint.
	Extract orange flower.....	¼ pint.
	Oil of bitter almonds.....	3 drops.
	Extract of civet.....	½ ounce.

This can be diluted with cologne spirit, or a mixture of spirit and water to the desired strength. The peculiar odor of lilac flowers is due to a liquid principle called terpineol, which also exists in many of the essential oils. It is obtainable in the market under the name of lilacine. This is probably used in the manufacture of some of the cheaper lilac odors upon the market, either alone or in connection with other ingredients. Here is a formula:

(2.)

Lilacine.....	1 ounce.
Alcohol	1 pint.

A careful search has failed to reveal a formula for the other odor you name.

6061. Tannic's Reagent for Albumen Testing.

(S.S.H.) Jennings' Practical Urine Testing gives the following formula:

Potassium iodide	3.32 grams.
Mercuric chloride	1.35 grams.
Distilled water	64 cc.
Acetic acid	20 cc.

Millard's test for albumen in the urine is given in the work quoted as a mixture of nitric acid, one volume, with a cold saturated solution of magnesium sulphate, five volumes. To use, pour 30 minims of the reagent into a test tube, carefully overlay this with 60 minims of the urine. If albumin is present a white ring forms at the plane of contact of the two fluids. The advantages claimed for this reagent over pure nitric acid are, 1st. It is not corrosive, and does not stain the fingers, or produce a coloration with io-

dides. 2d. Its great density makes the reaction an exceedingly sharp one, so that the test has even greater delicacy than where pure nitric acid is used.

6062. Flavoring Extracts From the Fruit.

(W.) Banana.

Banana fruit (peeled)....	1 pound.
Alcohol	1 pint.
Water	1 pint.

Macerate for 14 days; express and strain.

(2.) Peach.

Bruised peach pits.....	4 drams.
Oil bitter almonds.....	2 drams.
Diluted alcohol	16 ounces.

Macerate 48 hours and filter.

(3.) Pineapple.

Grated pineapple	16 ounces.
Alcohol	6 ounces.

Macerate 48 hours in a covered vessel, and strain, adding enough water through the strainer to make the liquid measure 1 pint.

(4.) Raspberry.

Upon 50 pounds of the fresh and cleaned berries pour 14 gallons of 85 per cent alcohol. Let it stand for 24 hours, then add about 6 gallons of water, and distill off 13 gallons.

(5.) Strawberry.

Bruise ½ pounds of strawberries; pour 3 quarts of alcohol over the mass, let it stand for some time and filter. The product will make about a gallon of the extract. See also reply to query No. 6045 in March 15 Era.

6063. Prescription Difficulty.

(Drugs) has been unsuccessful in making an emulsion from the following prescription:

Paregoric	6 drams.
Castor oil	1 ounce.
Compound tincture car-	
damom	1 ounce.
Aromatic syrup rhubarb.	1 ounce.

The difficulty is due to the large proportion of alcohol present and so little water. So small an amount of the latter is insufficient to completely emulsify the mixture with any of the ordinary emulsifying agents. We suggest he read the remarks and the typical formulas for a similar emulsion given in the department of examination questions in this issue. By omitting the compound tincture of cardamom, and substituting for it one of the aromatic waters and using either of the processes referred to, he will have no difficulty in making a presentable emulsion. Or, in place of an aromatic water, use plain water and flavor with one of the emulsion flavors given on page 40 of the National Formulary.

6064. Bismuth Subgallate.

(H. C. W.) Under the trademarked name "Dermatol" bismuth subgallate was introduced into medicine as a substitute for iodoform. A process for its preparation has been patented, and it is thus described on page 329, vol. 63 Patent Office Gazette. Neutral nitrate of bismuth is dissolved in diluted nitric acid, a solution of gallic acid, alcohol and water added and to the resulting mixture, another addition of caustic alkali or alkali carbonate, until the whole remains but slightly acid. The mixture is then precipitated by means of sodium acetate, or by diluting with water. Another process is described in the National Dispensatory recently issued. In addition to its external employment as a substitute for iodoform, it has been used with some degree of success in the treatment of in-

testinal diseases, especially in profuse diarrhoea caused by catarrhal and ulcerative processes of the mucous membrane. It may be administered in doses of 30 to 50 grains daily, in powders containing 4 to 8 grains each, either alone, mixed with half to 1 grain of powdered opium, or suspended in emulsion to which a few drops of tincture of opium have been added. It is sometimes prescribed in fermentative dyspepsia.

6065. Decolorizing Oil of Rose

(Quercus) has about a pound of oil of rose which has turned brown. When the original container, a two pound can, was opened, the oil was perfectly clear. The container was corked with a rubber stopper. He wants to know how to decolorize the oil. The coloring may be due to an oxidation of the oil, or partially or wholly to the solvent action exerted by the oil upon the rubber stopper, as rubber is soluble to a certain extent in some of the volatile oils. Try, in an experimental way, agitating a small quantity of the oil with a little recently heated animal charcoal. Or experiment with Overbeck's method of freeing volatile oils from coloring matter by simply distilling with an equal quantity of poppy seed oil and a saturated solution of common salt. Oil of rose is found upon the market in nearly all shades of color, from a light yellow to a red. Many experts state that color is no criterion of value, and if this be the case, and the odor of the sample is unimpaired, it is a question whether it would be worth the trouble and loss which would inevitably result from any attempt to decolorize the oil.

6066. Prescription Query.

(Lyccon) asks how the following prescription would behave if it were put up in a hurry and when finished, what does the patient get?

Potassium bicarbonate, 1 dram.
Salicylic acid 1 dram.
Potassium iodide 1 dram.
Tincture colchicum seed 2 drams.
Tincture elmlicifuga..... 3 drams.
Syrup orange peel..... 2½ ounces.
Water, enough to make 4 ounces.

It is not advisable to compound this prescription in a hurry. The potassium bicarbonate should be dissolved in about 1 dram of water, the salicylic acid added and the mixture set aside until effervescence has ceased. The potassium iodide is dissolved in the syrup of orange peel and added to the former mixture. The whole is then transferred to the bottle, the tinctures of colchicum seed and elmlicifuga added, and enough water to make up to 4 ounces. If the mixture were hurriedly put together and bottled at once before effervescence has ceased, an explosion is quite likely to take place, causing the bottle to break, the contents to be lost and the patient to get nothing. The intentions of the prescriber are evidently to prescribe an anti-rheumatic mixture. The first reaction which takes place is the formation of potassium salicylate by the interaction of potassium bicarbonate and salicylic acid. Rather more potassium bicarbonate is prescribed than actually necessary to just neutralize the salicylic acid. There may also occur a reaction between the constituents of the tinctures and the potassium iodide but it would cut but little figure in the present instance.

6067. Venice Blacking.

(Inquisitive.) The following has been given as the formula: To 1 gallon

rectified spirit is added 21 drams blue aniline and 31 drams Hismarck brown aniline; the solution of the last two being effected by agitation for eight to twelve hours. After the solution is completed the mass is allowed to settle, and the liquid portion is drawn off by spigots above the sediment and filtered if necessary. The alcohol is placed in the apparatus first, then the colors, and the mixture agitated every hour for a space of 10 or 15 minutes. Of this liquid 1-4 gallon is added to 1 gallon of rectified spirit, and in this are dissolved 11 ounces of camphor, 16 ozs. Venice turpentine, 36 oza. shellac. To 1 qt. benzine add 3 1-2 fluid ounces castor oil and 1 3-5 fluid ounces boiled linseed oil. The two solutions are then united by agitation, but should not be allowed over two days in any vessel of iron or zinc, as in the presence of the guma the colors will be decomposed by contact with zinc in eight days, and with iron in eighteen to twenty-four days.

In addition to the preceding we give another formula which has been brought forward as producing a similar blacking:

Shellac 50 grains.
Venice turpentine 40 grains.
Solid blue black "B" 15 grains.

In a mixture of

Alcohol 2 fl. ounces.
Gasoline 6 fl. drams.

6068. Color Change in Elixir Pepsin, Bismuth and Strychnine.

(Quercus) asks what causes elixir of pepsin, bismuth and strychnine to become black and how it may be clarified? Elixir of pepsin, bismuth and strychnine is very susceptible to change, and we suspect that the turbidity noticed is due to the loss of ammonia necessary to hold the bismuth in solution. This elixir should be, at all times, strictly neutral. The salt of bismuth used in its preparation is the ammonio-citrate, and it is soluble in water only so long as it preserves its alkalinity. This is accomplished by means of ammonia water. When this evaporates, or when the preparation is acidulated, the bismuth is thrown down. Now, a word as to the formula in general. It is a fact that pepsin cannot be combined in alkaline mixtures without becoming inert, and should only be used in acid mixtures; hence, it is a question if the therapeutical value is not sacrificed, for the so-called clear and elegant preparations. The only suggestion we can make is for you to follow the formula given in the National Formulary as closely as possible, keeping the reaction as nearly neutral as possible, carefully avoiding an excess of ammonia. By reading over the formula in the National Formulary and carefully following it in outline you will readily see the application of these remarks, and we predict that you will have no trouble in making a presentable preparation out of a rather incompact one. It is only necessary to remark that the elixir may sometimes be cleared up by the addition of a few drops of ammonia.

6069. Jewelers' Falls.

(F. E. Y.) These are made of copper tin, silver, or combinations of two of them and colored. They are used at the back of transparent gems, especially artificial stones to brighten the brilliancy and luster. Some kinds of foil are made by rolling sheet metal to the requisite thickness, others by forming a solid cylinder of the metal and then slicing off a

film while the cylinder rotates. Jewelers' falls are further prepared by coloring, varnishing and polishing. If the color of the stone requires modifying, a foil of lighter or darker color is used. The white foil is colored in the following manner.

Blue.—Turnbull's blue is rubbed up with very pale, quick drying oil, until the desired shade is obtained. This blue is used to impart a darker color to sapphires.

Green.—Dissolve shellac in alcohol, and add sufficient verobaris to the solution to produce the desired tint.

Red.—A solution of carmine in ammonia or lacquer, or carmine rubbed up with isinglass, may be used. The tint in either case, can be modified by mixing, and the luster augmented after the color has been applied by lacquering.

Yellow.—Solution of mastic and turmeric in alcohol, or a solution of saffron and isinglass may be used.

For imitation diamonds, cover the inside of the socket in which the stone or paste is to be set with tin foil, using a little stiff gum or size. When dry polish the surface, heat the socket, fill it with warm quicksilver, let it rest for 2 or 3 minutes, pour it out, and gently fit it in the stone. Lastly, well close the work around the stone, to prevent the alloy being shaken out. Or, coat the bottom of the stone with a film of real silver by precipitating it from a solution of the nitrate in spirits of ammonia by means of the oils of cassia and cloves. Both of these methods are used to increase the brilliancy of real and fictitious gems.

6070. Luminous Paints.

(H. W. G.)

The following are some recipes for the preparation of luminous paints:

For orange luminous paint, 46 parts varnish are mixed with 17.5 parts prepared barium sulphate, 1 part prepared India yellow, 1.5 parts prepared madder lake, and 38 parts luminous calcium sulphide.

For yellow luminous paint, 48 parts varnish are mixed with 10 parts prepared barium sulphate, 8 parts barium chromate, and 34 parts luminous calcium sulphide.

For green luminous paint, 48 parts varnish are mixed with 10 parts prepared barium sulphate, 8 parts chromium oxide-green, and 34 parts luminous calcium sulphide.

A blue luminous paint is prepared from 42 parts varnish, 10.2 parts prepared barium sulphate, 6.4 parts parts ultramarine blue, 5.4 parts cobalt blue, and 46 parts luminous calcium sulphide.

A violet luminous paint is made from 42 parts varnish, 10.2 parts prepared barium sulphate, 2.3 parts ultramarine violet, 9 parts cobalt arsenate, and 36 parts luminous calcium sulphide.

For gray luminous paint, 45 parts of the varnish are mixed with 6 parts prepared barium sulphate, 6 parts prepared calcium carbonate, 0.5 part ultramarine blue, 6.5 parts gray zinc sulphide.

A yellowish-brown luminous paint is obtained from 48 parts varnish, 10 parts precipitated barium sulphate, 8 parts auripigment, and 34 parts luminous calcium sulphide.

Luminous colors for artists' use are prepared by using pure East India poppy oil, in the same quantity, instead of the varnish, and taking particular pains to grind the materials as fine as possible.

For luminous oil color paints, equal quantities of pure linseed oil are used in the place of the varnish. The linseed oil must be cold pressed and thickened by heat.

All the above luminous paints can be used in the manufacture of colored papers, etc., if the varnish is altogether omitted, and the dry mixtures are ground to a paste with water.

The luminous paints can also be used as wax colors for painting on glass and similar objects, by adding, instead of the varnish, 10 per cent more of Japanese wax and one-fourth the quantity of the latter of olive oil. The wax colors prepared in this way may also be used for painting upon porcelain, and are then carefully burned without access of air. Paintings of this kind can also be treated with water glass.

See also Era of December 15, 1893, page 573.

6071. Syrup White Pine Compound.

- Balm Gilead buds..... 5½ ounces.
- Spikenard 5½ ounces.
- Blood root 5½ ounces.
- White pine 20 ounces.
- Wild cherry 49 ounces.
- Ipecac 4 ounces.
- Acetate morphine 2 drams.
- Alcohol, 1 part.....
- Water, 2 parts..... q. s.

Reduce the drugs to coarse powder, macerate 12 hours, using quantity sufficient of the menstruum to percolate to 24 pints. In this dissolve 24 pounds sugar by percolation and ½ gallon confectioner's glucose. Dissolve the morphine in 8 ounces of water and add sufficient acetic acid to remove turbidity. Mix with syrup, add the chloroform and agitate well. Add lastly enough simple syrup to make 40 pints.

If a combination with tar is thought desirable, ½ ounce of glycerite of tar, N. F., can be added to each pint.

A similar syrup may be made by first preparing a tincture of white pine, as follows:

- White pine turpentine (gum thus) 2 av. ounces.
- Alcohol 14 fl. ounces.

Cut the gum in small pieces and dissolve in the alcohol by the aid of a water bath, or by macerating for two weeks in a warm place.

Compound Syrup of White Pine.

- Sulphate of morphine... 5 grains.
- Fluid extract of Ipecac. ½ fl. ounce.
- Chloroform 1 fl. dram.
- Tincture white pine..... 2 fl. ounces.
- Carbonate magnesium . . ½ av. ounce.
- Water 8 fl. ounces.
- Sugar 14 av. ounces.

Rub the carbonate of magnesium with 1 ounce of sugar to a fine powder in a mortar, and add to it the tincture of white pine, rubbing them thoroughly together, then add the fluid extract, gradually rub the water with the mixture, and filter; mix the chloroform with the sugar in a bottle, dissolve the morphine in the liquid, then mix the liquid with the sugar in the bottle and dissolve by agitation.

Here is a formula first published in 1884, in the Proceedings of the Illinois Pharmaceutical Association under the title "White Pine Expectoant":

- White pine bark 1 ounce.
- Wild cherry bark 1 ounce.
- Balm Gilead buds..... 1 dram.
- Blood root 1 dram.
- Sassafras 1 dram.
- Chloroform 1 dram.

- Alcohol 4 ounces.
- Water 4 ounces.
- Dextrin syrup 8 ounces.

Exhaust the drugs with alcohol and water in equal proportion, by percolation, until 8 ounces are obtained. To this add the dextrin syrup and chloroform and mix thoroughly.

6072. Flavoring Leaf Tobacco.

(1.)

Moisten 50 parts of Virginia leaf before cutting with the following mixture: Dissolve 2 parts of sugar in 24 parts of water and add 1-10 part of cinnamon wine, 1-20 part extract of mastic and 2 parts of juniper wine. The tobacco, after moistening, is pressed into a barrel, remaining there 24 hours, when it is cut and packed.

(2.)

Moisten 100 parts of Virginia leaf with the following mixture, obtained by boiling for 3 hours: Raisins, 3 parts; bay-leaves ½ part, and pulverized cascarrilla ¼ part in water 80 parts. Let the decoction cool and strain the liquor through a linen cloth, and then add 4 parts of cinnamon wine and 1½ parts of sugar. The tobacco, after moistening, is dried and cut.

(3.)

Pulverize dried plums 20 parts, tamarinds 15 parts, cassia bark 5 parts, figs 10 parts and juniper berries 30 parts. Macerate in 225 parts of water for 24 hours and add to the resulting liquor: juice of Spanish licorice 30 parts, molasses 20 parts, honey and saltpeter each 10 parts. A sufficient quantity to flavor 500 parts of ordinary American leaf tobacco.

(4.)

The Techno-Chemical Receipt Book gives this for flavoring Porto Rico leaf: Boil in a covered boiler for 3 hours best wine vinegar 12 parts, water 90 parts, honey 1 part, large raisins 3 parts and bay leaves ¼ part. Filter the liquor and, when cooled to milkwarm, treat with it 100 parts of Porto Rico leaf.

(5.)

Sweet Tobacco, English Process: Remove the lower thick stems from 100 parts of Virginia leaf, moisten with 60 parts of water, cut fine and kiln-dry. In the meanwhile boil the following ingredients in 10 parts of water: Sugar 3 parts, raisins 2 parts and cascarrilla bark ¼ part. Strain the liquor when about milk-warm through a linen cloth, and when it is entirely cold add 1 part extract of mastic and ½ part of cinnamon wine. Moisten the tobacco with this mixture and then pack in paper or linen bags.

(6.)

Sweet-scented Tobacco. For 100 pounds ordinary tobacco: Comminute 4 pounds of dried prunes, 2 pounds each of orange peel and rosewood, 1 pound of coriander seed and 2 pounds of raisins; pour over them 8¾ ounces of purified potash and let the whole stand 24 hours; then heat it nearly to the boiling point, draw off the liquor and press out the residue; dissolve in the liquor 2 pounds of purified saltpeter, 4 pounds each of common salt and honey. Pour 40 pounds of this mixture over 100 pounds of the prepared tobacco.

(7.)

Here are two processes for improving the flavor of inferior qualities of tobacco: For 100 pounds comminute cassia bark, orris root, licorice root, angelica root and rosewood each 7 ounces. Macerate with 4 gallons of water, press out the

liquor and compound it with a solution of 2 pounds of pure saltpeter and 3¼ pounds of white sugar in 1½ gallons of water.

(8.)

Fresh lemon peel and fresh orange peel of each 8¾ ounces, cubeb 3½ ounces, calamus root and coriander seed each 7 ounces, and figs 1¼ pounds; macerate 24 hours in 4 gallons soft water, strain off the liquor and dissolve in it 2 pounds of sugar syrup and 1¼ pounds of pure saltpeter.

See also Era Formulary, page 415.

6073. Liquid Fire Extinguisher.

(J. H.) Here are several formulas:

(1.)

Make the following solutions: 1. Ammonium chloride, 200 parts; water, 20,000 parts. 2. Alum calcined and pulverized, 350 parts; water, 10,000 parts. 3. Ammonium sulphate, in powder, 3,000 parts; water, 500 parts. 4. Sodium carbonate, 350 parts; water, 4,000 parts. 5. Sodium carbonate, 350 parts; water, 5,000 parts. 6. Liquid water-glass, 4,500 parts. Mix the solutions in the order named, and to the mixture add 20,000 parts of water.

(2.)

Crude calcium chloride 20 parts, salt 5 parts, dissolved in water 75 parts. Keep at hand and apply with a hand pump.

(3.)

Solution for Hand Grenades: Fill thin, spherical bottles of blue glass with a solution of calcium chloride, sal ammoniac or borax.

(4.)

The "hand grenade" known as Hayward's is said to be charged with a solution containing calcium chloride, 18.4; magnesium chloride, 5.7; sodium chloride, 1.3; potassium bromide, 2.2; barium chloride, 0.5; and water, 72.2 parts. Whether the solution is made by dissolving the separate salts, procured as such, in water or whether some liquid waste product of some chemical factory is made the basis of it is not stated. Another is said to be composed of ground marble, sulphuric acid and water. The acid and water are mixed in the proportion of two parts of acid to six parts of water, are put in the bottles and then about 8 ounces of ground marble to each pint of the liquid put in and the bottles instantly corked and tied down; when thrown into a fire the bottles are broken or burst by the heat, liberating the carbonic acid and thus extinguishing the fire.

(5.)

A good fire extinguisher that may be conveniently kept in ordinary one-headed barrels around buildings is prepared as follows: Sixty pounds salt, 30 pounds alum and 10 pounds sal-soda are dissolved in 13 gallons of water. This preparation acts by generating carbonic acid gas and by forming a non-fusible crust over the burning timbers as soon as it is thrown into the fire. In preparing the solution all materials used should be pulverized and the water should not be above lukewarm. By heating the mixture to hasten the solution a considerable part of its fire-extinguishing properties would be lost. Sulphate of ammonia is also an excellent fire extinguisher, because it will melt at a low degree of heat and produce a crust over the burning materials. At higher temperatures it will be decomposed and give off vapors of superior fire-extinguishing properties. It is advisable to also have handy any substance that may be used to choke

the fire. A material far better adapted than water to smother an incipient fire is ordinary sand. For instance, if oily waste or other material saturated with oil should catch fire, a few handfuls of sand will do more to extinguish the fire than several pails full of water. Another advantage of sand is that it will do no damage itself like water to materials it is thrown upon. It is necessary to often change the water kept in barrels for fire extinguishing, this is avoided by using sand instead.

(6.) The Techno-Chemical Receipt Book gives the following formula for "cart-ridges" for extinguishing fire: Make the shells of parchment paper or sheet lead and fill them with 4 parts of a snit obtained by mixing 343 parts of sulphate of aluminum and 142 parts of sodium sulphate with 432 of water, and 1 part of sodium sulphide, separated from the 4 parts of the snit by a disk of parchment paper. The cartridge is broken and its entire contents are poured into the water to be used for extinguishing the fire.

FORMULAS.

6074. Compound Syrup of Tar.

Am. Drug.

Fluid extract of licorice. 2 ounces.
Tincture opium camphorated 2 ounces.
Syrup ipecac 2 ounces.
Glycerite tar, N. F. ½ ounce.
Syrup tolu, enough to make 1 pint.

By using one-half the quantity of liquid extract of licorice a much nicer preparation can be obtained.

6075. Syrup Wild Cherry Compound.

Am. Drug.

Wild cherry 16 ounces.
Spikenard 4 ounces.
Ipecac 3 ounces.
Bloodroot 1 ounce.
Tincture opium 4 ounces.
Alcohol, 1 part
Water, 2 parts q. s.

Macerate 12 hours and then percolate to 5 pints. Add the tincture opium and filter; then dissolve 6 pounds sugar in filtrate by percolation and add enough simple syrup or glycerine to make 1 gallon. Tar can be added, if desired, as in the preceding formula.

6076. Compound Aromatic Syrup of Senna.

Griffith's Formulary.

Alexandria senna 4 troy ounces.
Jalap ½ troy ounces.
Rhubarb ½ troy ounce.
Cinnamon 1 dram.
Cloves 1 dram.
Nutmeg 30 grains.
Oil lemon 20 minims.
Sugar 24 troy ounces.

Reduce the crude drugs to a number 50 powder and percolate with diluted alcohol until the powdered drugs are exhausted. Evaporate by means of a water bath to 15 fluid ounces, filter, dissolve the sugar, and add the oil.

Dose, 2 to 4 fluid drams.

6077. Compound Wine of Cinchona.

French Codex.

Yellow cinchona 10 parts.
Bitter orange peel 1 part.
Chamomile 1 part.
Alcohol 10 parts.
Stronger white wine 90 parts.

Bruse the crude drugs and macerate in the alcohol and wine ten days. Filter. Dose, a tablespoonful.

6078. Coughs in Children.

Wine antimony 3 minims.
Syrup squilla 5 minims.
Syrup ipecac 5 minims.
Morphine sulphate 1-64 grain.
Brown mixture, enough to make 1 fl. dram.
Give every two hours.

6079. Cod Liver Oil (Predigested) With Malt Extract.

Ch. & Dr.

Cod liver oil 150 parts.
Water 50 parts.
Scale pancreatin (soluble) 1 part.
Sodium chloride 2 parts.
Sodium bicarbonate 2 parts.

Dissolve the pancreatin along with the salines in the water, digest at a temperature of about 90° F. for three hours, stirring occasionally. Put 200 parts of any good commercial extract of malt in a mortar, add the pancreatized oil gradually, and flavor with oil of pimento, quantity sufficient.

6080. Palmer's Compound Tonic of Saffron.

A. P. A.

Senna leaves 1 ounce.
Manna 1 ounce.
Colocynth ½ ounce.
Saffron 2 drams.
Powdered opium 10 grains.
Boiling water 12 ounces.
Infuse until cold and add:
Tincture of aloes and myrrh 8 ounces.
Makes 1 pint.

6081. Coughs in Children. Stimulant Expectorant.

Ammonium chloride 3 grains.
Syrup senega 5 minims.
Syrup wild cherry ½ fl. dram.
Brown mixture ½ fl. dram.
Give every three hours.

6082. Cough Mixture.

Essence anise 1 dram.
Aromatic sulphuric acid. 3 drams.
Glycerine 1 ounce.
Wine ipecac 1 ounce.
Oxymel of squills. 2 ounces.
Camphor water, enough to make 8 ounces.

6083. Cough Sedative Without Opium.

Potassium bromide 1 ounce.
Tincture bloodroot. 3 fl. drams.
Tincture hyoscyamus. 2 fl. ounces.
Ether ½ fl. ounce.
Syrup ipecac 2 fl. ounces.
Syrup tolu 7 fl. ounces.
Alcohol 1 fl. ounce.
Water 3 fl. ounces.

Dissolve the bromide of potassium in the water and mix the solution with the syrups. Mix the alcohol with the ether and tinctures and add to the other solution.

6084. Fumigating Pastilles.

Beral.

Benzoin 10 parts.
Charcoal 24 parts.
Potassium nitrate 1 part.
Sassafras 2 parts.
Muclage of acacia, a sufficient quantity.

Make conical pastilles.

6085. Butter of Cacao Mixture.

Cadet.

Butter of cacao 3 ounces.
Oil of almonds. 13 ounces.
Syrup of red popples. 1 ounce.
Orange flower water. 4 drams.

In teaspoonful doses as a soothing demulcent in catarrh.

6086. Tincture Caulophyllum Compound (Blue Cohosh Compound.) Amer. Dispensatory.

Blue cohosh 2 ounces.
Ergot 1 ounce.
Water pepper (smartweed) 1 ounce.
Oil savin 30 minims.
Alcohol, enough to make 24 ounces.
Macerate or percolate.
An emmenagogue given in 15 to 60 min-
im doses.

6087. Whoop Tonic Bitters.

Fluid extract whoop. 1 fl. ounce.
Fluid extract calamus. ½ fl. ounce.
Tincture cinnamon 1 ounce.
Tincture cardamom ½ fl. ounce.
Compound spirit orange (N. F.) 1 fl. dram.
Whiskey 3 pints.
Water 12 ounces.
Glycerine 4 ounces.
Mix and allow to stand for several days, then filter. Dose, one-half to one wineglassful.

6088. Lotion for Burns.

Benzoin 6 drams
Storax 4 drams.
Balsam tolu 2 drams.
Aloes 1 dram.
Alcohol 5 fl. ounces.
Make a tincture, to be used as a lotion for burns and scalds, before vesication has taken place.

6089. Burns in Children. Nouveaux Remedes.

Lime water 1½ ounces.
Oil sweet almonds. 1½ ounces.
Thymol 1 to 2 grains.

6090. Burns in Children. Nouveaux Remedes.

Bismuth subnitrate. ½ dram.
Boric acid 1 dram.
Lanolin 2 drams.
Olive oil ½ ounce.

6091. Ointment for Chilblains.

Zinc oxide ½ dram.
Lead acetate 1 dram.
Glycerine 1 dram.
Prepared lard 4 ounces.
Perfume, as desired.
Triturate the zinc oxide and lead acetate with the glycerine, add the lard and finally the perfume.

6092. Ointment for Chilblains.

Camphor 1 dram.
Oil turpentine 2 drams.
Olive oil 4 drams.
Ointment of nitrate of mercury 1 ounce.

Dr. Kerez, of Rome, announces that there is no danger in becoming infected with tuberculosis from smoking cigars made by people who are afflicted with that disease. Even should such cigars become filled with these disease germs, their infective qualities are destroyed after a period of ten days or two weeks.

Comparison of the capabilities of the hop-raising districts of Oregon and Washington with those of European countries, shows that land in the Puyallup Valley, Washington, will, upon an average, produce 1,700 pounds per acre, while the most favored hop-producing sections of England and Germany hardly furnish a yield of 600 pounds per acre. It is estimated that it costs twenty cents per pound to grow and cure hops in England; those grown in the state of New York cost the producer about thirteen cents per pound, while estimates from the Pacific coast show that hops can be grown there at a cost of about nine cents per pound.

NEWS COMMENT.

In Muncie, Ind., a "veteran cab driver" has opened a drug store.

Sulphuric acid was dispensed instead of a face lotion by a clerk in a Halifax drug store.

Mount's drug store at Monett, Mo., is now in charge of A. C. Smith, who comes from Canton, O.

Eight complaints for illegal liquor selling have been lodged against a druggist in Hoagland, Ind.

The Sandusky, O., Druggists' Association has elected Chas. A. Lehrer, president, and Adam Gerlach, secretary.

The inventor of ice cream was one Jackson, a negro, in Philadelphia, who accumulated a fortune in the business.

A druggist in Belle Plaine, Ia., is charged with administering narcotics to a woman for the purpose of debauching her.

Mrs. Lucy H. Collar has instituted suits for damages against four druggists of Cedar Rapids, Ia., for selling liquor to her husband.

Mrs. Mary Eccles, who conducts a drug store in Brooklyn, N. Y., objects to the opening of a saloon on the opposite side of the street.

Wm. Schmidt has withdrawn from the Indianapolis wholesale drug firm of A. Kiefer & Co., which now becomes the A. Kiefer Drug Co.

The postmaster and his mother at Chatham, N. Y., have been heavily fined for selling liquor in their drug store, where the postoffice is.

Two druggists and a dentist in McKeesport, Pa., were arrested and fined for forcibly detaining a young girl in a room over the drug store.

The Erie Chemical Co., at Erie, Pa., is a new and large concern which will manufacture heavy chemicals, especially chloride of lime.

A patent medicine vender was fined under a city ordinance at Omaha for distributing advertising matter without a license. On appeal the decision of the Police Court was reversed, the judges holding that the ordinance infringes on a man's constitutional liberty.

Harry A. Robinson, a drug clerk employed by Nelson Barrowclough, a Rochester, N. Y., druggist, is charged with selling drugs without a license from the State Board of Pharmacy. It is said he bought a certificate from a druggist at Avon and had his name inserted over the old one.

Frederick Uhlmann, a druggist, of Passaic, N. J., had a miraculous escape from death at the Erie station a few evenings since. An express train, running at the rate of about thirty-five miles an hour, struck him and turned him over and over several times. He was not injured. One of his shoes was torn from his foot by the pilot of the engine, but his spectacles, which rested on his nose, were not disturbed during his somersaults.

JOIN THE A. P. A.

What are the aims of this association and what are the advantages of membership in it? The purpose of the association is to unite the educated and reputable pharmacists and druggists of America in the following objects:

1. To improve and regulate the drug market, by preventing the importation of inferior, adulterated, or deteriorated drugs, and by detecting and exposing home adulteration.

2. To encourage proper relations between druggists, pharmacists, physicians, and the people at large, which shall promote the public welfare, and tend to mutual strength and advantage.

3. To improve the science and art of pharmacy by diffusing scientific knowledge among apothecaries and druggists, fostering pharmaceutical literature, developing talent, stimulating discovery and invention, and encouraging home production and manufacture in the several departments of the drug business.

4. To regulate the system of apprenticeship and employment, so as to prevent, as far as practicable, the evils flowing from deficient training in the responsible duties of preparing, dispensing, and selling medicines.

5. To suppress empiricism, and to restrict the dispensing and sale of medicines to regularly educated druggists and apothecaries.

6. To uphold standards of authority in the education, theory and practice of pharmacy.

7. To create and maintain a standard of professional honesty equal to the amount of our professional knowledge, with a view to the highest good and greatest protection to the public.

Every pharmacist of good moral and professional standing is eligible to membership.

The annual dues are \$5 and every member in good standing is entitled annually to the proceedings of the annual meeting, including the various papers read and discussed, and also the report on the progress of pharmacy, which latter is a thorough digest of every thought and labor in the pharmaceutical world. This volume is alone worth the amount of the annual contribution and in the course of years becomes a most important part of the pharmacist's library. This year the association will meet during the month of September at that most delightful mountain resort, Asheville, North Carolina, so well and favorably known to all tourists. It is hoped that a large attendance of new members will be present. The special committee on membership solicits your application. See p. 166, February 15 Era.

A young man in Chicago was advised to get some leeches for his swollen face. He bought and swallowed two. No ill effects.

The Dake Drug Co., cutters in Rochester, N. Y., is publishing piteous walls in the newspapers, soliciting the public's patronage.

GEORGE SPEARMAN.

Mr. Spearman, whose portrait is given above, stood highest in the rating of replies to Series No. 1 of the Examination Questions published in the Pharmaceutical Era in the issue of February 1. He came within one point of the total valuation put upon the questions, a result most satisfactory to the editor as well as to him.

Mr. Spearman is a native of Georgia, his birth occurring in Jasper County, July 29, 1868. He received his education in the Oak Grove High School at Social Circle, Ga., and in 1890 entered the employ of the retail drug firm of Gibbs & Spence, of that town, with whom he has since remained. The Georgia Board of Pharmacy granted him a pharmacist's license on May 2, 1892, he being one of the two who out of a class of eighteen, were successful in passing the examination. Mr. Spearman is a member of the Georgia Pharmaceutical Association and takes much interest in pharmaceutical matters generally. We congratulate him upon his good record thus far and wish him a continuation of like satisfactory progress.

A Chinaman wanted sarsaparilla root, and inquired of Druggist Cody, of Merced, Cal., for "Sises brother Ruth."

The Wyeth Chemical Co., Rochester, N. Y., will move into the new Moulson building, Lake avenue and White street. Geo. C. Rogers, for a number of years a clerk in Cleveland, has entered the employ of this house.

Hartz & Bahnsen Co., of Rock Island, Ill., are building up a large wholesale drug business. Their splendid new building is perfectly adapted to the needs of such an enterprise, and architecturally is a great credit to the city.

Irwin, Kirkland & Co., manufacturing pharmacists, Decatur, Ill., have recently added several salesmen to their traveling force and are making extensive improvements in their laboratory. They expect to increase their laboratory force and devote special attention to the manufacture and advertising of several of their remedies.

A MODEL DRUG STORE.

The Kulsh Pharmacy, Fourth avenue, corner of 23d st., New York, is large and commodious in its proportions, being entirely square, admitting of a symmetrical arrangement of the different departments that could not well be improved upon. The fixtures are of mahogany, from original designs made expressly for the purpose, and the designer has succeeded in combining both simplicity and elegance. They are entirely handwork, somewhat different in arrangement from the ordinary pharmacies, there being no shelf or drug bottles in the store proper, or the regulation drug drawers. These articles are relegated to the prescription or dispensing room, which is entirely separate from the store proper, although easy of access, being at one end of the store partitioned off by the fixtures, entrance being through a curtained doorway. The cases are of plate-glass, made to exhibit toilet articles and the specialties of the firm's make, which are quite numerous. Another unique feature is the absence of counters, with the exception of the soda counter. This brings the clerks in direct contact with the customers and enables them to move around freely and exhibit the goods in the different cases. The fixtures might be called one entire showcase, extending on all sides of the store. All the case doors are fitted with beveled plate-glass, the upper part of the fixtures being fitted with sliding doors, while the lower half has drop doors, the inside of the cases being finished with plush to show off the small articles and fine goods. Below these cases are large drawers to contain brushes and fancy articles. The fixtures are mounted with metal trimmings in gold relief, which brings out the fine quality of the woodwork to perfection. In the center of the store, built around a large pillar, which is enclosed in wood trimmings to match the fixtures, is a handsome cashier's desk, surmounted by a tastily designed brass railing; and the cashier, to grace this fairy cage, as it might be called, has been selected to harmonize with the rest of the beautiful surroundings. The soda counter is of four kinds of marble. The three silver fountains were built by Lippincott & Co., of Philadelphia, Pa., from original designs, and are, they claim, the handsomest of the kind ever made. The one on the center of the counter is the larger, and is surmounted by five electric lights, and the smaller two by three each. The soda water department is laid out for a large business, and is one of the most complete in the city. Back of the counter is a dumb-walter, running down to the syrup room in the basement, to carry up supplies to the fountain, syrup, ice, etc. In one corner of the store is the office, from which an entire view of the store can be had, the partition being of beveled plate-glass. The prescription department takes up about a third of the store, and contains a large window, which gives ample light. All the crude and powdered drugs, as well as chemicals, are in this department, and in cans, neatly painted, are used in place of the usual wooden drawers. The dispensing counter is on one side of this room, and is complete in all its details for a large prescription business. A large stock from all the leading makes has been laid in, and the store is fully equipped in all departments. A small room back of the dispensing room is used for putting the finishing touches on the

firm's specialties made in the laboratory. The night clerk has not been forgotten, and is unusually well provided for in a room partitioned off the dispensing room. The beautiful ceiling of the store is a work of art. It is done in oil and gold, and inlaid with twelve colors, with side walls to match. It is a representation of looped ribbons, with a narrow molding that is laid in colors, which give a beautiful effect when the store is lighted. The background is painted to represent a buff mat. The floor is of the latest pattern, mosaic tile. The gas fixtures are also of special design, and are for both gas and electric lights. The laboratory is situated in the basement, a large, light well-ventilated room, 50x75 feet, divided into three departments, a syrup-room, filled with steam-jacketed kettles and boiling pans, fruit crushers, etc., for the manufacture of soda syrups; a general manufacturing laboratory and a technical laboratory, where all kinds of analyses will be made for the public and the medical profession. The laboratories are in charge of Dr. Leo Eggers, Ph. D. and magister in pharmacy, of Vienna, and for some time a chemist in Tromsdorff's laboratory, Germany. Hot water is supplied to all parts of the store, a necessary requisition behind the soda fountain, as well as in the dispensing room. A large ice box has been built between the laboratory and syrup-room, and arranged so that a corner can be used by the chemist to keep cool such articles as he wishes, while the large part will be used for store purposes to keep fruit juices, syrups, cream, etc. Arranged by shelves is a department to keep ointments, cold creams and toilet preparations that are affected by heat. The store is in one of the best locations of the city, and will without doubt amply repay its proprietors for the liberal amount of money expended by them in its equipment. The Kulsh Pharmacy is incorporated, and is under the direct supervision of Mr. Oscar Kalish, the former manager of R. Hudnut's Pharmacy, Broadway.

PROGRESS OF THE INTER-STATE LEAGUE.

The league has made a wonderful progress within the past six months, and particularly since our last meeting in New York City in February. Associations have been formed in Norwich, Conn., Manchester, N. H., Portland, Me., Boston, Brocton, Cambridge, Somerville, Lynn, Salem, Lowell, and Worcester in the state, including the city of Worcester, Springfield, Pittsfield, Lawrence and Haverhill, all in Massachusetts. The members of the branches of the league on the east have formed a new society, the New England Druggists' Union, composed of the presidents, vice-presidents and secretaries of all the eastern branches of the league. The object of this union being to make a thorough and complete canvass of each county in each state, to organize county associations, to induce manufacturers to place their goods on sale subject to the league's contract plan. This committee is also to take charge of soliciting contributions of cash from such manufacturers, thereby taking advantage of such offers as have been made by R. V. Pierce, Fairchild Bros. & Foster, and others. To complete this work it requires capital, and this is the proper way to get at it, as the manufacturers have expressed their willingness to assist the work financially. Some of our league members were informed that a prominent New York City manufacturer that if the league would organize on a strict business principle, with a capital sufficient to amount of \$50,000, he would readily be done by the druggists organizing their respective counties. For in-

stance, 50 or 100 counties organize and each one endeavor to solicit subscriptions amounting to \$500 to \$1,000. We could readily raise the \$50,000 required, when all the counties of every county in named firms and many others which are friendly to the league, our association would be placed on such a basis as to carry out its objects in every county in the United States. These association committees could each agree to take charge of two or more counties, thereby hastening and making it more nearly complete. This plan is certainly a feasible one and Mr. A. O. Hull, of Central Falls, Rhode Island, president of the Mortar and Pestle Club, has taken the initiative in this plan, and has named the secretary that he has obtained donations of \$25 of each and every wholesaler in his locality, and other members of the league are reporting similar progress. The Boston association has taken up the same plan, and have promises of liberal donations, and the future of the league work in the country is bright. All the eastern branches have promised to be represented at our next annual meeting in May. The date and place for this meeting has not yet been decided, but the executive committee desires holding it at some point easily accessible, to have the largest representation the league has ever had. From the present outlook it can safely predict a good attendance. President Canning desires to see the northwest and south again wake up to former enthusiasm and adopt the work of the league. The new secretary has been distributing the organization blanks very thoroughly in the section allotted to himself, namely, the southern states. Mr. J. M. Eaton, of St. Louis, will cheerfully supply the west with any matters concerning the league, while President Canning has been doing the same in the north. I desire to impress upon every locality the importance of local associations, whether the cut rate evil exists in their locality or not. To make this grand league a success we must have every city, town and county in the states organized, and this can be done upon the same plan that our eastern friends are working on. If the druggists throughout the country will come to our assistance and help us carry on this great work, I will cheerfully supply any drugline with the best of the drugs necessary for organizing, and I trust they will not hesitate in calling on any of the league officers, who will willingly and their all very respectfully.

Very respectfully,

ROBERT J. FRICK,

Secretary I. R. D. L., Louisville, Ky.

South Carolina Board of Pharmacy met at Charleston, March 8, and of four candidates granted certificates to Royal Rouse, George H. Thompson and W. S. Prince, all of Charleston.

Connecticut Board of Pharmacy has licensed Daniel McCarty, A. H. Benhard, E. F. Richards, Croaby Pulling, S. M. Allen, J. T. Burns, J. P. Fitzpatrick, W. J. Galvin, T. B. Carney, J. B. Burgeois, Peter Morgan, B. L. Ueberfeld, Jr.

Iowa Board of Pharmacy.—The following are the successful ones at the March examination: John H. Rambo, Douds; C. W. Larson, Stanton; J. H. Power, Bloomfield; J. D. Jones, Carbon; C. W. Kent, Hampton; Miss Georgiana Knapp, Hull; W. S. Conklin, Des Moines; F. W. Cooke, Swadlow; Charles B. Atzen, Thor; A. J. Mettlin, Oswein; Frank H. Wunderlich, Dubuque; Mrs. F. M. Bunting, Rock Valley; James H. Miller, Eddyville; H. M. Salmon, Fort Madison; W. C. Smith, Marble Rock; C. M. Myers, Eagle Grove; Charles A. Little, Lamont; C. Marshall, Jr., Ackley; G. H. Carse, Pleasant Plaine; Charles A. Delander, Des Moines.

NEW YORK.

New York, March 24.—Another bill, this time of genuine interest to the retail druggist, has been introduced at Albany. It does not affect so many retailers as the bill given in the Era's last issue did patent medicine men, but it is quite as bad a bill just the same. By the courtesy of one of the solons the Era is enabled to print the bill in full. It is entitled "an act to amend the excise law in relation to druggists' licenses," and is as follows:

Sec. 1, subdivision 5, of sec. 19 of the excise law is hereby amended to read as follows and to take effect immediately:

A license to the keeper or keepers of a drug store permitting sales therein (only upon a physician's written prescription to be used but once) of strong or spirituous liquors, wines, ale or beer (not to be drunk on the licensed premises) in quantities of less than five gallons for medicinal, mechanical, artistic and sacramental purposes, which shall be known as a druggist's license and for which the fee shall be \$50. A druggist shall not be licensed under this sub-division unless he is a duly licensed pharmacist, and shall not be granted any other license under this act.

Sec. 2, chapter 402 of the laws of 1892 is hereby repealed.

The law now on the statute books provides that the fee shall be \$20, so this new measure adds \$30 to the tax. Mr. Nixon introduced the bill on March 15. The Era correspondent sent to him to find out the why and wherefore, and has received the pleasing answer that he only introduced the bill by request, that he knows it is a bad one, and that it will probably be killed in committee. Mr. Nixon is assured that he voices the sentiment of every retailer in this city.

The local druggists are all at sea anyhow on this matter of selling liquor legitimately and some of them say that they have got to stop selling it in any form, prescription or otherwise. The present tax for wholesale licenses is \$200, whereas last year it was only \$50, and the increase is so large that it doesn't pay to take out a license. The only thing a druggist can do now if he has an emergency call for brandy, for instance, is to send the applicant to a saloon or a grocery store if either is open at the time. But how about a call in the middle of the night, a by no means uncommon thing? He has either to refuse to sell the article or run his chances. With all the deference possible to those who denounce any suggestion that the druggists should have somebody at Albany to look out for their interests, it does seem as if that is the very thing needed. Somebody is all the time trying to put through bills affecting the drug business injuriously. Why shouldn't the other side protect itself? Is the query of one local pharmacist.

The election at the College of Pharmacy resulted about as was expected. The old college building, soon to be deserted, has seldom held as large a number of gentlemen on a like occasion, for there was a reason for the presence of as many as could be got out. There were six names before the meeting for trustees and only five could be elected. T. J. Macmahon's name, as told in the last issue of the Era, had been sent out on a separate slip after the rules governing the matter had been complied with, and Mr. Macmahon was elected. Mr. Osmun, whose name was on the regular ticket, was not. The result of the balloting was as follows:

Total number of votes cast, 90; president, Samuel W. Fairchild, 90; vice-presidents, Charles F. Chandler, 79; George Massey, 86; John R. Caswell, 89; treasurer, Horatio N. Fraser, 74; secretary, J. Niven Hegeman, 90; trustees to serve three years, Charles Rice, 90; Hermon W. Atwood, 88; Gustavus Rampsperger, 87; George B. Wray, 83; T. J. Macmahon, 63; Charles Osmun, 42. It was stated at the meeting that the new building will be occupied about the 5th of May. Just before adjournment Edward Kemp, of Lanman & Kemp, invited the gentlemen over to Delmonico's, where an elegant buffet lunch was served. President Fairchild made a very pleasant speech toasting Mr. Kemp, and the host responded in kind. Speeches were made by ex-President Ewen McIntyre, T. J. Macmahon and others. Both at the meeting and at Delmonico's the pleasant character of President Fairchild's administration was frequently commented on.

The trade recognized the bill introduced at Albany by Mr. Southworth, and which was given exclusively by the Era in the issue of March 15. It is this year's offspring of well known parentage and deserves nothing but death. In regard to this bill one manufacturer said: "This bill or one like it comes up every year, and everybody in the trade thinks it is nothing more or less than a strike. It is a very obnoxious measure, for it places in the hands of somebody clothed with a little brief authority the power of doing a great deal of harm. It is well known that in the hands of an incompetent man making an analysis almost any patent medicine or even so simple a thing as a quinine pill can be shown not to have in its composition just what the manufacturer claims it has. If the examiner wishes to bring out a certain fact in connection with the medicine under analysis he can easily do it. Any bill of this kind is dangerous and moreover it is an outrage to compel the patent medicine manufacturer to do what no other man is compelled to in the way ordered in the bill the Era printed."

There is a society in this city called the "Niederwald," four-fifths of the members of which are druggists. Victor Kostka, of the New York branch of the Interstate League, is president of the society. On the 7th of March the "Niederwald" gave a very enjoyable masquerade ball at Teutonia Hall on Third Avenue, and every man in the party was a druggist. There was no mention of "shop" at the ball, and not one of the masks gave any clue as to the business of the participants. About 100 persons were present. On Sunday this society will give an Easter festival at Teutonia Hall, in which the wives and children of the members will take part. It will be one of the old-fashioned affairs where everybody takes hold and helps to make everybody else enjoy himself.

The children will hunt eggs all over the hall, there will be a little performance by talent in the society, and an orchestra composed of members of the organization will make sweet and appropriate music. Among the members of this delightful little company are Messrs. J. Fleischer, R. Staebler, of Newark, F. A. Hatterman, and George T. Riefflin, of Sharp & Dohme.

The trade is talking about the great advance in cod liver oil, and the uncer-

tainty of prices and of the supply of new crop oil. Dealers do not yet know the amount that will be received. The same speculation exists regarding cocaine. Cocaine muriate is now held at \$5.90 an ounce, and manufacturers expect that much higher prices will prevail. The cause of the rise is the reduced supply of coca leaves and the diminished proportion of alkaloid these leaves contain. Menthol has been very high the last two or three months, selling lately at \$6 and over per pound. In view of the fact that large consignments of menthol are supposed to be near at hand, the price will probably drop soon.

The suicide of the Italian druggist, Francisco Priore, whose place of business was on James street, deserves more than a mere mention. He was for twenty years a soldier in the Italian army and his idea of honor was a high one. The story of his death shows that he inherited in no small degree the spirit of the old Romans. Priore's son, Lorenzo, had been arrested and placed in the Tombs prison on the charge of abducting a Brooklyn girl named Lizzie Hamilton. The arrest almost broke his father's heart and the subsequent worry and dark outlook for the young man made matters worse. Finally the druggist decided that he could not stand the disgrace that had been brought upon him by the son and took enough strychnine to kill a dozen men. Then he philosophically awaited his end. It was slow in coming, so slow, in fact, that the druggist expressed his astonishment. When the final struggle came he suffered stoically. Four physicians tried to save him, but in vain.

When his son learned that his father was dead and the reason for his suicide he also expressed his intention of killing himself. The young man is said to have been graduated from an excellent pharmaceutical college and to have borne a good reputation previous to this affair.

The games in the bowling tournament of the Wholesale Drug Trade Association since the two described in the last issue of the Era were very interesting, and attracted many of the boys from the various firms in the association, as well as a number of those who hope to become members when more teams are allowed to come in. There is no doubt that the success of this tournament in bringing the boys together has been phenomenal, when one considers how hard it is as a rule to get the drug clerks to meet. The employers have set a splendid example in this matter. Some of the heads of firms have bowled in the teams and others have attended the tourneys to encourage their boys. It is said that one employer who has not for years set foot in a saloon did so a few weeks ago simply because he wanted to show his clerks that he is interested in the sport. The games are held under Hohmann's saloon at present, but it is pretty certain that next year more suitable alleys will be selected. In the hurry of arranging the tournament this year the young men took what seemed the most central place for holding the games. The association is bound to grow, in fact there are now five drug houses who, it is said, want to have their teams enrolled. These are Corrant & Co., W. H. Schleffelin & Co., Tarrant & Co., Lanman & Kemp and E. Merck & Co. When the tournament is over it is intimated that the winners will either

be given a dinner or will have the value of the first prize doubled by the house they represent. The first prize is to represent the value of \$25.

The scores of the games on March 10 are as follows:

FIRST GAME.

C. G. Bacon & Co.	0	5	546

Moffatt's Pharmacy in the Astor House is being fixed up in first-class shape.

Dr. Charles Rice is about as good an example of a busy man as there is in this city.

L. E. Felndt, of South Orange, N. J., has moved into his new store, corner of Vose and South Orange avenues.

A. W. Sholes has established a pharmacy at 134 State street, New London. His manager is James L. Havens.

Daniel F. O'Connell, the pharmacist at 82 1/2 Broadway, will open another store at 55 Whitehall street, about May 20th.

G. B. Calman, the varnish manufacturer of Pearl street, has sailed with his family for Europe, taking the Genoa route.

John Pyne, formerly of Bellevue Hospital, is now in charge of Perry's Pharmacy, in the World building, at night.

A new member of the drug trade section of the Board of Trade of this city is the firm of C. F. Boehringer & Soehne, manufacturing chemists of 15 Cedar street.

The latest report received by a city firm about cichona bark sales in London showed that prices are much firmer.

The death of the senior member of the firm of Hayden & Kirk, of Jacksonville, Fla., was reported recently to McKesson & Robbins.

Mr. Loud, of Merck & Co., will soon be seen out on the road. Mr. Queney has arrived from St. Louis and has begun his work at Mr. Loud's old desk.

G. W. Chesbro, formerly with William H. McNair at Twenty-fourth street and Ninth avenue, has purchased the drug store at 623 Wythe avenue, Brooklyn.

That swindler who was so partial to plasters has not yet been captured. If he will only give the trade one more visit he will find himself received in proper style.

G. H. Somers, of Philadelphia, is said to be very sick at his home. Mr. Somers is well known in this city and is especially favored with friends in Jamaica, W. I., and the south.

Dr. A. M. Augsburgber, Lehn & Fink's representative in New Jersey, is down at Atlantic City for a couple of weeks to recuperate. He deserves to get all the benefit he desires.

The latest addition to the staff of Tarrant & Co. is M. C. McGrath. That assignment of brushes from Hines, Ltd., to Tarrant & Co., is now at the appraiser's warehouse.

William M. Townley, a well known druggist, died at Newark last week of pneumonia. He was the head of the Townley Drug Company and of the Paas Egg Dye Company, of Newark.

Among the other drug news from Florida received in this city this week was the sale of W. H. Evans & Co.'s store at Sanford to W. H. Mudge, and the assignment of George Hughes, of Jacksonville.

Dr. Lederle, assistant chemist of the Board of Health, has just returned from a trip to Europe in the interest of the city. Among other cities he visited London, Paris, Berlin, Vienna, Leipzig and Munich.

Dr. Hugo Kruse, of Peoria, Ill., an ex-druggist and well known in the western trade, has sailed for Rome by the Genoa route. He is to attend the International Medical Congress which is soon to hold its eleventh session in Rome.

W. N. Clark, of the firm of W. H. Schieffelin & Co., left New York for the Windward Islands on February 17 and returned on March 22. He visited St. Thomas, St. Kitts and Santa Cruz among other places, had a very pleasant time and returns in capital health.

The manager of the New York office of Ed. Pinaud reports that their business has increased over last year, which in the light of the present depression is worth congratulation. The firm's showing at the World's Fair has borne some fruit, results in Texas and the west being directly traceable to the exhibit.

Among the drug stores soon to be fitted with Low's Art Tile soda fountains by Howell & Sangston, New York agents of the company, are those of G. H. Corwin & Co., Greenport, N. Y.; E. S. Reed, Atlantic City, N. J.; A. D. Mallinson, Plainfield, N. J.; H. A. Faulkner & Son, Hoboken, N. J.; Corwin & Co., Shelter Island Heights, N. Y.; J. Taylor Clark, Bayonne, N. J.; and James Foulke, 107 Monticello avenue, Jersey City, N. J.

Hermann Weller, class of '87, N. Y. C. P., who has been clerking with J. P. Scherff, of Bloomfield, N. J., bought out the drug store of Charles L. Marshall, 99 Washington avenue, Newark, last week. Mr. Weller is an enterprising young man with many friends, who say he is just the kind of a man who will achieve success.

R. W. Walker, New York agent for J. W. Tufts, has put in new fountains at the drug stores of Louis H. Gaus, Albany, N. Y., and E. A. Sarot, Sag Harbor, N. Y., and has refitted fountains for A. G. Smith, Ellenville, N. Y., H. H. Howgate, Highland, N. Y.; C. R. Lush, Hempstead, N. Y., and C. C. Watkins, 2338 Third avenue, New York City.

Dr. John W. Burns, of Cuero, Texas, who is connected with the General Patent Medicine Depot for Western Texas, has been in this city attending the Polyclinic. He went home last week. Dr. Burns is well known in the south and has made many friends during his stay here. The General Patent Medicine Depot has offices at Victoria and Cuero, Texas.

R. W. Johnson, of Johnson & Johnson, William street, is back from a six-weeks' trip to Florida. Mr. Johnson had the best of fisherman's luck. During his stay four big tarpon were caught, of which number he only secured three. Still his friends think that was only a fair proportion for him. The largest of Mr. Johnson's catch was seven feet long and weighed 186 pounds.

The New York Quinine and Chemical Works will soon have its office on William street in better shape. What with the painters, the carpenters and the furniture men, the place will have a brighter look, and one more in keeping with the cheery countenances of the gentlemen in the office. Vice-president Cook will make the office more of a headquarters for the company's friends. If he has one-hundredth part of his friends call to see him, he will have to keep carpenters laying a new floor from the door to his desk most all the time.

NEW YORK COLLEGE OF PHARMACY.

Well, if the boys haven't had plenty of sport lately they'll eat their hats. The latest piece of fun had a very serious side, too, but all came well in the end. The story rather puts the laugh on the blue-coated preservers of law and order, though. Maxim Auerbach, aged 20, of 331 East Fifty-seventh street, Henry Fendler, aged 19, of 493 Lexington avenue, and Charles Prior, aged 21, of Middletown, N. Y., were arraigned in the Yorkville Police Court before Justice Koch on the morning of March 17, charged with disorderly conduct. The students had been taken into custody the previous evening while engaged in a display of fistic skill in Amthor's saloon, just opposite from the college. It seems that Police Capt. Gallagher, of the East Thirty-fifth street station, had been told that some students had arranged a "scrap" according to Queensberry rules, and he had sent Policeman Benham to investigate. The policeman in citizen's dress sauntered into the saloon with the hundred or more students and awaited developments. Presently a ring was formed and the two champions came forward and proceeded to business. There was a good deal of science shown and the contestants earned applause by their good display. In two

minutes time was called and an Benham was about to begin Policeman Benham, who had quietly slipped out, returned with several other men from the station and took the combatants, the referee and the proprietor off to the lockup. All four were placed under \$500 bail, which was furnished readily. In court the next morning the students denied the story about there being any rivalry between the contestants and said that the whole affair was merely a friendly bout such as is indulged in every once in a while at the same place. Justice Koch took the right view of the matter. He said that he believed in encouraging practice in the manly art so long as it was conducted within the provisions of the law. He did not see that a prize fight had been arranged or fought, and he discharged all concerned. Considerable praise should be given to one of the young gentlemen who took a certain responsibility in the matter, when it is said that another person was really the one interested. The affair has been the talk of the college, but the whole thing was gotten up in the spirit of fun, and there should be no thought that the boys did anything wrong or even sufficient to warrant the police in taking the principals to the station house.

The first batch of class pins have arrived and the boys think they are very fine.

Dr. Pellet took Dr. Chandler's place at the lecture on organic chemistry and pleased the boys immensely.

Dr. Rusby's synopsis for the summer class in botany is out. The class is open to pharmacists both in and out of college.

Quizmaster Ferguson has given the seniors an extra hour and a half quizzing, which is of great assistance. It is appreciated by all.

The seniors are hoping that the class picture will be taken in front of the new building and are working quietly to that end. It is said that they have a good chance to have their way.

Henry Kraemer takes the late Dr. Harrison's post as editor of the Alumni Journal. The boys all thought that the March number was a very excellent one.

"Volumetric solution" has been a source of worry to the boys, some of whom now admit that they do not know as much about the subject as they thought they did.

The seniors are arranging private "quizzes" in order to be better fitted for the coming examinations. The latter will begin on Monday, April 16, and will continue during the week.

Commencement exercises will occur on the 25th of April at the Carnegie Music Hall, instead of the 26th at the Metropolitan Opera House. It is understood that the return of the opera company to the big temple of song is the reason why that change had to be made.

One of the most interesting of lectures was that delivered on the 14th by Dr. H. H. Rusby on "Observations of a Pharmacognosist in London." This was one of the series of lectures held under the auspices of the Alumni Association and was illustrated by specimens. Among those who enjoyed the lecture and afterward discussed it was Alfred H. Mason, of Seabury & Johnson, who complimented Dr. Rusby on the accuracy and excellence of his paper.

BOSTON.

Boston, March 22.—It must have astonished the druggists in Western Massachusetts a short time ago when the Springfield Republican came out with a three-column article devoted to some of the peculiarities of the drug trade in Westfield. Had it been some other paper the matter might have passed almost unnoticed, but the standing of the Republican is so high and its influence so far-reaching that the statements seem to call for considerable study and reflection. The revelations are based on facts obtained from the books kept by the druggists in which to record their sales. No exaggeration, therefore, has been possible. Westfield, which furnishes the data, ranks high among New England towns in the possession of those qualities which make a model civilization possible. More than 7,000 pints of gin, whiskey, beer, etc., were sold by six druggists in Westfield in thirty-one days during the period immediately following the inauguration of local prohibition there last spring. That quantity represented over 5,500 separate sales, of which over 5,500 were classed as "medicinal." A simple arithmetical computation shows that at this rate more than 80,000 pints, or over 10,000 gallons of strong drink will have been sold by May 1. An examination of the law shows that it is responsible for this state of affairs to a certain extent; to how great an extent it would be difficult to decide. The blank certificate system has proved to be woefully inefficient, for no drinker seeking gin hesitates to record that his purchase is for "medicinal" purposes.

"It is evident," says the Republican, "that this abuse should be carefully looked into by the Legislature, and something done to stop a scandalous traffic. Advocates of prohibition should be concerned more than all others to prevent the business of the saloons from being transferred to the drug stores, because the no-license argument is greatly weakened unless the druggists can be kept within their legitimate sphere. Indeed, in the face of the showing which is made it should be no longer possible for the Legislature to tolerate the farce of a \$1 license fee for druggists. The confidence implied in the present law is being shamefully abused by a sufficient number of druggists to condemn the law and demand its amendment without delay."

Attention has lately been called to the operation of the no-license law in Hyde Park. Prohibition has been the rule in the town since 1882, but four druggists have licenses and some folks assert that it is as easy for a stranger to purchase a pint of whiskey as it is to secure the same quantity of benzine. The system is the same as in all the other towns of the commonwealth. The druggists are placed on honor and are governed only by the law that sales of liquor by druggists shall be made only upon the certificate of the purchaser, which certificate shall state the use for which the same is wanted. A book shall be kept by every druggist, in which he shall enter every such sale. No sales can legally be made on Sunday. A druggist for violating the act may be prosecuted or punished, but it has never been known in Hyde Park, as no convictions have ever been secured. The authorities place full faith in their honor,

and such a thing as an investigation is not on record in the eleven years of a no-license system. One selectman says that all the druggists are honorable gentlemen and that the board is satisfied with the way in which the business is conducted. The chief of police states that the liquor sales among the druggists are conducted within the law. He has no idea of the average yearly sales in the town, but imagines they are less than in any other town in the state of proportionate population. One of the druggists states that if two others will give a statement of their annual sales he will, too, otherwise he will not. Meanwhile the gossips in the town continue their guesses and insinuations about the state of the trade in the town.

There is now before the Legislature a bill introduced by Senator Cronan relating to the analysis of all patent and proprietary medicines. In this proposed law it is provided that the owner of a patent or proprietary medicine, which is to be sold or offered for sale, shall furnish the State Board of Health with the formula used in the preparation. It will be analyzed by the board from time to time, and if the ingredients used in the preparation are found to be injurious to health the board will notify the owners of the medicine, and advertise the name of the preparation and the result of the analysis in the newspapers. The formulas furnished to the state will not be accessible to the public.

Sentence was imposed in a case of alleged violation of the liquor law one day this month at Lawrence, from which an appeal was taken, and it is possible that before the case is finished it will bring about a ruling as to the amount of liquor a druggist may legally have in his possession. The defendant was Simon Viger, a member of the firm of Belleville, Viger & Co., who conduct drug stores on Franklin and Hampshire streets, Lawrence. Dr. O. T. Howe, a witness for the prosecution, said that to the best of his knowledge it was a rare thing for a physician to write a prescription containing brandy, whiskey or gin. Dr. Victor Mignault, who was called for the defense, said that whiskey was used sometimes in diphtheria cases as an ingredient of medicine. Brandy was used in medicines in typhoid fever and pneumonia cases, and gin was used in connection with dropsy and stomach troubles. The court found Viger guilty, and imposed a fine of \$100 or three months; and it is from this decision that appeal is taken.

A decree of interest to wholesale and retail druggists and manufacturers of chemicals has just been given in the case of Kerry et al. vs. Toupin, in the United States Circuit Court for the District of Massachusetts, Judge Aldrich having approved a decree for perpetual injunction and for reference to C. F. Searle, as master, for an accounting in accordance with an opinion filed March 1. The complainants, who are the leading manufacturing chemists in Canada, contend that their trade name, "Syrup of Red Spruce Gum," was not only a trade name entitled to protection under the International Convention for the Protection of Industrial Property, but also amounted to a trade mark at common law. The law of England and America has been that descriptive words were public property, and the courts have hitherto refused protection

to such names as "Iron Bitters," "Acid Phosphate," and a large number of seemingly descriptive trade names, notwithstanding the fact that the original users of such names have frequently expended thousands of dollars in advertising their products, and that their competitors have sprung up after the products have become popularized at the expense of the originators of the names. A famous authority on the trade mark question once declared that the deduction from the English and American cases was that the courts would not permit a man to "commit a fraud except by the use of a descriptive name." The case of Kerry vs. Toupin is the first case ever finally decided in which the international convention has been involved, and the meaning of the words "commercial name" or "non-commercial," as used in the treaty, defined. Judge Aldrich decrees that the defendant has infringed upon Kerry, Watson & Co.'s rights in their trade name, "Syrup of Red Spruce Gum," under the international convention and also upon the complainants' trade mark rights in that name, and has ordered an injunction to issue perpetually restraining the defendant from dealing in an artificial medicinal preparation under the name of "Syrup of Red Spruce Gum," or any translation thereof. The convention being in the French language, and in the nature of an international treaty, involved an extended consideration of the civil law of France, by the light of which the terms of the convention are interpreted. In this case it appeared that the complainants had expended over \$100,000 in advertising, and the question was whether their competitors would be allowed to break in upon the complainants' business by selling a similar mixture under the name adopted by the complainants. The highest courts in Canada had refused relief to the complainants, and the result of this contest in the United States courts has been watched by druggists and manufacturers of chemical preparations with much interest.

The Essex pharmacy in Holyoke has been sold by Cunningham & Koegel to J. J. O'Flaherty. He has been in the drug trade in the city since 1888, when he entered the employ of J. J. Nugent.

The police of Brockton jailed the drug stores of William Donkin and J. E. O'Connor. They secured about twenty gallons of liquor at Donkin's and a small quantity at O'Connor's.

Down in Cohasset, a town on the rocky coast just south of Boston, the selectmen appear to be running affairs pretty much to suit themselves, without regard to the other citizens. Here the town has voted in favor of liquor licenses, 95 to 58, yet the chairman of the selectmen autocritically says that if the single druggist there applies for a license it will be refused, and he adds: "He held a license in 1890, and we believed its privileges were abused. At all events there was liquor drinking here that cost us something, and all we received from him was a \$1 license fee. He has made an application each year since then, but it has always been refused. Those who want it for medicinal or mechanical purposes can get it right here in Cohasset. It matters very little what purpose one wants it for if they know where to go. There is plenty of it in town." And this is what the town clerk has to say on the subject: "We have had all the experience

we want in trying to convict illegal rum-sellers. The 'yes' vote this year will not change conditions in the least. It is a pretty sure thing that our druggist will apply for a license, but he will be refused. There will be no permit to sell liquor granted in Cohasset this year at least."

There are rumors afloat in Malden which indicate that there may be considerable uncertainty about the granting of liquor licenses to druggists the coming year. The matter will come before the aldermen soon, and it is known that several of the members of the board are opposed to granting any licenses to local druggists. At the recent meeting of the Malden Prohibition Club a resolution was passed calling on the Mayor and aldermen to stop the granting of sixth-class licenses. If the board departs from the views of the boards of the last few years, there must be heroic action, and it is doubtful if this may be expected from the present aldermen. The local druggists' association is holding frequent meetings, and although the members have voted not to allow any of the business of the organization to be published in the local papers, it is well known that a schedule of prices has been adopted, and that the members have pledged themselves to sell only at these prices.

A communication has been received by the Lowell City Council from the State Board of Pharmacy, complaining that a registered pharmacist is not always to be found at the drug store of Thomas F. Hoban, in Melville. A notice has been sent to Mr. Hoban that his liquor license will be forfeited if he does not comply with the law.

According to the latest bulletin issued by the State Board of Health, only six of the thirty drugs inspected during January were found to be adulterated or varying from the legal standard. The samples of drugs found to be adulterated were chloroform, solution of magnesium citrate and syrup.

By a vote of the town of Avon, the selectmen are to grant no liquor licenses to druggists.

A blaze in a drug store in Holyoke, kept by A. F. Lyonaize, recently caused a small loss.

P. T. Noyes, manufacturing druggist at Lancaster, N. H., is to remove his establishment to Nashua, N. H.

C. C. Bingham, a prominent druggist in St. Johnsbury, Vt., has been elected vice-president of the Y. M. C. A.

H. C. Hall, a druggist in Waltham, was swindled out of ten dollars last Monday by a man about 39 years of age, who used a worthless check.

George L. Dearborn, a druggist, was a sufferer by the extensive fire at Newmarket, N. H., on March 11, though his loss was caused chiefly by water.

An incendiary has been at work in Waltham, and one of the places which he tried to destroy was the drug store of H. E. Fleming, corner of Moody and Spruce streets.

At a meeting for organization of the Bagley Dandelion Compound Co., at St. Johnsbury, Vt., officers were elected as follows: President, C. D. Bagley; vice-president, Dr. T. R. Stiles; clerk, J. E. Gage; treasurer, H. A. Stanley.

A report has been presented in the Massachusetts Senate to the effect that the bill to limit and regulate the sale of

intoxicating liquor by druggists and apothecaries for medicinal, chemical and mechanical purposes, ought not to pass.

At the last meeting of the Boston Scientific Society, Prof. George F. H. Markoe presented a paper entitled "Nitric Acid and the Nitrates," which was similar in its nature to the papers read by this gentleman at previous meetings.

Temperance folk in Marblehead intend to petition the selectmen that, when the time comes for granting druggists' licenses, a public meeting be called, that the people may vote on the question. But some think that this will be unnecessary, as a majority of the selectmen elected were decidedly opposed to the granting of druggists' licenses.

At sessions of the Board of Registration in Pharmacy, held March 6, 7 and 8, forty-six candidates were examined and the following named were granted certificates: C. E. Alonzo Cameron, of Springfield; Albert W. Thomas, of Boston; Leon C. Ellis, of Lynn; Henry E. Bannister, of Boston; Benjamin F. Myer, of Boston; James A. Beane, of Boston; Fred E. Jones, of Lowell; Benjamin R. Day, of Boston; Thomas F. Carey, of Woburn; Alexander W. Cunningham, of Boston, Fred C. Beane, of Boston.

The anti-cigarette people have had another inning before the committee on public health at the State House. Representative Teamoh, who introduced a bill prohibiting the manufacture and sale of cigarettes and cigarette tobacco, spoke strongly in favor of the bill, and impressed on the committeemen the "great harm" which is done to the public health by the use of the article which he seeks to prohibit. There is a law now which prevents the sale of cigarettes to minors, said he, and the druggists and other dealers are obeying the law. It is extremely improbable that the Legislature will pass such a bill as that proposed.

Druggists have been heavy losers by fire in the last few weeks. At Gloucester, on March 17, F. A. Barker's store was damaged to the extent of several thousand dollars. Fortunately he was insured. A few days previous a fire was discovered about 2 o'clock in the morning in the drug store corner of Prospect and Park streets, Gloucester, occupied by A. P. Parkhurst. The rear of the store was thoroughly gutted and the roof partially burned. The damage to Parkhurst's stock was \$600. In this city a few days ago, there was a fire at No. 335 Columbus avenue. The lower floor, corner of Dartmouth street, is occupied by William J. Conklin, who has recently purchased the drug store formerly owned by Charles Captain & Co., and who also leases the entire building. The fire in its upward progress caused a damage to the fancy fixtures of the store to the extent of from \$1,000 to \$1,500. The fourth and fifth floors are occupied by Mr. Conklin, and his costly furniture is damaged to the extent of fully \$1,500. Mr. Conklin's loss on both the drug store and his apartments above is fully covered by insurance. An explosion of naphtha recently caused a slight fire in the drug store of H. Cobley, 45 Hancock street, Dorchester. At 134 Milk street, in a building occupied by A. Klipstein & Co., dealer in aniline dyes, a blaze caused a damage of about \$150, and at Springfield, the building of the Hecla Chemical Company, on Hickory street, was burned to the ground, with a loss of about \$500.

PHILADELPHIA.

Philadelphia, March 22.—Since the last letter to the Era the business outlook in this city has undergone somewhat of a change for the better. There were a few exceptions taken to the article published in the March 15th Era, in which it was stated that the drug trade in this city was dull. A few said it was not the case with them, and intimated that the dullness was confined to the retailers. Notwithstanding this, the largest houses in this city have repeatedly said since the latter part of February that the trade, which picked up just before Christmas, was beginning to fall off, and so that if something for the better did not soon take place there is no telling what would happen.

From a number of the best informed wholesale druggists it is learned that the prospect of better business is more encouraging, and it is hoped that there will be no cessation of orders for some time. Some of the establishments that were compelled to reduce their forces are now taking back their old hands, and in many cases overwork is required to get the orders out on time, and even with this extra work they cannot keep pace with the demand.

"When thieves fall out honest men get their due." This is applicable at the present time to the trouble that the Distilling & Cattle-feeding Company is having with its adherents and henchmen. For some time there has been considerable trouble existing between this company and the American Distributing Company, both of which were working hand in hand with each other against the consumer. It appears that the American Distributing Company is sick of its arrangements with the whiskey trust, and threatens to withdraw and start up distilleries of its own. It was said that a few days ago a settlement had been reached, and that the two companies would work together again, but since then the angel of peace has departed and an imp of darkness is pointing out the path for these blind companies. The distributing company is not satisfied with the profits the whiskey trust is said to be making, it claiming that all the business is on one side, and that side belongs to the trust. The distributing company also claims that the trust has not managed its business from a business point of view as well as it has from the speculative side.

It is generally supposed that the cut-rate druggist sells all his patent medicines and a number of other articles at a price considerably below that charged by the regular druggist. This is not always the case, and if the public in general had their attention called to the high prices these cut-rate people ask, it would do the regular druggist much good and lessen the profits of the man who claims to sell everything below that of the regular druggist. One of the largest cut-rate houses in this city advertised to sell Casara Sagrada at thirty-five cents an ounce and \$3.50 a pound, while the regular druggist sold this same article at ten cents an ounce, or \$1.25 a pound, and was satisfied to get this price, as there was a good profit in it for him.

French, Cave & Co. are very busy in their pharmaceutical department, they having to work overtime to keep up with their orders.

William McCorkle succeeds Dr. Palmer at Twelfth and Somerset streets.

J. H. Kirk has established himself in a handsome pharmacy at Chester, Pa.

Charles P. McDonnell has opened a new drug store at 1693 South Tenth street. Camm's Pharmacy at Norristown, Pa., has been purchased by W. H. Campbell, P. C. P., '88.

Dr. C. H. Bahl, formerly at 528 Master street, has opened a new pharmacy at Nineteenth and York streets.

C. F. Cartwright, formerly of Twelfth and Jefferson streets, has bought a store at Moore's, Delaware Co., Pa.

George W. Davls, a well known drug clerk of this city, has purchased T. D. Lewis' pharmacy in Scranton, Pa.

Robert W. Maris, of Tenth and Spruce streets has bought the store at Twenty-fourth and Thompson, formerly owned by W. A. Smith.

M. N. Kline, of Smith, Kline & French Co., has just returned from a trip to Washington and Old Point Comfort. He went away for a short rest.

Mr. Emerson, of the Emerson Drug Co., Baltimore, Md., has gone to London for the purpose of establishing the sale of "Bromo-Seltzer" in England.

William R. Warner, senior member of the firm of William R. Warner & Co., is in Rome attending the meeting of the International Medical Congress.

Shoemaker & Busch are making a fine display of chamolis skins and sponges. They have given up a room for this exhibition on the second floor of 604 Arch street.

Dr. B. L. Brown, who has the drug store at Tenth and Arch streets, has greatly improved the corner. He formerly kept the store at Seventh and Arch streets.

Mr. Simpson has purchased his partner's interest in the business at Broad and Parish streets. Mr. Kilgus will represent Hance Bros. & White in adjacent territory.

James Milligan, who was for many years a salesman for John T. Lewis & Bro. Co., lead manufacturers, of this city, died on March 9. Mr. Milligan was a well known man in the drug trade.

The new drug store under the Pennsylvania Railroad depot for Dr. Watts is rapidly approaching completion, and by the 1st of April it will be ready for occupancy. Bangs, of Boston, is fitting it up.

Farberweke, Vormals Meister, Lucius and Eruning, of Germany, have brought suit in equity in the United States District Court of this city against John Wyeth & Bro. and Rosengarten & Sons, asking to have the defendants enjoined from the manufacture of basic bismuth gallate, alleged to be an infringement on a patented invention.

Andrew C. Hewitt has purchased the pharmacy of Charles Oram & Co., 392½ Germantown avenue, in which he was previously a silent partner. Mr. Hewitt has for several years been one of the successful salesmen representing Hance Bros. & White. He will continue to supply Philadelphia druggists with fruit juices, his store being in charge of a graduate of the College of Pharmacy.

Wine of colchicum root has claimed another victim through carelessness. John Collins, a young drug clerk who lived in West Philadelphia, feeling unwell one day last week, went into the cellar of the

drug store of Charles J. Hiddle, at 3248 Market street, where he was employed, and drank, as he thought, some port wine. Then he became very ill and went home soon afterwards beginning to vomit and purge. When the doctor called the next day he found no improvement in Collins. At the drug store it was learned, upon investigation, that he had drank six ounces of Wine of Colchicum Root instead of port wine. Collins died the same day, and the case was reported to the coroner.

The Drug Exchange, of this city, is about the first organization of its kind that protests against any legislation which affects the drug trade. When the Padlock pure food bill was introduced in Congress it was mainly through the push and energy of this exchange that the bill never became a law. Now there is another bill similar to the Padlock bill, which is in the hands of one of the committees of Congress. This bill was introduced in the House by Congressman Hatch, and it is similar to the Padlock bill in many respects. The Drug Exchange has its eye on this bill, and several meetings of the legislative committee have been held to devise measures to secure its defeat if it should prove objectionable. The matter is now being investigated, and in a short time some action will be taken.

The pharmaceutical meeting at the college, which took place on March 27, had a programme of much practical and scientific interest. F. W. Haussman read a paper on the "Presence of Lead in Citrates;" M. F. Schaape, on "Examination of Commercial Preparations of Phosphate of Iron and Alkaloids;" Joseph Crawford, "A Few Uncommon Vegetable Fibers;" Harold C. Barker, "An Analysis of Pycnanthemum Linifolium;" John Culey, "An Analysis of Sanguinaria Seed." Prof. Trimble was chairman of the committee of arrangements.

The junior class had its annual struggle last month, and now examinations are but memories. The questions propounded and answered—in some instances—were rather difficult.

The annual meeting of the members of the college was held on March 26, and the business of most importance transacted was the election of an editor for the American Journal of Pharmacy, which position has not been permanently filled since the death of Prof. Maisch. Prof. Henry G. Trimble was chosen as editor. The selection is considered an excellent one by the faculty and old men, who are greatly pleased that such an able man was secured. Prof. Trimble accepted the position only after much solicitation, and never was a candidate in the sense of seeking the editorship. With Prof. Trimble in charge of the Journal, its future success is assured. As trustees to fill the vacancies caused by the death of Prof. Maisch and the election of Mr. Shinn to the treasurer-ship of the college Messrs. Bastin and Procter were chosen. Messrs. Pitt and Stem were re-elected.

A cargo consisting of 313,500 gallons of brandy, 200 barrels of red wine, and 105 barrels of port wine, was recently dispatched from San Francisco to Germany. It is said that 400 barrels of the brandy were intended for use in the German army hospitals.

CHICAGO.

Chicago, March 22.—As the spring with all its brightness dawns once more we feel enthused to think the more than cruel winter to some sad hearts, with its biting poverty and distress has passed into history, and may the Easter bells ring in new hope, as much in the business world as in the home.

Sharp & Dohme have a new representative in the city.

The Paris green combination has not as yet issued their schedule of prices.

J. E. Griffin, Chicago, and western manager of Kahle's Bacilline, reports good sales.

Dr. A. E. EBert has bought a number of chemical specimens from the World's Fair sale.

Mrs. William Bod-man, on March 14th left for a California trip with a number of lady friends.

The salesmen of Morrissou, Plummer & Co. report a fair increase in business over last month.

Elkin Drug Company succeeds Elkin & Matkins Drug Company, corner Van Buren and State streets.

A. V. Lane, of Twelfth street and Wash-ash avenue, has decorated his store with a new set of awnings.

Louis Jungk, Fifty-first street and South Ashland avenue, has been in ill health for the last few days.

Dr. F. M. Trask, proprietor of the International Pharmacy, reports business quite dull in his neighborhood.

The druggists were busy on St. Patrick's night and possibly the following day, the result of the large parade.

Eckley & Roszell are now running a branch store—formerly owned by Mr. Flander—at Norwood Park.

Hurst's Pharmacy, at Morgan Park, is now managed by Arthur Cook, who formerly represented Heinemann & Co.

Buck & Rayner are canvassing the city trade for the sale of goods and new perfumes of their own manufacture.

V. H. Dumbek, of Hurst's pharmacies, seems to be busily engaged preparing for the soda season at the different stores.

"Al." Hunt, of Fuller & Fuller Company, reports an increase in number of orders, but quantities fall short of last year.

O. F. Alex, of Sixty-third street, has stored his stock and fixtures for the present, having taken a position in some other store.

B. M. Johnstone, of Park Manor, has succeeded W. R. Westgate, who was obliged to step out on account of ill health.

C. L. Lindemann, of Fifty-first and Wentworth avenue, has secured a renewal of his lease for five years, at a slight advance.

Robert Leonard, druggist, of South Chicago, Superior and Eighty-fifth streets, was a candidate for Alderman in the Thirty-fourth ward.

Harry Graft, of T. N. Jamieson's "Bamboo" store, is about to take a month's vacation out west. Ralph Coupler fills the vacancy.

T. N. Jamieson's World's Fair store, corner Sixteenth and Eggerton avenue, opposite the "Midway Plaisance," has at last closed its doors for good.

H. J. M. Schroeter, of 425 State street, opposite Polk, has secured a lease for an upstairs room in a new prominent

down-town corner building, where he will carry on a prescription pharmacy.

Mr. Gallbreth, of Robert Stevenson & Co., who unfortunately broke his leg some weeks ago, is improving as well as could be expected.

J. G. Flint, of George A. Graves & Co., Thirty-fifth and South Park avenue, has returned to his post of duty, after a month's vacation at home.

J. A. Burger, 423 South Ashland avenue, offers the last one of his young pointers for sale. They were on exhibition at the last canine show.

Dr. Titzel of One Hundredth street pharmacy, east side of South Chicago, is now a full registered pharmacist, having passed a successful examination.

Messrs. Robertson and Schultz, old employees of Dale & Sempill, are no longer on the corner of Clark and Madison. The public will miss their familiar faces.

Mr. Lincoln, of Lord Owen & Co., has been quite busy introducing a successor to Mr. Chandler, in the stock yards and Englewood district, to represent the firm.

Wrisley's new soap, "I'm all right," seems to have a drawing card. Mr. Wrisley was one of the fortunate ones who obtained a rebate from the gas company.

Walter H. Krouskop, owner of two stores, Thirty-seventh and State, and Wentworth, reports an increase in business in his neighborhood in the last month.

F. W. Hurlburt succeeds Mr. Brashires, of Morrissou, Plummer & Co. Mr. Hurlburt was formerly in the retail business, at Oakland boulevard and Cottage Grove avenue.

Theo Windholt is about to open a new store on West North avenue, in his building near Humboldt Park. This makes the third drug store Mr. Windholt has in his own buildings.

A. B. Charbonnel, northeast corner Thirty-first and Cottage Grove avenue, was at his business as usual Saturday, March 17, and was found dead in bed Sunday morning, from heart disease.

John Carnele, Michigan avenue and Sixteenth street, is away on a trip for his health in California. Mr. Carnele was formerly manager of E. H. Sargent & Co.'s retail department at 125 State street.

E. C. Riebel, of Forty-third and Wallace streets, experienced the loss of an unopened pound bottle of extract of crab apple blossom. Some one with a liking for perfume, appropriated it from the top of the show case.

J. J. Magee, of South Park, near the south entrance of the World's Fair grounds, is anxiously looking forward to warm weather, so as to cool the "weary and thirsty" who will probably visit the remains of the white city.

Joe Kearney, proprietor of Stearns' Electric Paste, has been busy with a law suit in reference to this article, with his former partner, Mr. Cremaux, for placing a similar article on the market. The result has not yet been ascertained.

Prof. N. Gray Bartlett, corner Twenty-second and Indiana avenue, is about to vacate his old corner, on account of the building being torn down. He has secured a room, but is still looking farther, for better advantages, if possible.

Mr. Schulte, formerly of the Meyer Bros. Drug Co., of Kansas City, has been in this city the past week visiting his son, of Fifty-fifth street and Jefferson

avenue, Hyde Park. Mr. Schulte has also just returned from a trip abroad.

John Dietz, druggist, Forty-fifth and State street, was one of the selected delegates to the primary of the Thirty-second ward, in behalf of the Republican nominee, Joel Longenecker, alderman of his district. Ald. J. R. Mann won by a big majority.

Dr. Hall, of Sixty-ninth and Paulina streets, has finished his new corner store front building, after considerable trouble, as the time of the contractors to have finished had expired and he was obliged to take the work out of their hands and supervise the completion himself.

Peter Van Schaack & Sons are busily engaged in the new issue of their "Price Current," which will soon go to press. Adolph Hoffman, for the last three years head of their country department, but formerly with Meyer Brothers Drug Co., St. Louis, says he is suffering from gout.

A collision occurred in front of the pharmacy of J. & W. E. Holland, corner Madison avenue and Fifty-fifth street, Hyde Park, a few mornings ago. An empty carriage standing in front of the store was run into and smashed by a runaway team, entangling the three horses and taking the policemen considerable time to unravel the heap. Fortunately no one was injured.

Otto Coltzan and family, corner Twenty-second street and Archer avenue, have returned from their western trip, much benefited, and having remained much longer than they originally intended. Mr. Coltzan is the owner of the Triangler Pharmacy and has been outbidden on the lease of his store by a former clerk, and in consequence will remove to the opposite side of the street.

The building on the corner of Fifty-fifth street and Lexington avenue, Hyde Park, used by the Chicago University for chemistry, was vacated recently, as the Kent Chemical Laboratory has been completed, and on Thursday evening, March 8th, was the scene of the first oratorical contest of the University of Chicago, to send delegates to the contest in Wisconsin in May. First and second prizes of \$5 and \$15, were awarded by Alexander H. Revell & Company.

Mr. Weck, of Austin, Ill., formerly with Oberman, of the north side, is now connected with Conrad & Co.'s new store in Kenwood, corner Forty-seventh and Lake avenue, which is expected soon to be opened. The floor of the store will be of marble mosaic. The soda apparatus is Lippincott's, and fine hardwood fixtures match the rest of the store. The store will certainly be in accord with its surroundings, as Kenwood is one of the most aristocratic localities of Chicago.

E. B. Macy's, Ewing avenue, South Chicago, was the scene of a dreadful catastrophe the other morning. From the doctor's office over his store ran a private telephone wire to his residence, and during the night this broke and rested on the trolley wire of the electric car line. It became charged, and, as it hung toward the ground, a dairyman's horse going by struck it and was instantly killed. The driver, getting down, struck the charged earth and received a severe shock, as did others, who with nippers and gloves were trying to get it down. Mr. Macy at last got the wire free. The horse literally had his life burned out of him.

DETROIT.

Detroit, March 24.—At last, the retail druggists have awakened to some of the enjoyments of this life and propose to have a banquet. All hands will be invited, but just when the event will occur has not yet been definitely decided upon. It will, however, occur in the very near future, if the efforts of the committee appointed by the retailers at their last meeting count for anything. There is nothing so productive of good fellowship, sociability and friendship as an entertainment of this kind.

Druggist F. W. R. Perry has recently received a number of letters from different parties out in the state informing him that one "Chas. Arnold," a canvasser, has taken orders from them and others in their vicinity, for a polishing iron and a recipe for a polishing compound, the latter being written upon his prescription blanks. The agent's scheme is to deliver the recipe upon the payment of \$2, with a promise to deliver the polishing iron in a few days, which, however, he fails to do. Mr. Perry says he never heard of the fellow and wonders how he got hold of his prescription blanks. He thinks he is a fraud.

George W. Wilner has purchased the drug store of C. B. Fuqua, Big Rapids.

Tibbs' drug store has been moved from 133 Monroe street, to 618 South Division street, Grand Rapids.

Waldron & Todd, druggists, Jackson, are having a part of the Hurd House fixed up for new quarters.

Nelson, Baker & Co. are building a two-story addition to their laboratory, to be used as a pill department.

Cornelius DeFree, formerly prescription clerk for George McDonald, Kalamazoo, has opened a new drug store at Holland.

P. S. Gould, a resident of Climax, is said to be the possessor of an iron mortar and pestle brought to America in the Mayflower.

The newspapers say a company capitalized at \$50,000, with \$35,000 paid in, has been organized to run a wholesale drug house at Manistee.

Burglars entered the drug store of Henry Haigh, 264 Jefferson avenue, recently, and purloined \$18 worth of cigars. It is thought boys did the job.

Burglars entered the drug store of Conrad Bros., Otsego, March 8th, securing some currency and a considerable quantity of perfumery and cigars.

W. A. Rudell and S. Zeller have purchased an interest in the drug store of V. R. Conway, Sault Ste. Marie. The firm will do business as Conway & Co.

John D. Muir and Albert Stonehouse, formerly with G. T. Haan & Co., Grand Rapids, have purchased the drug store of Scribner & Aldworth, located in that city.

M. L. Campbell now represents the Hazeltine & Perkins Drug Co., Grand Rapids, in Northern Michigan. Mr. Campbell was formerly engaged in the drug business at Leslie.

The Hupp & Pierce Pharmaceutical Company, of this city, is the name of a new manufacturing concern which recently filed articles of association. It has a capital stock of \$20,000, with \$2,000 paid in.

A can of ammonia in a freight car standing at Sarnia exploded recently with a terrific report and entirely destroyed a

carload of miscellaneous freight. The loss to the railroad company will amount to several hundred dollars.

W. H. Allen, Ph. C., lecturer in charge of the chemical laboratory, Department of Pharmacy, Detroit College of Medicine, has assumed charge of Farrand, Williams & Clark's new laboratory. Mr. Allen has had extensive experience in laboratory work both in this country and abroad.

C. C. Sherrard, lecturer on pharmacy in the Detroit College of Pharmacy, and chemist for F. Stearns & Co., met with a serious accident recently. In attempting to "make" the street car for home he was knocked over by a bicycle rider, sustaining a broken rib as the result of the collision.

Gustav Hentschel, a clerk in the employ of Thum Brothers & Schmidt, druggists, Grand Rapids, died recently from the poisonous effects, it is supposed, of overdoses of arsenic, iron and strychnine tablets which he had been taking for a tonic. He was 18 years of age, a Bohemian by birth and highly educated.

Chicanori Tomihira, a Japanese employed in F. Stearns & Co.'s laboratory, committed suicide March 2 by taking strychnine. Frederick Stearns brought Tomihira to this country about three years ago, and with the exception of a short time spent at Ann Arbor, he has been employed at the laboratory ever since. The dead man's father was a prominent army official when Mr. Stearns went to Japan and he carried a letter of introduction to him. Young Tomihira thus heard much of this country and expressed a desire to come here. He was very effeminate and was more like a girl than a boy. Mr. Stearns thinks there is no doubt but that the young man committed suicide, as the Japanese think suicide a noble death.

ST. LOUIS.

St. Louis, March 22.—There has been a general revival in country trade in the past two weeks. Some of the wholesale houses report a very gratifying improvement in trade, while others state that they are receiving a sufficiently large increase in orders to warrant the belief that there is a general renewal of trade confidences, and that the depression which held back the volume of business usually expected at the new year has about exhausted itself. The city retail trade continues fair, but there is not yet manifest the buoyancy which retailers would like to see. The slight revival in trade since February 1 is not sufficiently encouraging to invite visions of wealth. The cutter is still in the field, but there are those that entertain the opinion that his days are numbered, and chief among them is President Thomas Layton, of the St. Louis Apothecaries' Association, who thinks a gleam of light once more appears on the horizon.

The Inter-state Retail Druggists' League is still his pet idol, and, to use his own words, "It is the only organization, national in its character, ever started, having for its object the care of the financial interests of the retail druggists."

"The fields are full of associations for scientific pursuits," he says, "but we have but one Inter-state Retail Druggists' League."

Mr. Layton, in speaking on this subject, expresses his appreciation of the great aid extended to him while he was

President of the League by the pharmaceutical press.

John S. Mollitt was quite ill for several days at his family residence at Webster Groves.

David Kunkel is now with Adam Itothe, at 550 Olive street. He only recently returned to the city, having been at his old home in Ohio.

Alfred Grunfeld, of Grunfeld Bros., druggists at Albuquerque, N. M., was calling on the St. Louis trade a few days ago.

The St. Louis College of Pharmacy will hold its examinations on March 27 and the graduating exercises on April 19. The class will number about fifty.

The Lathordine Chemical Company of St. Louis has been organized with a capital of \$3,000, by Henry Toohy, S. P. Hartman, Homer Day, and others.

Dr. Muenich, who was with Meyer Bros. for many years, is now with the J. S. Merrell Drug Company. He is one of the best posted salesmen in St. Louis in handling the city trade.

Mayor C. P. Walbridge took his wife to Hot Springs a few days ago to improve her health. His honor will remain with her for three or four weeks in order to get a rest from his arduous duties.

The St. Louis Drug, Oil and Paint Association held its regular meeting and informal banquet at the Mercantile Club on Thursday night, March 15. A very interesting programme was carried out.

Adolph Finke will graduate from the St. Louis College of Pharmacy next month. He will continue with J. P. Tierney's pharmacy, in the LaCade Hotel block, where he is very popular with the trade.

In a Sunday morning paper a leading dry goods house announced "patent medicines sold only by us at 33-1-3 per cent less than you can buy them of your own druggist." This is a sample of the cutting which is demoralizing to the retail drug trade here.

Owing to continued ill health of Joseph P. Tierney, proprietor of the well-established pharmacy in the LaCade Hotel block, at Sixth and Chestnut streets, M. M. Tierney succeeds to the proprietorship. The business will be continued without any further change.

Dr. Heine Marks, superintendent of the city hospital, is just now being raked over the coals for violating the ethics of the profession. His offense is said to have been the giving to the reporter of a daily paper a professional account of some operations performed at the hospital.

N. Hayes, from Detroit, has been in the city introducing shares of stock of his million dollar Universal Trade Association to the St. Louis druggists. The money value of this stock appears to be based upon his ability to secure the adoption of his plan and the purchase of his labels by the proprietors.

Francis Hemm, professor of practical pharmacy in the St. Louis college, about a year ago lost a valuable Torsion balance from his laboratory. Silence and keen detective work have finally located the instrument and a long list of chemicals, of which the hope of return had long since been abandoned. No prosecution is likely to follow.

Some newspapers are proposing that there be a law to compel all patent medicine manufacturers to have their compounds regularly qualified pharmacists.

CINCINNATI.

Cincinnati, March 22.—James S. Burdall, the veteran wholesale druggist, who is now the United States appraiser at this port, tells some interesting things about whiskey. The placing on sale of 1,000 barrels of re-imported whiskey has evoked endless comment here, and much curiosity is expressed as to why domestic liquor is sent abroad. Mr. Burdall was asked why it was done, and his reply was that in a general way it is supposed to pay to do so. It adds to the cost, through freight both ways, storage and other expenses, also loss by leakage and evaporation. But there would have been some loss if not exported. It will be noticed the internal revenue tax does not accrue till it is reimported. It may be kept out two or three or more years, and the interest on the tax, say \$36 per barrel, is saved. When the article comes from the still it is worth about thirty cents a gallon, or \$12 per barrel. The interest account would stand, say on one barrel of forty gallons for three years at 6 per cent, \$6.48; cost of whiskey, new, \$12, for three years at 6 per cent, \$2.16; net gain in interest per barrel, \$4.32. But in addition to this the article increases in value each year at least twenty cents a gallon. The tax on the liquor when worth thirty cents a gallon is just as much as when it is worth \$1 or \$1.50 a gallon. The chief gain is in the added value or quality. It is said that the peculiar climate of Bermuda and also Bremen in Germany improves whiskeys and ages them rapidly. Probably the long sea voyage out and back, especially in sailing vessels, that keeps it well agitated, tends to eliminate the fusel oil, and thereby improves and mellows it.

Pure whiskey is at its best in about ten years. It can be tested by agitating a sample with ether. Re-imported whiskey that has three or four years age will, as a rule, have but a small quantity of fusel oil, though it may have other impurities. Medically, our American whiskey, when properly made, ripened and freed from impurities—the chief of which is fusel oil—is certainly preferable to foreign spirits or brandies. But new whiskeys and chemically-made imitations and compounds are simply slow poisons that should be avoided as deleterious to health and life. A safe rule is to avoid using it except administered by a physician, and then insist upon having it pure.

Otto E. Betz, the Eastern avenue druggist, was sued for \$5,000 damages in Judge Kurler's court a few days ago by Miss Anna Karsner, of the East End. The plaintiff alleged damage to her health by receiving something other than laudanum at the defendant's store in March, 1893. The claim of the defense was that Miss Karsner was an habitual user of opiates, and that she took an overdose, causing retching of the stomach, etc. The plaintiff admitted that she took the stuff in a mineral water bottle, mixed with water. The verdict was for the defendant.

The leading theme in local drug circles during the past few days has been the mysterious disappearance of William M. Arons, the well known bookkeeper of the Standard Drug Company. Arons failed to put in an appearance on the 10th inst., and it was then learned that the bookkeeper was not at home. His haunts around town were visited without glean-

ing any information about him. When his wife learned that he had wandered away she became prostrated with grief, and was taken to the home of her mother on Grandin Road, Walnut Hills. Mrs. Arons was kept in total ignorance of what was going on and all visitors and newspapers were kept away from her. Her mother and sister recalled with terror a conversation Arons and his wife had in their presence, in which the husband, speaking as though he had a premonition of his doom, said, "Pauline what would you do if I were to die—would you follow me?" To which she answered: "I swear I would not live another hour." Knowing their fondness for each other, her anxious relatives looked upon the denouement with dread. Arons' looks were found to be straight. Searching parties were formed and the Ohio river and the canal were drugged. Finally his hat was found on the bank of the canal, as was also an empty morphine vial. Portions of this stream were again drugged, and on the 21st the remains were found in a terrible state of decomposition. The deceased was evidently insane. Arons was an intimate friend of Ed Cheney, the traveling salesman for C. P. Calvert & Co., who drowned himself in the Ohio river about two years ago.

Dr. R. H. Weatherhead, the well known druggist at Twelfth and Vine streets, has been elected director in the Edison Electric Light Company.

George Budde, city salesman for the Stein Vogler Drug Company, made a flying business trip up in the state the first part of the present week.

It is said that Melninger's new drug store in Cumminsville is the finest pharmacy in Ohio. All the shelf bottles are incased behind plate-glass doors.

Charley Footmeyer, who is taking a course in medicine, is now in charge at the drug store at Sixth and Central avenue, which was made famous by his late uncle.

Ed Gray, the druggist at Fifth and Main streets, is seriously ill at his home with pneumonia. He is improving, however, and his physician says he will soon pass the danger line.

L. N. Berube, the Avondale druggist, who recently purchased the interest of his partner, is making alterations in his beautiful storeroom. He expects to put in new fixtures and a new front.

Albert Ross, who has been in the drug business at Ninth and Vine streets for several years past, and who recently became a benedict, has accepted a lucrative position in a leading pharmacy at Dayton, O.

Herman J. Schulte, a graduate of the Cincinnati College of Pharmacy, who for a number of years was identified with the drug business in this city, has just been appointed appraiser of merchandise at this port by President Cleveland.

The name of John Bauer, the druggist at Sycamore and Milton streets, has been used in connection with a position in the Board of Police Commissioners, recently made vacant by the resignation of Samuel Nieman, who is a candidate on the citizens' ticket for City Auditor.

Harry Griffith, the traveling drug salesman who was formerly with Otto Raubfuss & Co. and the Standard Drug Company, was in the city the major portion

of last week. Harry is now connected with a prominent jobbing house at Columbus, and his legion of friends will be glad to know that he is doing well.

A purple chicken is on exhibition at Vorkamp's drug store in St. Bernard. It is an imported fowl, and is attracting much attention on account of its peculiar color. Some people have been cruel enough to contend that the feathers of the fowl have been colored with Easter egg dye.

Dr. John C. Otis is making extensive alterations in his store at Sixth and Vine streets. The pharmacy has just been re-papered, and some new fixtures now adorn the front part of the establishment. The doctor has just purchased a new circular showcase, which is attracting some attention.

A son of C. P. Calvert, of the Standard Drug Company, is spoken of as the next chief of the fire department of Covington, Ky. Young Mr. Calvert formerly traveled for his father, but of late years has been engaged in newspaper work in this city. He is well known for a man of his years, and is universally popular with all classes.

Billy Hale says he is happy to be again connected with his first and only love—Hale, Justis & Co. For six months Billy was out of the firm, but his true worth was recognized, and on the 1st of last January he went back to the above named firm. He is one of the leading and most familiar figures to be seen at the Drug Exchange.

Henry Kessler, a bright young pharmacist and a nephew of Rudolph Kessler, the veteran druggist at the Jewish Hospital in Avondale, is now behind the prescription counter at F. Kinzback's pharmacy, corner of Walnut and Court streets. Henry recently passed a very creditable examination for pharmacist before the Ohio Board of Pharmacy.

Albert Meininger, the Cumminsville pharmacist who is said to have the finest drug store in the state, has been appointed a member of the Ohio Board of Pharmacy by Gov. McKinley to succeed John Weyer, the Fourth street druggist. The appointment gives general satisfaction among local druggists, as Meininger is one of the best equipped pharmacists in this city.

J. B. Hoveler, the Central avenue druggist, was sued before Squire Winkler on the 21st inst. by George Meyer, a former clerk, to recover \$4.35 for wages said to be due. Meyer recently left the employ of Hoveler, and for his wages received a check on the City Hall Bank. When the check was presented for payment it was returned marked "no funds." Hence the suit. The matter will doubtless be compromised.

There is a veritable craze among the young pharmacists of this city in regard to the study of medicine. "We have sixteen druggists in our junior class this year," said a member of the faculty at a leading medical college the other day. Two or three well known retailers, who are also physicians, are fitting up offices adjacent to their stores. They claim they are patterning after their brethren in the east.

At a recent banquet at the Burnet House, given by the Cincinnati Paint Club, a resolution was passed asking President Cleveland to appoint a new member of his Cabinet to be known as

Commissioner of Commerce. A petition will be sent to Washington bearing the names of the foremost paint manufacturers and dealers of this city, Dayton, Springfield and Columbus. The creation of this new office is thought by the paint men to be a necessity.

The druggists at this place are taking a lively interest in the spring election, and members of the craft will cast their votes as they never did before. The citizens' movement has caught a number of them, and they are casting aside party views and will vote and work for the new party. Quite a large number, however, will vote for the candidates of the old-time parties, and the son of a seventh son cannot possibly foretell the result of the coming battle of votes.

The warfare on the slot machines in drug stores and other places of business, which was mentioned in a former letter, has not yet been begun by Chief of Police Deitch. The flood of nickels and pennies still goes merrily on, and nearly all of the downtown pharmacists declare that they will retain counsel to fight the abolition of the stamp and envelope machines, which are regarded as great labor-saving devices. Ex-Judge Miller Outcalt has been retained by the manufacturers of the machines in the coming legal fight with the police department.

EVANSVILLE, IND.

Wilbur Morden is now acting in the capacity of city salesman for Chas. Leich & Co.

The Bomm Drug Co. opened March 1st with a complete new stock and fixtures of modern design.

Peter Geil, who is in the city department of Chas. Leich & Co.'s drug house, is nursing a glass arm.

G. W. Vandusen, an Evansville product, now a resident of Philadelphia, writes that he is soon to return to this city.

John Wytenbach, recently with Geo. W. Haynie, has taken charge of Bomm Drug Co.'s prescription department.

C. C. Finney will in the near future be found in more elaborate quarters, having purchased a plat of ground near the Air Line depot.

Ed H. Niehans, formerly with Ben J. Bussing, Seventh and Main streets, has taken a position with Chas. Haynie on upper Second street.

Wm. Legeman, for the past fifteen years in charge of Chas. Leich & Co.'s shipping department, has been ordered out on the road by his firm.

Plans are being drawn for the erection of a two-story brick business house in the West End, known as Independence, to be occupied by a new drug firm.

Ed. Geil has returned from his maiden trip in the interest of his firm, Chas. Leich & Co. He traveled in the states of Kentucky and Tennessee.

J. C. Mendenhall, who recently opened a neat pharmacy at the corner of Fourth and Oak streets, has taken the agency of Tichenor's Antiseptic for this locality.

Chas. F. Forster has begun the erection of his new store on outer Fulton avenue. When finished it will compare favorably with any of its kind in the city.

Henry Brinker, doing business at the corner of Virginie and Heidelberg avenue, has had the serious misfortune of losing his mother, who succumbed to an attack of pneumonia.

CLEVELAND.

DR. ADOLPHUS BILLHARDT.

The first appointee to the newly created consulate at Moscow, Russia, is a native of Saxony. He was educated at Leipzig and in 1858 emigrated to America, locating at Upper Sandusky, O., as a physician. He served in the civil war as a private, hospital steward and surgeon, was held captive in a southern prison, and in 1864 obtained his release, thereupon taking up his practice at Upper Sandusky. In 1866 he built a \$30,000 block and established his drug business. In the town of his adoption he is noted as an enterprising, public-spirited citizen; at large, as a worthy, honorable gentleman. As officer, founder, promoter, he is connected with the Weather Bureau, Wyandot Saengerbund, Findlay Harmonia, Upper Sandusky Euterpean Chorus Club, Upper Sandusky Mutual Gas Works, Masonry and G. A. R. business. He is a sexagenarian and has a large and interesting family. The drug business will be continued by his sons.

Cleveland, March 22.—The local option status which the Haskell bill purports to create in this state will swear up the same conditions as have manifested themselves in New England and elsewhere. In other words, it would tend to involve local option town druggists in knavish practices, which in time would rob the pharmaceutical profession of its good repute.

R. A. Vance, the eminent local practitioner, is dead.

The new drug store at Oberlin, O., is owned by H. F. Smith.

G. L. Hechler's upper Broadway store will be improved to the extent of \$600.

The Jarecki Chemical Co., of Sandusky, reports business good with increased facilities.

The chemical laboratory of Case School of Applied Science is one of the best in the world.

The Cleveland member of the state committee of unofficial formulae is W. F. Kuder.

Mrs. Susan C. Knoppenberger, of St. Mary's, as president of the Empress Oil Co., has assigned her estates.

There is now a gradual but sure regeneration in all branches of trade noticeable, and everyone feels relieved.

Charles H. Richards, assistant to Dr. J. A. Diemert, is about to open a new store at Cedar and Jessie streets.

The Euclid Oil Company, capital stock \$10,000, is a recent Cleveland corporation. Burglars entered C. McCormick & Co.'s drug store at Doylestown and secured \$50.

The examination results attained by the pupils of the C. S. P. will be published in the next number of the Era.

W. S. Ferris, formerly with the Crystal Pharmacy on St. Clair street, is now with E. R. Lane & Co., Euclid avenue.

The Danmiller Co., of Canton, has been sued at Kent by the food commissioner for selling impure cream of tartar.

Druggists note an increased demand for paregoric, due to one of those narcotic fads which periodically afflict some people.

There is an inceptive boom in the paint, oil and varnish trades. New signs of prosperity are seen everywhere, paint especially.

Nelson Abbott, of Lima, passed through here on his way to Kalamazoo, Mich., to look after his purchase, the Leighton Pharmacy.

The Trommer Malt Extract Co., of Fremont, will be voted a bonus by the municipal council with which to improve its works and facilities.

Mattison & Saltzman succeed George Spangler and H. C. Harman at Burbank, O. The two stores, as above indicated, will be consolidated.

Geo. W. Canfield, Trumbull, and E. L. McElroy, Knox, have been reappointed state inspectors of oil for first and second districts respectively.

C. H. Hildreth, the Euclid avenue druggist, is back at his post after a protracted illness. John M. Ressler, his efficient assistant, has resigned.

The store of the Lord's Pharmacy Co., Pearl and Church streets, was again visited by burglars. Six dollars and some rare coins were stolen.

Certain conditions would indicate that none of the medical registration bills now before the general assembly will become a law this session.

Martin Schmitt is the successor of Charles W. Sheekley, 636 Cedar avenue. Mr. Sheekley has purchased a farm and will go into poultry raising.

Daniel Myers, as a member of the Chamber of Commerce, suggests the conversion of the Erie street cemetery into a site for the new city hall.

The fire in the Waring block did only slight damage to C. F. Fenton's pharmacy, but its escape from going into ashes was a miracle, nevertheless.

Frank Woods, popular through his connection with the Trommer Malt Extract Co., of Fremont, O., has cast his lot with a Port Jervis, N. Y., druggist, Fred W. Mason.

Arch E. Fowler, traveling for Benton, Myers & Co., mourns the loss of a satchel, with contents, and an overcoat, which were stolen from him on an outgoing train.

Col. Allan T. Brinsmade, U. S. district attorney, has approved the bond of Dr. Adolph Billhardt, the Upper Sandusky druggist who was recently appointed consul to Moscow.

A bill recently introduced in the state legislature provides that the graduates of dental or pharmaceutical colleges holding a charter from Ohio shall be admitted to practice without examination.

Druggist Billhardt, of Upper Sandusky, is celebrating his consular honors. During March he banqueted the G. A. R.'s

Masons, and on the 28th entertained 300 invited guests with a musicale and ball.

Tud Howard, the popular assistant to C. F. Fenton, is negotiating for the purchase of the People's Drug and Prescription Store on Cedar avenue, Owen B. Hannan, formerly with Strong, Cobb & Co., proprietor.

A. Irving, representing E. S. Burnham & Co., manufacturers of "Burnham's Clam Bouillon" and other food preparations, is in the city arranging for the company's exhibit to be held in connection with the Pure Food Exhibit at Gray's Armory in April.

Dr. C. S. MacKenzie, who was for over forty years identified with Cleveland's drug business, died in New York at the age of 84. Mr. MacKenzie left Cleveland about five years ago to make his home with his daughter, Mrs. Ferguson, and it was at her home that he died.

While Cleveland's glycerin product is shipped everywhere, she has not succeeded in outdoing Cincinnati, which at one time was the glycerin market of the country. The Grasselli Chemical Co., the principal glycerin manufacturers of this city, came here from Cincinnati.

The police have succeeded in ferreting out the thieves who systematically despoiled the cigar counter in Julius W. Deutsch's pharmacy. The depredations had become so frequent, and the manner so obscure, Mr. Deutsch came high believing in a supernatural warning that smoking was both costly and wicked.

Pew druggists may be conversant with the "practice of medicine and surgery" clause of the Mossrovo medical bill, now before the House. Under it a person would have to go to a doctor for a prescription if he needed a corn salve or a liniment for a bruise, for even a druggist would be violating the law by "recommending" a remedy for either.

The removal of the home of the Era from our neighboring city, Detroit, has caused a sort of forlornness among the Cleveland trade. "We are about to lose a near and dear relative," mused a wholesaler; "really, I don't know what we should do without the Era, in our leisure moments. Good luck to the Era in its new stamping grounds; it deserves all there is obtainable on this earth."

Abbott's pharmacy bill has been reported back to the senate. It has the support of many druggists, especially from the country districts. The bill provides that three months shall be designated during which any person who has worked in a drug store for five years may be registered as a pharmacist without further examination. Louis C. Hopp was delegated by the C. P. A. to present the utter fallacy of the bill before the legislature, which he has done in a manner worthy of the cause. There is no danger of the bill being enacted if sound opinion prevails.

It is probably not generally known that the Ohio State Board of Pharmacy owes its origin to Cleveland enterprise. The incorporation charter dates back to April, 1880, and bears the signatures of the following Cleveland druggists and chemists: Sylvester S. West, Lewis C. Hopp, G. H. Fenner, Nathan Rosenwasser, Alfred Mayell and W. F. Spiehl.

Lewis C. Hopp, of the Mayell-Hopp Co., of this city, will answer all questions relating to matters of the board or bills now before the Legislature, or will direct you to the proper source.

KANSAS CITY.

Kansas City, Mo., March 22.—Judge Thayer has handed down a decision settling the dutiable value of cocaine. The Board of Appraisers of New York City appraised the duty at fifty cents per pound. The Secretary of the Treasury was of the opinion that it should be taxed at the rate of 25 per cent ad valorem, and he ordered collector Richard Dalton, of St. Louis, to take the matter into the federal court, which he did. Many depositions were taken, and there were many who gave the opinion that it should be classed as a medicinal compound, as alcohol was an ingredient. Judge Thayer, however, decided that the duty is chargeable at the rate of 25 per cent ad valorem, thereby sustaining the position taken by Secretary Carlisle.

H. C. Arnold has been visiting friends in Denver during the past few days.

Burglars broke into W. E. King's drug store last week and stole a lot of cigars.

Radford has bought the drug store at the corner of Ninth street and Prospect avenue.

G. B. Swindle, of Swindle Bros., Baltimore, has been selling glass bottles in Kansas City.

E. F. Manuel was here recently representing the Philadelphia Prepared Chalk & Toilet Company.

C. E. Foote, of the firm of Foote & Jenks, manufacturers of perfumes at Jackson, Mich., was here recently.

J. G. Alexander was in Kansas City a few days ago introducing the non-secret preparations of Smith, Hubbard & Co., Decatur, Ill.

A fire broke out in J. W. Donohoe's store, 322 East Twelfth street, but was discovered and put out before any damage was done.

L. G. Blakeslee was in Kansas City a few days ago with compound stearate zinc in many combinations, made by McKesson & Robbins, of New York.

T. O. Robertson, now in Love's old stand on Main street, south of Missouri avenue, is preparing to move into a store in the New Ridge building on Main street, south of the Junction.

Robert J. Holmes has sold his drug store at the corner of Eleventh and Walnut streets to Dr. Boteler, of St. Joseph, and will give his whole attention to the carbonating works.

Fire broke out behind the prescription case in H. Moulton & Co.'s store at the corner of Tenth street and Broadway a few nights ago. The firemen turned a stream of water into the store, doing \$1,000 damage.

The druggists in the west are making themselves heard upon the revision of the tariff, and though Senator Cockrell seems to ridicule them, his "humor" is having just the desired effect in giving publicity to their protest.

A. R. Gage has tendered his resignation as city druggist in charge of the free dispensary, to go into effect April 1, when he will take a position in A. R. Beck's drug store at the corner of Sixth and Main streets.

George P. Ladd, the veteran druggist who was for several years with H. C. Arnold, and who has lately been with G. Howard Willett, has been compelled, by ill-health, to retire to his country home at Thayer, Mo. It is feared that he has consumption.

W. C. Wilson, president of the New York and London Electric Association, makers of the actina preparations, was arrested a few days ago on the charge of embezzlement, preferred by J. H. Lee, an engraver. The arrest was the result of a dispute about a few dollars.

J. A. Gallagher has sold his retail drug store near the corner of Eleventh and Main streets to the Johnson Bros.' Drug Company, formerly of Joplin, Mo. The store has been on the market since Mr. Gallagher became a member of the Evans-Gallagher Drug Company. Mr. Beck will continue as head clerk.

The Kansas City Paint, Oil and Varnish Club held its annual meeting at the Coates House a few days ago and elected H. D. Cutler president; H. W. Evans, vice-president; T. J. E. Pain, secretary, and A. M. Hughes, treasurer. After the business meeting the members sat down to a delightful banquet, with J. M. Sewall, the retiring president, as toastmaster.

Druggist George Eysell and Henry C. Morrison, who was formerly a druggist, have secured the Republican nominations for seats in the Upper House of the city council. W. E. King, president of the Kansas City Pharmaceutical Association, and Druggist George P. Hardesty aspired for the Democratic nominations, but were defeated in the convention.

Mrs. Mattie A. Wilson, a dressmaker of 1416 Grand avenue, brought suit in the Circuit Court for \$10,000 damages against J. G. Wirthman, a druggist at the corner of Sixteenth street and Grand avenue. She alleges that last November the druggist sold to her daughter, Eva Barr, 16 years of age, an ounce of laudanum without a physician's prescription or even asking the girl for what she wanted the poison. Eva no sooner had the drug than she took the whole dose, and a stomach pump was in order. For the loss of her daughter's services while she was sick Mrs. Wilson asks damages.

Clinton G. Nickells, formerly a druggist in this city, has been arrested in Minneapolis, charged with being criminally intimate with the wife of Druggist Willis Graham, who lives in Minneapolis and owns a drug store at the corner of Twelfth and Main streets in Kansas City. Mrs. Graham was a daughter of the late A. L. Mason, a millionaire. She is seeking a divorce in the courts at Wahpeton, N. D., and Nickells is also suing for a divorce from his wife. Mr. Graham swore out the warrant for Nickells' arrest himself after the actions of the couple were the cause of much gossip.

THE SOUTHWEST.

T. C. Lauber & Co. have sold their drug store in Byron, Neb.

P. J. Kearns has bought D. M. Titus' drug store in Denver.

The drug store of J. W. Turner & Co., in Coln, Ia., has been sold.

C. F. Ord & Co., have succeeded Arthur S. Adlin at Cambridge, Ia.

J. W. Burkett has moved his store from Como to Rosanky, Tex.

E. Davis has sold his drug store at Fillmore, Mo., to W. J. Barnes.

The firm of Robb & Newberry at Hallettsville, Tex., has been dissolved.

James R. Douglas, St. Louis, has given a chattel mortgage for \$1700.

Mrs. T. R. Armstrong's store at Beaver Crossing, Neb., has been sold.

Mulhern & Co., have moved their stock from Council Bluffs to Orient, Ia.

Kelley & Donovan have succeeded Kelley & Pierce at New Point, Nev.

The pharmacy of Doolittle Bros. at Sabetha, Ks., was burned out March 8.

William McClelland has sold his drug store and restaurant at Crawfordsville, Ia.

H. T. Dennis has taken a partner named Peters in his business at Galt, Mo.

In a fire at Newport, Ark., A. Joyce's drug store was damaged to the extent of \$300.

J. W. Bozman, Argonia, Ks., has given chattel mortgages aggregating about \$1,100.

The drug store of W. R. Nichols & Co. at Beaver Crossing, Neb., has been closed.

The drug store of Lee & Hall at Adrian, Mo., was almost destroyed by fire a few days ago.

Howitt & Oxley, druggists at New Enid, Okla., have given S. H. Craig a bill of sale for \$975.

Ewald H. Erfilingsdorf has given a chattel mortgage for \$2,000 on his store in St. Louis.

Mr. Richards has joined with J. Ehlinger in the drug business at La Grange, Tex.

Allie Ingraham has given a chattel mortgage for \$1,800 on the drug store at Fairfield, Ia.

O. C. Tobey has given a chattel mortgage for \$800 on his stock and fixtures at Salina, Ks.

A store building owned by Druggist Whitney at Burnet, Tex., was burned a few days ago.

The Cole Drug Company, of Dayton, Ia., has been incorporated with a capital stock of \$25,000.

Samuel Newcomer has bought a half interest in B. J. Foxworthy's drug store at La Junta, Col.

J. N. Lawler has bought the interest of his partner, Mr. Magers, in the drug store at Cool, Mo.

The firm of Morrison & Son, at Ottawa, Ks., has been dissolved. A. Morrison continuing the business.

The Estrella Medicine Company was made homeless for a time by a fire in the Temple building in St. Louis.

A. L. Jones has sold his drug store in Waco, Tex., and B. White has moved his store from Waco to La Grange.

L. H. Luckhardt is moving into new quarters in Tarkio, Mo. The store fixtures throughout are of solid oak, and the store is one of the prettiest in Northwestern Missouri.

The Labordine Chemical Company, of St. Louis, has been incorporated with a capital of \$20,000. Among the incorporators are C. B. Wonderly, A. B. Silverton and Emily F. Silverton.

The assignee of the Pacific Manufacturing Company in St. Louis has been ordered to accept the bid of \$525.50 made for the assets of the defunct concern by the Prickley Ash Bitters Company.

Shane's drug and jewelry store at McCune, Ks., was entered by burglars, who blew open the safe and stole \$1,000 worth of jewelry. They stole sixty new watches and one worth \$175, which had been left for repairs.

Dr. R. T. Miller, a druggist and manufacturer of proprietary medicines at Sedalia, Mo., has made an assignment. The

assets will not cover the indebtedness. Dr. Miller was engaged in business in Sedalia for thirty-five years.

George Gilbert Griffith, a young druggist at Des Moines, Ia., committed suicide by taking thirty grains of morphine March 13. He was despondent and probably half insane. He went to Des Moines from his home in Montezuma about three years ago, and at first went to work in Alfred Hammer's drug store, and a year ago went to the drug store of John Landholm.

Dr. S. M. McAnnally, a druggist at Marble Hill, Mo., was attacked by the Marble Hill Press for selling liquor. The doctor, who is 60 years old, met Thomas Allen, the editor, who is a stout fellow of 22, and whipped him thoroughly with a cowhide, then went before a justice and paid a fine of \$1 and costs. He will bring an action for libel against Allen and the W. C. T. U., who, it is alleged, inspired the articles.

C. R. Hulse & Co., druggists at Leavenworth, Ks., failed March 13. They gave eleven chattel mortgages on their stock and fixtures to secure claims amounting to \$323.96, and George A. Eddy, of Leavenworth, and the Evans-Gallagher Drug Company, of Kansas City, were put in possession, their claims amounting to about \$2,500. The failure was brought about by a suit filed against the firm by a St. Joseph man to recover \$820.

PEORIA, ILL.

Charles Rehuss was married to Miss Cora Porter at Washington Court House, O.

Peter Bourscheidt, having been in business for the requisite number of years without any perceptible vacation, thinks of taking a summer trip to Germany.

John F. Bush, chiefly known as "Dick," who shows himself every morning at the retail stores, for Colburn, Birks & Co., is sick. Grip. Albert Gillig does the honors for him now. A speedy recovery is wished by all who know him.

The Ryan Drug Co. is the successor to Jos. Wolf's pharmacy on South Adams street. Mr. Ryan is the manager and hails from Chicago, a graduate of the Illinois College. Julius Ulrich will be the assistant prescription clerk.

In the western part of the city are two druggists who have their rivalry more or less. Not long ago one of them issued a circular stating the excellent quality of his sarsaparilla, and agreed to give, up to certain date, a box of liver pills with each bottle purchased. Now the other one is going to give a package of toilet paper as a souvenir.

An unusual feature presented itself on the local pharmaceutical horizon lately in the shape of a dry goods house coming out in full blast with a large list of patent medicines, of the popular sort, at a great cut. As it happens to be a store not very well known and in a locality more or less out of the way it does not cut much of a dash so far, but looks very threatening. It seems as though the patent medicine evil is bound to come down and be only a means to catch suckers for the other stores. The retail association held a meeting over the matter, and came to the conclusion that if left alone it would die a natural death! Rather risky.

FROM THE SOUTH.

F. McTorkle, Chattanooga, Tenn., has failed.

W. E. Brown has opened a new store at Wallbrook, Md.

Brown & Co. are successors to M. C. Brown, Gainesville, Ga.

Jones & Cromwell, Florence, Ala., are succeeded by Wm. Jones.

W. S. Prather, Harlem, Ga., has gone into the bottling business.

E. E. Dixon, Gainesville, Ga., is succeeded by Dixon & Couch.

P. R. Holt, Deatur, Ga., is succeeded by Holleyman's pharmacy.

J. M. Duncan has purchased the Eagle Drug Store, Hillsboro, Tex.

W. P. Passmore, Hot Springs, Ark., has sold out to the Lower Drug Co.

A. E. Krosling has purchased the Lankford pharmacy at Houston, Tex.

W. T. Brooker, of Coleman City, Tex., has opened a store at Rogers, Tex.

Reese & Whitehead, Rome, Ga., have made an assignment to A. B. S. Mosely.

D. C. Curtis & Co. is the style of a new firm at 126 Deatur street, Atlanta.

J. C. Means has opened a very handsome store at 423 Main street, Natchez, Miss.

Robert Gibson succeeds Dr. J. P. Gibson, Shepherdstown, W. Va., who died a short time ago.

The U. P. M. Clark Drug Co., Davis, W. Va., has been incorporated with a capital stock of \$10,000.

Sexauer Bros., Wheeling, W. Va., have gone into business in the store formerly occupied by J. D. Van Law.

W. H. Robinson, corner Georgia avenue and Pryor street, Atlanta, has sold his business to J. W. Westmoreland & Co.

Tudor & Adams, Richmond, Ky., are succeeded by Mr. Hagan, a former partner of Powers & Hagan, of the same town.

N. J. Hatham, druggist at 117 West Mitchell street, Atlanta, committed suicide on March 9 by taking too much alcohol.

Frank Smith, who for years was with Dr. H. Baer, and later with H. Plenge, both of Charleston, S. C., has gone into business for himself.

The building and contents of the Mobile Drug Co., on St. Francis street, Mobile, Ala., were totally destroyed by fire the night of March 16.

The Lamar & Rankin Drug Co., Atlanta, Ga., have sent a petition to Senator Gordon protesting against the alcohol provision of the tariff bill.

The M. A. Theford Medicine Co. have entered suit against D. W. Curry & Co., of Rome, Ga., wholesale and retail druggists, for \$2,000, claiming that they have been selling liver medicine and black draught illegally.

The graduating exercises of the Atlanta College of Pharmacy was held at the Grand Opera House, March 6, with those of the Atlanta Medical College and the following had the degree conferred upon them: R. C. Hood, O. B. Hertzog and A. L. Moody.

The Spencer Medicine Co., Chattanooga, Tenn., have given a deed of trust, naming G. N. Henson, trustee, the president of the Citizens' Bank & Trust Co., their main creditors. By careful management their incumbrances can be removed, their assets being about \$50,000 and liabilities only \$11,585.

PACIFIC COAST.

A Chinese druggist named He Que died at Marysville, Cal., of apoplexy.

The Sheriff is in possession of the Hall Drug Co. store at Port Angeles, Wash.

McKnab's drug store at Spokane, Wash., was destroyed by fire a few evenings ago.

A meeting of the California Northern Medical Society was held on the 13th at Woodland.

The Washington Medical Association will hold its fifth annual meeting at Tacoma, May 21st.

E. D. Cutter, of San Jacinto, Cal., has opened a branch store at Moreno. Ward McKim is in charge of the Moreno branch.

Dr. Via's drug store, at Forest Grove, Or., was entered the other night by breaking a door casing, and some whiskey, wine and cigars taken. Two boys were found to be the guilty parties.

The Fresno County Medical Society held a meeting at which the subject of diphtheria was discussed at considerable length. Dr. W. L. Beebe, of St. Cloud, Minn., was an invited guest at the meeting.

The City drug store at Jacksonville, Or., has published a card in the local newspapers calling upon patrons to settle up.

Mayor Ellert, a druggist on Kearney street, San Francisco, has retired from the business in order to practice law. The purchaser of his drug store is Wm. B. Kirk, who has been in the place for a number of years.

The Garten Gold Cure Company has commenced an action in the Superior Court to restrain C. M. Way and S. M. Terrill from engaging in the business of curing coppers by maintaining an institution called the "Sacramento Gold Cure."

The drug firm of Hendricks & Reese, of Snohrough, Wash., are in a quarrel among themselves. A receiver was applied for but Judge Denny refused to grant the petition and has ordered an accounting between the partners and it is proposed to sever their community goods and separate.

There is a Chinese doctor holding forth at Redlands, Cal., who seems to be exciting a good deal of criticism among his white brethren who do not appreciate the honor of having a Mongolian professional in their midst. It is said the Chinese has no regular diploma or license to practice medicine.

A. C. Barnell, in behalf of the Redington Drug Co., of San Francisco, has caused an attachment to be issued against B. F. Springsteen, the druggist at 122 Ellis street, to commence a suit of \$1,054 due to goods delivered. Mr. Springsteen was formerly a prominent druggist in Napa City, Cal. He came to San Francisco a few years ago and located at the present site. Last fall he made a trip east and has not yet returned. He is supposed to be in Kansas City. During his absence his mother and her two daughters have located in San Francisco and taken up temporary residence in the rear of the store. A clash of authority arose between Mrs. Springsteen and Mr. Collins, the gentleman left in charge of the store, since which time business has been neglected and hence the attachment.

MICHIGAN UNIVERSITY NOTES.

Although a little late, we announce the gift by A. S. Parker, Ph. C., '79, of a balance for the prescription department.

Three beautiful large bottles of crude and pure glycerine were given to the school by the Gordon Chemical Co., Cincinnati, Ohio.

A large lump of "calcite," or crude nitrate of soda from Taropoca, Ch'ill, has been placed in the museum by S. M. Harris, of Moreton Farm, N. Y.

Class day will be Wednesday, June 27th, and in the afternoon the alumni banquet will be held. Everyone is interested and the indications are very promising for a fine time.

Any visitor last week to the portion of pharmacy building occupied by the senior pharmacists, could not have failed to notice that something unusual was on tapis; a good deal of quiet consultation was going on between the members of the class. The students gathered together in knots of three or four and each fished the actual interest felt.

Among the subjects of investigation to be done for graduation this year, in the School of Pharmacy, the methods of the new Pharmacopoeia will receive a good share of the work. It is hoped that some more exact work upon assay methods may be obtained. It is desirable to so divide the labor as to avoid unfinished results. Among the assay methods, there are quite a number of distinct factors that require a closer determination than has been made. Among other topics for investigation are an analytical inquiry into lard oil and its uses in pharmacy; a microscopical study of *Clusia maculata*; a comparative microscopical study of *belladonna* root and *scopolia*; the haemoglobins of the market, and others.

The Eberbach Drug & Chemical Co. have of late been making very practical and interesting displays of crude drugs and the finished products. A short time since the important medicinal leaves were heaped upon white papers and arranged on shelves at the sides and on the floor of the window. Later, about 20 of the gums, gum-resins, resins and balsams were neatly arranged and labeled, and elicited much attention and admiration. Their last display was somewhat suggestive of Easter and consisted of logwood, red saunders, and fustic; aniline colors in beautiful crystals, and many eggs dyed with colors of their own manufacture. This kind of advertising is appreciated and redounds to the credit of the firm.

The time had arrived at last for the selection of class-day performers. Unusual preparations have been made for the celebration of the time-honored custom of holding class day, and everyone is enthusiastic in making it as enjoyable and memorable as possible. In order to do this, it was recognized by all that the most representative members of the class should be upon the programme. It is but natural that the ideas for fitness of the various candidates should vary; that variation was the probable cause of the consultation and discussion mentioned above. The result of the election is as follows: Salutatorian, C. O. Topping, of Fenton; historian, James C. McGregor, of Elmhurst; poet, James Seymour, of Ann Arbor; prophetess, Miss Grace McNoah, of Ann Arbor; vaudeictorian, Chas. H. Williams, of Adrian.

PHARMACEUTICAL ASSOCIATIONS.

The American Medical Association will meet in San Francisco June 5th. The committee of arrangements has secured Assembly Hall for the general meeting and the Palace Hotel, corner Market and Montgomery streets, for the headquarters of the association. A registration room has already been opened for work in "Marble Hall," and "Parlor A" has been thrown open for committee work. Post office, section K, is also located in the Palace Hotel, where members can receive mail matter by having it so addressed. Arrangements have been made with the leading hotels for special rates, etc. Other information may be obtained by addressing R. H. Plummer, chairman, 622 Mission street, San Francisco, Cal.

Iowa State Pharmaceutical Association met in annual session at Des Moines, March 13 and 14, President Milo Ward in the chair. Reports of the secretary, treasurer and chairmen of committees occupied the first session. W. H. Torbert, of Dubuque, chairman of the legislative committee, offered a report which excited much discussion.

The following officers were elected for the ensuing year:

President—Milo Ward, Des Moines.
 Vice-Presidents—Mrs. S. C. Collins, Garner; E. M. Burns, Mason City; W. B. Elliott, Knoxville.

Secretary—Suel Spaulding, Indianola.
 Treasurer—J. B. Webb, DeWitt.

Professor Sherman R. Macy, of Highland Park College of Pharmacy, read a paper on "Pharmaceutical Education." A. M. Ruetter, of Dubuque, gave an interesting paper on "Assay of Tea." J. H. Harrison, of Davenport, spoke on the "Pharmacy Department of the State University." J. W. Ballard, of Davenport, read some sound logic on "Practical Pharmacy."

Dr. Gleim, of Des Moines, who has been in the drug business since 1833, was introduced, and by request took a seat by the president.

Mrs. Rosa Upson, who has been secretary since 1884, and who now retires, was made the recipient of many compliments, and a committee was appointed to draft resolutions of appreciation and to procure a suitable souvenir for Mrs. Upson. The next meeting will be held at Storm Lake in June, 1895.

St. Louis Paint, Oil and Drug Club.—The March meeting was held on the evening of the 15th inst., at the Mercantile Club. President Daugherty occupied the chair, with an attendance of twenty-eight. The committee on restrictive laws against corporations reported through Chairman O. H. Greene, that they were placing themselves in communication with all the other trade organizations of the city, and the prospects were that good progress would be reported at the next meeting.

The following communication was read from the Paint Club of Philadelphia:

"Whereas, Conclusive evidence has been brought to this club of the pernicious practice of salesmen and other employes being approached with a view to engagement by competing houses in our trade; therefore be it

"Resolved, That the Philadelphia Paint Club condemns the practice as unmercantile and detrimental to the best interests of all concerned; and be it further

"Resolved, That we bring the subject to the attention of the next meeting of the National Association."

In the discussion that ensued the general opinion was expressed that the members of this organization had no complaint of this nature to make. Nevertheless, it was a subject that should be called to the attention of the next meeting of the National Association, and the club so voted.

At the conclusion of the business meeting, the president introduced Mr. J. B. Follett, prominent in building association affairs in St. Louis, who gave an interesting address on "Money," illustrated by diagrams on a black-board. The address was a strong one in favor of the issuing of fiat money by the government as the necessities of the people seemed to demand.

At the conclusion of Mr. Follett's address, the unanimous thanks of the club were given him, and adjournment was made at a late hour.

Kansas City Paint, Oil and Varnish Club, on March 8th elected H. D. Cutter, president, H. W. Evans, vice-president, A. M. Hughes, treasurer, and Thos. Pain, secretary.

BOARDS OF PHARMACY.

The North Dakota Board of Pharmacy met at the "Metropole," Fargo, March 14th and 15th. There were twelve applicants, seven of whom passed a satisfactory examination, viz.: William Smith, Willow City; E. T. Haglund, Little Falls, Minn.; S. John Erickson, Hillsboro; J. W. Lucas, Bismarck; E. D. Holmes, Havana; R. K. Sattler, Michigan City, and J. J. Keen, Wahpeton. The following licentiates of other state boards were registered without examinations: G. O. Bundy, Emorado; R. A. Brackett, Fargo; C. F. Sayer, Neche, and J. H. Long, Hatton. Seventeen assistants were registered.

Kansas Board of Pharmacy.—The first quarterly meeting was held at Fort Scott March 7. Thirty-five applicants appeared, of which number the following were granted certificates as

Registered pharmacists—Thos. Bailey, Independence; F. W. Butler, Yates Center; J. W. Beasley, Carbondale; L. Colvin, Wichita; A. L. Dyer, Wichita; E. J. Fish, Sedan; H. A. Harmon, Phillipsburg; D. B. Hickey, Chanute; Leon Johnson, Summerfield; W. C. Laughlin, Hanover; C. L. McAdams, Wichita; J. E. Maxwell, Oswego; H. M. Ochiltree, Haddam; W. B. Roche, Genesee; G. W. Rice, Ashland; Ross A. Smith, Hill City; R. S. Treat, Hutchinson; E. B. Vanness, Mound City.

As assistants—C. C. Moore, Galena; G. L. Blatchley, Fort Scott; Ed. Brewer, Peabody; E. A. Laudevehkamp, Leavenworth; F. Orloff, Atchison; D. Phillips, Concordia; W. D. Benham, Pleasanton; J. L. Carter, Emporia.

The next meeting will be held at Hutchinson, June 6. H. W. Mehl, secretary, Leavenworth.

South Carolina Board of Pharmacy.—At the last session of the legislature some important amendments were made to the charter of the state association. Physicians are now required to stand an examination in order to procure a pharmaceutical license. The charter was amended in the matter of the State Board of Examiners, which now elects six members (pharmacists), four from the city of Charleston, and two from the interior of the state, to serve, respectively, one, two, three, four, five and six years,

and hereafter there will be elected one member to fill the vacancy every year. Examinations to be held every four months, and it is the intention of the board to hold examinations in different parts of the state. The new board is comprised of E. S. Burnham, chairman, Charleston; A. A. Kroeg, Charleston; Henry Plenge, Charleston; R. B. Loryea, Manning; O. E. Thomas, Columbia; H. W. Hummel, Charleston, secretary. The first meeting of the board under the new regime was held in Charleston March 6th, when four applicants presented themselves for examination. The following passed and were awarded licenses: Wm. Royal Rouse, Geo. H. Thompson, W. J. Prince, all of Charleston. The percentages gained ranged from 72.2-3 to 82.1-6 per cent. The next meeting of the board is expected to be held in Columbia.

Wisconsin Board of Pharmacy met at Green Bay, March 20. The following were granted registration without examination, they having passed examination in other states: I. K. Fox, Marinette, from Michigan; John G. Kissel, Olenwood, from Minnesota; Henry B. Cate, Stephens Point, from Illinois; graduate certificates to H. A. Peters, Oconomowoc, he having passed examination in 1892 at the Department of Pharmacy, State University.

At the examination there were thirty-nine applicants. Of this number the following received licentiate certificates: J. H. A. Schultz, Milwaukee; C. H. Law, Green Bay; J. H. Look, Sheboygan; W. T. Boulter, Green Bay; E. S. Flemming, Eau Claire; C. A. Groffman, Manitowoc; F. G. Tanck, Watertown; John F. Clarke, West Superior; C. M. Smith, Oconomowoc; T. E. Pritchard, Fond du Lac; H. Lichtenwalner, Monroe; A. W. Brennecke, Racine; Henry Hillmantle, Milwaukee.

Assistant certificates were granted to Kate McPhail, Osseo; A. T. E. Benn, Colby; W. H. Barnes, Milwaukee; D. H. Tennant, Janesville; S. Boulanger, Grand Rapids; S. J. Coulter, Marinette; W. H. Evans, River Falls; Peter Venenia, Marquette; J. T. Vecke, Milwaukee; J. T. Hayden, Butternut; C. W. Trickle, Brownstown; S. H. Brownlee, Ellsworth; A. Schaght, Milwaukee; Frank Piszczek, Milwaukee; A. E. Marquart, Sauk City; G. M. Breakley, Alma Center; O. B. Olsen, Marinette; R. S. Williams, Martell. Eight were rejected.

Henry C. Schranck, of Milwaukee, was elected president of the board and E. B. Helmstret, Janesville, elected secretary and treasurer for 1894-5, his thirteenth election to this office. Meetings for examinations were fixed as follows: June 13, Madison; August 17, Racine; November 14, Milwaukee; January, 1895, Milwaukee; March, 1895, Baraboo. The secretary was directed to visit all parts of the state where complaints are made of violation of the law, and that all cases of same be pushed.

The Atlanta College of Pharmacy held its annual commencement on Tuesday, March 6th, at the Grand Opera House. There were three graduates, O. B. Hartzog, of South Carolina; A. R. Moody, of Anniston, Alabama, and R. C. Hood, of Harmony Grove, Ga. The opera house was crowded, about 2,000 people being in the audience. Col. N. J. Hammond, president of the board of trustees, delivered the diplomas. Every indication points to full classes next year, a large number having already promised attendance.

CORRESPONDENCE.

We accept no responsibility for the views and utterances of our correspondents. Contributions must carry full name and address of the writers, which, however, will not be published, if so requested. Copy should reach us ten days in advance of date of issue.

DIDN'T NEED IT.

The following interesting reply was returned to a circular letter soliciting subscriptions to a certain medical Journal. It is sent us by Mr. C. L. Katz, Terre Haute, Ind.:

Terre Haute, Minn, February 21, 1894.

Your copy of the — Journal came, and the letter to—askin me to send fifty cents and git it for a year. I don't need no journals. When I git a tuff case I go off inter sum scrip place and tell the lord all about it and wate for him to put inter my minde what ter do. Thats bettern journals and nsyklopedes and such. If we hed more lord trustin doctors and less colleges weed fare better. The lord noes morn all the doctors and if we go to him for noledge it ill be bettern journals.

Fraternally in the lord,

A CHRISTIAN DOCTOR.

P. S.—I've practisid medisen morn fifty yeers. Yore ken publish this letter if you want ter.

THE TAX ON ALCOHOL.

To the Editor:

Will you permit me to make a suggestion to the druggists of the country through the columns of your Journal? If prompt action is taken, I am confident it will have a good effect.

Recently Mr. W. H. Torbert, chairman of the Iowa committee on legislation, sent out a circular requesting druggists to write their senators at Washington protesting against the proposed increase in the tax on alcohol. Instead of writing a personal letter to each of the senators from our state, I prepared two petitions and sent one to each of our senators. The petitions were as follows:

"Hon. ————

"United States Senate,
"Dear Sir,—The undersigned druggists, residents of the city and county of Lebanon, Pa., respectfully request you to use your influence to prevent a further increase in the tax on spirits. Alcohol, one of these products, enters largely into the manufacture of all medicines and is used in the arts and manufactures. It now pays a tax of about \$1.70 per gallon, fully five times its actual value, and a further increase is wholly unnecessary and will be burdensome to those who are compelled to use medicines.

We pray you, therefore, to endeavor to prevent a further increase in this tax."

To these two petitions I secured the signatures of all the druggists in the city and a few from the country who were easily reached, and sent them to our senators, and two days after received a letter from Senator Cameron saying the suggestions contained therein would receive his earnest attention when the bill came before the senate.

I am persuaded that if the druggists of the country will act promptly and either write individual letters or send petitions similar to the above to the senators from their states, an increase in the alcohol tax can be prevented. Move at once. There is no time to lose, as the bill is now pending in the senate.

J. H. REDSECKER.

Lebanon, Pa., March 21, 1894.

THE MICROSCOPE.

To the Editor:

With one exception the Era contains information for almost all the wants of the retail druggist. This exception, a very important one, is microscopy.

Every progressive druggist should be the possessor of a good compound microscope and use it almost daily. It is indispensable in the identification of the various drugs and chemicals of which his stock in trade consists, and the adulterations too often found in them.

The pleasure and knowledge derived from it are not confined to these, but embraces every material thing with which we come in contact. The botanist can do little without it; the geologist in his final work depends upon it; and the physician finds it of the utmost importance in many diagnoses. In fact, its uses are almost infinite and of the greatest importance.

We are very desirous that the Era give this subject space and encourage communications upon it, not of a highly technical character, but of use in every day work on common objects.

Those commencing or contemplating doing so can derive much assistance from an interchange of ideas. Those of riper experience can give much valuable information, and incidentally gain some. Let us hear from the interested through the Era.

A. F. M.

A FEW WORDS ABOUT PATENTS.

To the Editor:

Having studied the modern pharmaceutical chestnut known as the cut-rate problem for some time, I venture to offer a few remarks to your readers. First of all, has the proprietor of any widely advertised nostrum ever really tried to protect the retail druggist? Plans innumerable have been suggested, most of them "bluffs" calculated to deceive the druggist and keep him quiet. It is a very easy matter for the proprietors to protect us if they want to. The U. T. A. or some similar plan would work excellently. The package thus marked could be traced at once. But any plan is useless as long as the manufacturers are not sincere. Where do the large department stores get their supply of patents and how are they enabled to sell them in many instances for far less than they cost the druggist? By allowing cutters to handle their goods, they sell more than in the legitimate trade simply handled them. The patent men are simply trying to play two fiddles with one bow.

Do you think they care two whoops in purgatory about our welfare? Not a bit of it. They care no more for us than the high tariff millionaire does for his fifty-cent-a-day "protected" laborer. Some time ago the agent for a certain patent told me openly that he wanted to sell all the goods he could and did not care whom he sold to. He even went so far as to say that to cut on his goods was just such an advertisement as he wanted. Who is it that calls you a liar, a pirate or a thief?

The druggist must work out his own salvation. Buck the patents for all you're worth. Don't display any packages or bottles of their compounds. The first free advertising you give a patent is putting it on your front shelves. Do not allow your name to be used or in any way connected with their ads, and never distribute their almanacs or similar matter. "Make them yourself." Put up a

good line of harmless but effectual remedies. Don't claim that your cough medicine will grow a new lung or that your liniment will grow a new limb.

Such things as a cough syrup or a toilet cream should also be put up in small sample bottles, and enclose one in each package of similar goods sold. It you have good formulae and packages nicely put up this plan will most always have the desired effect. Item—Remember that in popularizing patents you are cutting your own throat, financially speaking, and the sooner you awaken from your dream of "plans" and get to work in earnest the better it will be for you and your family.

March 7, 1894

A RETAILER.

WHAT THE DRUGGIST MUST KNOW.

- 3 cts of Gumrubic.
- 2 cts of Spirm.
- Pleese Sende Me 10 Cents Wirth of Gume Opapm.
- 10 cts worth of Capshin plaster.
- 10 cts worth of Tulu.
- Half a pound Sulfar.
- Cultar pound salt peator.
- 1 OunCe of Antimonia.
- 2 OunCes of Innlbreak.
- 1 pound of GinGer.
- Half pound LeKris root.
- 1 OunCe of Anisce Seade.
- Argot, 25 cents worth.
- Gross of Supplement.
- 5 cents worth of camille blows.
- 5 cents worth of golden ceel roots.
- Acme carage wine palnt.
- Orange dimons dye.
- Equil parts Hartshorn and Lavlinder.
- 2 ozs buchulle.
- 2 drams Uva Urisa.
- 2 drams spirrits niter. One half tea-cup Sugar. Desolv and ad.
- One half pint thirpentine.
- One ounce cloriform.
- One ounce muriatic asid.
- One ounce anonia.
- Give my Girl one dolar bottle of shal-owes consunsm cure.
- 5 cents worth of Gosmeline.
- 1 ounce of Wichasel.
- 1 ounce of Sassaparilla.
- 1 pint Borbon whiskey.
- Send 10 cents too gr Quinine pills.
- Dr Climore Swamp Root.
- A box of Heric pills.
- 1 lb of Rasom.
- One half pint Alcahah.
- 1 oz. Mandrac Root.
- 1 oz Dandallion Root.
- 1 oz bucha leavs.
- 2 oz Magunda Pich.
- 1 oz Campher gum.
- 1 Pt Linsaad oil.
- 1 lb of black antimonia.
- 1 lb of Epseum Salts.
- One fourth lb of Blood Root.
- 1 lb of Fenegreek.
- 2 oz Gensen.
- 2 oz Hipoisite of Soda.

Mr — Sende Me One haught on Ounc of Oapan. donte leet the Boy seccay what you dow up, and send me 5 cts wirth of winter. G. L. B.

- Bracle Ac. B.
- Asitate of Potash, one dram.
- Pleas send me half pint Hollon gin and one oz Wondrn milk weed.
- Salselle Acid.
- 1 stick seeling wacks.
- Chamberlains diarie cure.
- PinKrat to color Oke.
- Murrat Assid.

F. E. HERRICK, Groton, N. Y.

GILMAN BROS., BOSTON.

JOHN A. GILMAN.

GORHAM D. GILMAN.

IN an unostentatious manner characteristic of the old house of Gilman Brothers, of Boston, a change of quarters has lately been made from Washington street to Franklin street, and the event turns one's thoughts retrospectively.

The firm originally consisted of Gorham D., John A. and Samuel K. Gilman, who began business, under the firm name of Gilman Brothers, in May, 1863, having purchased the drug department of Messrs. James R. Nichols & Co. in the store located at 109 Milk street. There they continued business until the disastrous fire of Saturday night, November 2, 1872, which swept away the building occupied by them in the general destruction of that part of the city. The junior partner was the only member of the firm in town at that time, and superintended the removal of a small part of the stock of goods (all that was possible) to Boston Common, where it remained until new accommodations could be secured. Arrangements were made at once for opening a store on Custom House street, and the firm was enabled to fill orders for goods on the Monday following, so that there was no serious interruption to business on account of the fire, although the financial loss in consequence was large. After a year and a half spent on Custom House street the firm secured the store No. 307 Washington street, in the spring of '74, where for nearly twenty years they conducted a constantly increasing business. In December, 1879, the junior member of the firm died, and the business has since been carried on by the two older brothers. By strict attention

to business and the personal care taken in the selection of goods, they have won the confidence of their patrons and a reputation for fair dealing and the purity of goods sold by them, that is second to that of no other house in New England.

In taking possession of the large and commodious store at 50 Franklin street they have secured one of the best and most central locations in the city (in close proximity to the main offices of the five largest express companies doing business in New England). This affords them much more advantageous opportunity for the transaction of the wholesale drug and manufacturing business, to which they now give their exclusive attention, having discontinued the retail department. The counting-room is especially light, airy and convenient for transaction of business. Their workrooms may fairly be said to be models of convenience and utilization of space, occupying three floors in the new building, which, together with their large accommodations for the manufacturing department and storage of goods at No. 42 India street, furnish ample facilities and place them in a position to fill promptly all orders which are sent to them.

Gorham D. Gilman was born in Hallowell, Me. He attended the public schools and academy of the town, and later acted as clerk in a store, thus obtaining an experience and education which has proved valuable in the later years of his career.

Leaving home in the pursuit of business, he was for twenty years a resident in the Hawaiian Islands, engaged in gen-

eral mercantile pursuits. While there he became well versed in the island language and enjoyed the confidence of the successive kings, and of the common people, and up to the present time maintains very close relations with the affairs transpiring in the island kingdom.

He has received three honorable decorations for "services rendered" from the royalty of those islands.

He served in both branches of the city government of the City of Newton, where he resides, for three years. In 1889 he entered the legislature of the Commonwealth of Massachusetts, as a member of the House of Representatives, and was re-elected to serve the second term in that body in '90. In 1891 and '92 he represented in the Senate chamber the senatorial district in which he lives. He is a member of several Christian, philanthropic and social organizations.

John A. Gilman also was born in Hallowell, Me., and in 1853 entered the retail business in that city as clerk, where he remained until 1858. He then purchased the store where he had been employed and began business under his own name, continuing it until the spring of 1863. Being desirous of finding a larger sphere he had several conversations, on his trips to Boston to purchase goods, with Mr. Billings (who was then the junior partner of the firm of J. R. Nichols & Co.), which resulted in the purchase of the drug department of their business by Gilman Brothers. Since that time Mr. Gilman's attention has been given exclusively to the management of their business.

TRADE COMMENT.

DIRECTORY SUPPLEMENTS.

The third (1894) edition of the Era Druggists Directory has now been issued, and the regular publication of the "Supplements" to this new edition was begun in the (February 1st) issue of The Pharmaceutical Era. We solicit from our readers information regarding any changes among the drug stores in their locality, such as new stores, removals, sales, failures, deaths, etc., etc. Address

D. D. HAYNES & CO., Publishers,
DETROIT, MICH.

The firm of Dr. D. Jayne & Son, Philadelphia, has just completed the distribution of five million pieces of advertising matter.

Professor—"How long should a man's legs be in proportion to his body?" Mr. Lowland—"Long enough to reach to the ground, sir."—*Yale Record*.

Bare & Barb is the name of a new firm organized to carry on the manufacture of medicines, elixirs, etc., at 522 VanBuren street, Topeka, Kansas.

The heat Venetian red is now made from copperas, but it received its name originally from the Venetians, who produced it in a natural state from oriental countries.

Lenon grass, *Andropogon ag.*, the source of a lemon-scented etheral oil, coming from the East Indies, has been found to be quite well adapted for cultivation along the coast of southern California.

Red glass is to be tried in one of the small-pox pavilions at North Brother Island, New York, in order to test the value of the experiments made by Drs. Lindholm and Vinsen, of Bergen, Norway, who claim that the pitting of small-pox patients is due to the sensitiveness of the skin to violet rays of light.

Sir Lyon Playfair in a recent number of the North American Review, contributes an article on "Waste Products Made Useful," in which he has this to say regarding certain practices in Paris: "Of all living things rats seem to be among the most repulsive, and when dead what can be their use? But even they are the subjects of production in the industrial arts. In Paris there is a pound surrounded by walls into which all dead carcasses of animals are thrown. A large colony of rats has been introduced from the catacombs. The rats are most useful in clearing the flesh from the bones, leaving a clean-polished skeleton fitted for the makers of phosphorus. At the base of the wall numerous shallow holes are scooped out just sufficient to contain the body of the rats but not their tails. Every three months a great "battue" takes place, during which the terrified rats run into their holes. Persons go round and catching the extending tails, pitch the rats into bags, and they are killed at leisure. Then begins the manufacture. The fur is valuable and finds a ready sale. The skins make a superior glove—the "gant de rat"—and are especially used for the thumbs of kid gloves, because the skin of the rat is strong and elastic. The thigh-bones were formerly valued as tooth-picks, but are now out of fashion; while the tendons and bones are boiled up to make the gelatine wrappers for bon-bons."

One result of the fierce competition now waging in the sugar of milk industry has been the assignment of Wm. E. Smith, president of the American Lactose Co., whose plants are located at South Plainfield, N. J., and Leon, N. Y. It is reported that the assets are much greater than the liabilities.

The fruit of the (gallery) gods, peanuts, now seems to be occupying a prominent place in the minds of our scientists. The peanut has been recently placed in an enviable position as a food and medicinal product, but it has remained for a writer in the New York Sun to bring it forward as a rival to the many cures for leprosy. He has discovered that the nut has a faculty for absorbing alcohol and preventing its demoralizing effect upon the system, while the exhilarating and tonic effect of the liquor is retained. Orders for "Brandy and—" now mean "Brandy and Peanuts."

American merchants are apparently becoming alive to the fact that foreign trade can only be secured by going after it. A number of merchants and manufacturers of New York have organized a Pan-American Permanent Commercial Exhibit, which will open May 1, at the Industrial building, Forty-third Street and Lexington avenue, where over 300,000 square feet of floor space has been secured for exhibition purposes. The organization proposes to send traveling representatives to South American countries to introduce the goods of this country and take orders for the same. Such orders, however, will be handled through regular commission houses as it is the intention of the exhibit organization to act only as promoters of trade.

Pyrethrum appears to be grown on a commercial scale in this country thus far only in California. The extensive use of pyrethrum powder as an insecticide has excited considerable interest in the culture of the plants used for that purpose, viz.: *Pyrethrum cinerascifolium* and *P. roseum*. These are composite plants with flower heads somewhat resembling single chrysanthemums, which, when pulverized, form the Dalmatian, Persian and Buhach insect powders. The *P. cinerascifolium* has found great favor in California, and its culture in Merced County, as well as in Los Angeles County, has assumed large proportions. The culture of this species, so far as known, has only been carried on on level land with plentiful irrigation, but the fact that nearly all species of pyrethrum are natives of mountains, seemed to indicate that the hot plains would not be the best place. Experiments in the Santa Cruz mountains indicated the success of this species there. While *P. roseum* is the prettier species, it cannot compete with *P. cinerascifolium* in culture for profit. Its yield is not one-third of the latter, notwithstanding its larger heads. It produces but few good heads the second year, and its flowering is so gradual that all the heads are not ready for gathering at one time. Experiments with *P. roseum* in New York state were fairly satisfactory; the plants failed to bloom the first season, but endured the winter unharmed and gave a profuse crop of blossoms the second season. Trials of powder made from these indicated as much or more strength than that of the California powder.—U. S. Experiment Station Report.

A recent test of brick made by the dry clay process at the Watertown arsenal showed an average compressive strength of 3,972 pounds per square inch.

According to a report of the United States Consul at Seoul, Korea, the people have been experimenting in political economy, using rice as an object lesson (unseasonable weather during the months of September and October had so affected the rice crop that a famine was feared) and the government announced that the export of grain was prohibited. Later this was modified to include only cereals, and exclude beans, which are one of the chief articles of export. After these matters of legislation had been fixed the weather improved and the crop was found to be nearly up to the average. The result of the prohibition was that the price of rice steadily appreciated, the growers held on to their crops, and the stock on the market was exhausted. As the methods of communication in Korea are of a primitive nature, it took the government some time to reverse the legislation, which had the effect, for a time, of almost entirely suppressing trade. Korea is very short of available currency, and all imports are paid for by exports, and the stoppage of one means a falling off of the other.

Although there is a sense of weariness induced whenever tariff bills are mentioned, the fact that the finance committee of the Senate has reported upon the Wilson bill will no doubt call forth a sigh of relief. Senatorial dignity will now discuss the following changes in the chemical schedules: Tartaric acid, reduced from 20 to 10 per cent. Alumina, increased from 20 to 30 per cent. Coloring for liquors, reduced from 50 to 30 per cent. Glycerine, from 1 and 3 cents for crude and refined respectively, changed to 20 per cent ad valorem. Iodoform, changed from \$1 per pound to 25 per cent ad valorem. Licorice, changed from 5 cents per pound to 25 per cent ad valorem. Magnesia, changed from 7 cents per pound to 30 per cent ad valorem. Castor oil, changed from 35 cents per gallon to 30 per cent ad valorem. Olive oil, changed from 35 cents per gallon to 25 per cent ad valorem. Peppermint oil, reduced from 25 to 20 per cent. Fish oils, reduced from 25 to 20 per cent. Opium, extract of, for medicinal uses, changed from 25 to 20 per cent. Baryta, changed from \$3 per ton to 25 per cent ad valorem. Blues, changed from 6 cents per pound to 20 per cent ad valorem. Ochres, etc., changed from 1 1/2 cents per pound to 25 per cent ad valorem. Whiting, changed from 25 to 35 per cent. Zinc, changed from 20 to 25 per cent. Bichromate and chromate of potassium, changed from 20 to 25 per cent. Hydriodate, from 25 cents per pound to 10 per cent ad valorem. Medicinal preparations, such as cosmetics, from 40 to 30 per cent. Toilet soap, from 35 to 30 per cent. Bicarbonate of soda, from 1/2 cent per pound to 30 per cent ad valorem. Hydrate of soda, 1/2 cent a pound to 25 per cent ad valorem. Bichromate and chromate of soda, from 20 to 25 per cent. Sal soda, or soda crystals, 1/2 cent per pound to 20 per cent ad valorem. Silicate of soda or other alkaline silicate, 1/2 cent per pound to 20 per cent. Cream of tartar and patent tartar, 25 to 20 per cent. Tartar and lees crystal, partly refined, from 25 to 30 per cent. Soda ash, 1/4 cent per pound to 20 per cent ad valorem.

DRUG STORE MANAGEMENT. Buying and Selling.

Were it not for the fact that many fall in business, the mere act of purchasing goods and then selling them to other people might be considered as a very simple operation. But this fact of failure shows that there are many things to be done and many to be left undone in connection with these vital business transactions. Taking a merchant starting in business with a fairly adequate capital, in a neighborhood which can properly bestow upon him a fair amount of patronage, and the argument should be in favor of his success, in buying at wholesale certain goods which the public is in the habit of using, and in disposing of them at a certain advance over their cost, retaining the difference between these prices as his justly earned reward. This is the theory of merchandising which underlies all success, and as theories are constructed more or less upon observation of previously existing facts, the failures must be attributed to defects in practice. Many of these defects are due to personal characteristics which debar certain individuals from becoming successful business men. There are certain mental, moral and personal qualities which the public do not like and will never be educated into liking, and the only relief for the unfortunate possessor of such qualities is an education in a school for deportment.

Where competition is as keen as it is at the present time, and trading goes by favor, department, in all the varied aspects which the word implies, is one of the greatest known factors in selling goods. This is quite apparent when it is noted that the tradesman of to-day is in the habit of saying "Thank you" at the completion of transactions between himself and customer. This "Thank you" is not strictly necessary where both parties are supposed to be mutually benefited by a simple change of commodities, but it is quite the fashion for the seller to tender this courtesy to the buyer as a reward to the latter for not trading elsewhere, all of which goes to show that trading goes by favor, and that proper deportment, diplomacy and a regard for the amenities which mark the conduct of social affairs are quite important adjuncts in the selling of goods. These are, in fact, the first things on the list to be acquired when buying merchandise to be sold again, and a constant remembrance of the difference in the fly-catching qualities of molasses and vinegar will be of service to the man who wishes to catch customers.

The next thing to be considered is the application of the old saying, "Goods well bought are half sold." As regards buying staples, nothing need be said, as no man has an excuse for entering business without a fair knowledge of these and their qualities. But there is perhaps no business in which so many articles of doubtful selling qualities are offered as in that of the retail druggist. It requires the keenest judgment to determine the selling qualities of the novelties, and new medicinal preparations which are daily brought to the retailer's notice. The only safe plan is to follow the natural law of supply and demand: let the demand come first, and keep the supply almost to the famine basis until the public appetite becomes thoroughly whetted. Where the sale of goods depends upon

advertising, let the advertising go on ahead—quite a distance ahead, too. Experience with dead stock will convince nearly every druggist of the wisdom of such a course, but it is right here that the qualities of the good salesman come into play. It is rarely the case that articles are put upon the market without possessing some intrinsic value, but there are any number upon which the druggist errs in judging the selling qualities. In cases of this kind there should be redoubled efforts to show the public the value of the goods, and every means of advertising should be resorted to. It is surprising what a little determined effort will do in reducing dead stock.

A plan which is in successful operation in several sections of the country, in other lines of business, is that of exchanging commodities which have, from various causes, become unsalable. This is effected by thorough local organization of the trade which adopts the plan, and is carried out by members of an association listing with a secretary or some specially appointed officer, such goods as the members find are of slow sale, or of which they have a surplus. These lists are printed and distributed at certain intervals to the members, who often find goods thereon which they happen to be in need of, in which case the seller is usually willing to make a concession, or the exchange can be made in goods. It is the duty of the secretary of such a body to simply put parties in communication with each other, the details of the trade being attended to by the persons interested. This plan has proven quite economical in the grocery business, and it would seem to be particularly applicable to the patent medicine portion of the drug trade. As is well known, goods of this character are often in brisk demand in certain neighborhoods, due sometimes to special advertising, or to some "great cure" which has been brought to public notice, while in a locality a few miles distant the same preparations may be dead stock. In instances of this kind an exchange would be of mutual benefit. This plan also has a tendency to cause greater attention to be paid to the handling and storage of goods to prevent their becoming damaged or shopworn, as the druggist would then learn that the public does not care to purchase shopworn goods, any more than he would desire to purchase the same from a fellow druggist. Goods which have to be sold with an excuse for their appearance are not regarded favorably by the purchaser.

It has long been the habit of the pharmacist to scold the physician for carelessness in writing prescriptions, but what excuse can be made for the druggist who displays the same carelessness in ordering goods of his wholesaler? Surely the man who makes a mistake in ordering goods is open to as much criticism as the physician who errs in prescribing, although the consequences may not be as disastrous. Too much care cannot be exercised in ordering goods. In this day of cheap paper and ink, there is no excuse for abbreviations and puzzles for the jobber to get distracted over, and finally solve by guessing. The minutest detail regarding goods wanted should appear upon the order for them. It pays better than paying freight on goods not wanted, and postage on scolding and explanatory letters regarding the same

Where orders are given to a traveling man, a duplicate copy of the order, as sent to the firm, should be retained by the merchant. Where orders are sent by mail, they should be copied, and the only practicable means of doing this is to write them with copying ink, and take a fac simile of the same by means of a copying press. This method locates all mistakes in ordering, prevents all disputes as to who is to blame and is just to all parties concerned. These copies of orders, as well as the invoice, should always be checked off when goods are unpacked, and comparison made between them.

It is only by the exercise of constant vigilance that proper observance of these apparently petty details can be secured. Many think the "game not worth the candle"—but as stated before, many people fall in business, and among these latter are a large number who let details take care of themselves. The habit of training our apothecaries to regard matter as composed of atoms and molecules should be extended to their business training. The large and successful business is made up of multitudes of little business atoms, and any weakness or disproportion in the latter affects the former. The retailer, in dealing with his jobber, should be exact and precise in ordering what he wants, and he should be just as exact and precise in seeing that he gets what he orders. It is the policy of all reputable houses to furnish their customers what they want, and if no complaints are ever made no improvement will ever be made in matters which are capable of improvement. All deficiencies in quality, price and packing of goods should be attended to promptly by the retailer, and all blame for such deficiencies should be placed where it belongs, even if the matter has to be traced back to the producer. The retailer should protect the consumer, and he can only do this by insisting upon being supplied with goods that do not have to be sold with an excuse or brought back for an explanation. An attention to even defects which are apparently small, but which displease the consumer, is a procedure which pays, even if the expense of rectifying them seems out of proportion to the amount of money involved. But when manufacturers find out that poor goods evoke complaint, there will be an improvement in their products. The same plan applies to the adjustment of annoying losses and damages incident to the transportation of goods. The placing of claims for damages against transportation companies often appears to be a waste of effort, but a multiplication of claims against such companies is a wonderful incentive against carelessness. Every case of this kind should receive attention from the merchant as a matter of principle, and it will pay in the long run.

The field of discussion involving all the points in buying and selling is one which is well nigh inexhaustible. There is one, however, which will always be open for discussion. It is that regarding the best methods of getting money from the person who has purchased goods, and promises to pay for them in the always indefinite future. It is well known that the purchase of drugs is more of an incident in the lives of most people than it is an every-day occurrence. Sickness usually means a cessation of a man's

productive power, and in many instances the druggist is asked to wait until the power of production can be resumed, but this period with our people of limited means for no means at all is one in which the demands of the butcher, baker and the man in the lighting business are found to have preference. A well man can do without drugs, but he can have no quarrel with the men of bread and meat. In consequence, the man of drugs is usually compelled to wait. The man who has to do a credit business finds that his labor in doing business is only half accomplished when he exchanges merchandise for promises. In fact, he is just beginning his real labors in many instances. Dunning may possibly drive away a customer who might possibly pay in his own good time unasked. But, considering the question from all its aspects, the best plan is to educate the public into the habit of being asked to pay when money is due. The "monthly statement" should fulfill its mission every thirty days, and the foot note, if one is used, should be couched in the least offensive language, but at the same time should convince the recipient that the sender means "business," and that the successful conduct of his business depends upon receiving payment for the goods he sells. This plan soon results in an identification of the "can't pay" and "won't pay" classes, and the earlier this knowledge is acquired the more benefit it is to the dealer.

DECEPTIVE ADVERTISING.

The trite saying of Abraham Lincoln relative to fooling people has been applied so generally to all methods of doing business that there is good reason to suspect that an appropriate application of the idea might be made to the business of advertising. P. T. Barnum is usually given the credit of being the ablest individual who ever fooled all the people part of the time, but his statement that people liked to be humbugged has misled many people, who have endeavored to do business upon this principle; for, in spite of his apparently deceptive and exaggerated advertising, no one could ever accuse Barnum of traveling with a poor show, or of not having the best show upon the road. But these latter points have been overlooked by many of his would-be imitators. As regards that portion of the people who are susceptible of being fooled all the time, it is believed that the class is diminishing in numbers, even if the market for gold bricks, green goods and free prescriptions does show a firm tendency. It is not surprising, when the various schemes now in vogue for grasping fortune are considered, that the business of advertising should be carried to an extreme, so far as correctness of statement is concerned. Each violation of truth and propriety, as it received the sanction of those who were being fooled part of the time, seemed to call for increased competition in this line, until now nearly everybody either sells at or below cost, and published statements regarding "bargains" and "slaughter sales" are regarded as a redundancy of words whose greatest, and perhaps only, effect is produced by the colors and skill of the sign painter or printer who fashions them. One thing is sure, the general public has lost nearly all trace of the definite meaning of such expressions, and now regards

them with indifference and quite often with a contempt which has resulted from too great familiarity.

This trend in advertising tactics may be regarded as the swing of a pendulum, which must necessarily be swung just as far in an opposite direction, and it is now quite noticeable that the George Washington sort of man is soon to have an inning in the game of advertising. He has pulled Truth from the bottom of her well, and now asks the public to gaze upon her as she appears in his advertisement. He is going to be successful, too. A great deal of the credit for this new style in advertising is due to the professional writers of advertisements. They have recognized the fact that the public likes a change, and what could be more novel than a strictly truthful advertisement? The ordinary citizen who has been reading for years of impossible bargains and deliberately saying about advertisers what the psalmist said in his haste about all men, now finds relief in both reading the advertisement of the truthful man, and then patronizing him. He is beginning to believe that the man who advertises an immense stock of goods and is "just out" when some staple article is wanted, is a fraud. The man who "cuts prices in two" is losing in popularity since the advent of the truthful man, as people are beginning to believe that prices which can stand such treatment must have been a gross injustice to buyers who purchased before the reduction was made.

The man who advertises, and then lives up to the statements in his advertisement, is uniformly successful, and he is the man who offers testimony that advertising pays. He knows that overdrawn statements and lying advertisements benefit his competitors, and he is too wise to spend his money advertising other people. He knows that it takes dollars to overcome the disadvantage of having displeased customers, and that his statements in print should come much nearer the truth than his casual remarks to people who enter his store. An oral advertisement of the latter sort takes its tone from the voice which utters it, while that in cold type must be of a character to stand the interpretation which a hundred different readers may put upon it. The public which reads an advertisement which bears an external evidence of truth is much in the same mind as Mopsa in "Winter's Tale," who says, "I love a ballad in print, a falth; for then we are sure they are true."

SOME GOOD ADS.

There is a retail drug firm at Belle Plaine, Minn., which believes in keeping the public awake on the subject of the side lines which they handle. This is done by running attractive advertisements in the local newspapers and changing them often. These "ads" are set so that it does not require a big effort to read them, and the matter is of a nature that really interests. We present three samples, which give an idea of the method and style adopted by this enterprising firm.

PAPER

was invented
by the Chinese

170 B. C.

Since then the styles and quality have been greatly changed, so much so that the first paper made would hardly do nowadays.

We have just received a lot of fine writing paper, in the latest shades and colors, that will please both you and your friends, as it is well made and easy to write on. You need not fear the cost for we are selling the boxes containing 24 sheets of paper and 24 envelopes to match for 35c. We don't think it will last very long at that price, so you had better get some soon.

GEO. SCHOELL & SON,
Druggists,
Belle Plaine, Minn.

Comb Your Hair!

It will make a great difference in your appearance; you doubtless know that.

But do you know that we have a lot of new, large size nickel-back combs that we are selling for ten cents each?

Come in and see them, and you will surely say that you never saw so good a comb offered for so little money.

GEO. SCHOELL & SON,
Druggists,
Belle Plaine, Minn.

Never Borrow a Tooth Brush

for we have a large stock of tooth brushes at all prices. The selection is good, and if you

Buy One

and use it, you will find it will give you good satisfaction and improve your appearance.

Druggists,
Belle Plaine, Minn.

DRUG POETRY.

The reading public has been laughing considerably of late over a poetical effusion which appeared in the columns of Puck, in which the habit of seclusion which afflicts the druggist when engaged in filling prescriptions is derided in a rather humorous manner. It has remained for Mr. E. E. Stanbro, a clerk in Smither's drug store, Buffalo, N. Y., to make a suitable reply, which appeared in the columns of the Buffalo News of January 17. We give both poems below.

Lines to a Druggist.

O, man of mystery and mysteries!
Why hide thyself behind the fixtures,
Why scribbling up those horrid messes
That cure our bodily distresses?
Thy owl-like look defies description,
When reading o'er each new prescription;
Eh, mortars filled with sticky masses,
Of all thy manifold deception.

Bring out the bottles, tubes and glasses,
And mortars filled with sticky masses,
And let us view the slow compounding
Of drugs with Latin names high sounding.

Learn why it takes an hour to make
them—
To measure, weigh, and stir and shake
them.
And know, by sight grown comprehension,
Why Aqua Pura's so expensive.

Thou needst not scowl and glare terrific
When mixing up a soporific;
Nor make you art seem half historic,
In adding squills to paregoric.

Then hide no more behind the grating,
While we grow old with anxious waiting,
But let us see what means this Sanscrit,
Of which thou makest careful transcript.

Mix not our physic in seclusion—
We're not misled by such delusion—
But rather let us watch the making,
And know what is the stuff we're taking.
—Puck.

The Druggist's Side of It.

Since the reason you would know
Why the druggists always go
Out of sight with your prescription,
I will try to give description.

Listen as I sing a ditty
Of a druggist in our city,
By the name of Henry Hank
With a drug store near the bank.

Henry's store was quite a wonder,
Full of things of all kinds;
But, for just prescription work,
Swore he'd never hire a clerk.

Had a boy attend the door,
Wash the windows, scrub the floor;
Henry waited on the trade,
Man and woman, child and maid.

With prescriptions 'twas his wont
To compound them out in front.
No concealment in his place—
"Ain't afraid to show my face."

One day to this place of drugs
Came his friend, old Silas Scruggs,
With a formula for cough,
Wanted it put up "right off."

Then began a conversation
Of a somewhat long duration
On the weather—poor Silas,
While the drugs were on the mix.

Henry got off a good joke,
Scruggs' ribs did gaily poke;
Stopped a postage stamp to lick,
Came back with the arsenic.

Then in came a pretty girl—
Henry left things with a whirl.
She would but a minute linger—
Wanted salve for a sore finger.

Next Scruggs must a story tell,
And it's true he told it well.
Henry laughed and held his side,
Laughed, and—put in bichloride.

With the medicine and cough
Scruggs quite happy wandered off.
"Saw it put up—knew 'twas right!"
Took a dose and died that night.

In six feet of earth they planted
Scruggs, on ground that's surely haunted.
Widow got a good insurance,
Henry's life is now in durance.

For the people wrathly rose,
Said, "One druggist we'll endorse!"
Put poor Henry in a cell,
Where he waits electric hell.

Think our druggist was to blame?
'Twas a man of Scruggs by name;
He would talk to the dispenser,
And his poor soul has gone hence, sir.

I might spin this out much longer,
But I couldn't make it stronger,
And this ditty, quite extensive,
Shows why "water's so expensive."

Simple drugs, like soda water,
(With frumenti for a quarter),
We dispense in open places,
Where you see the clerks' bright faces.

L'ENVOI.

Back behind the case you've cursed,
Works a man in drugs well versed;
Working hard and silently,
Thus insuring accuracy;
Think not this a "jame confession—
Mixing drugs is my profession."
Buffalo, Jan. 15, 1894. S. E. E.

PATENTS ON ADVERTISING SCHEMES.

It usually requires ideas before a thing can be patented in the United States, but the Patent Office has recently decided that ideas themselves are not proper subjects for a patent. The case which called forth this decision was one in which the applicant claimed to have invented a plan to induce the public to read advertisements in the newspapers, the operation of which was as follows: Numbered pictures are issued with each copy of the paper and the advertiser prints in connection with his advertisement an offer to give away some article of his stock upon presentation of one of the pictures bearing a certain number. As part of the claim a sample advertisement was presented in which a New York pharmacist offered to give away a family medicine case for a tintograph view of Union Square numbered 349, published with a certain issue of the New York Recorder. It was assumed that the advertisements would all be read by purchasers of the paper in order to see whether any advertiser made an offer for the picture bearing the particular number issued to them with their paper. The commissioner in rendering his decision asked: "Is this series of acts an art, such as is intended to be protected and its growth promoted by the patent law? In addition to issuing the numbered pictures and publishing an offer of an article from the advertiser's stock in return for the picture bearing a certain number, the plan implies a lawful method of choosing that number and fulfilling the offer; otherwise the reader is induced to scan the advertisements by a false pretense. In the newspaper filed in the case the offers are for a picture issued the day before and bearing a particular number, and it is to be noted that the selection is thus made after that picture had fallen into the hands of some one who may be known to the advertiser; but if this were not so, what method can be suggested consistent with fairness and good morals of choosing the number of the picture whose holder is to receive the gift? Somebody must choose it, either by favoritism or by caprice or lot. This omitted step in the process savors of unlawfulness. Again, if this process is practiced by one taking the prescribed steps in the order mentioned, the process will not produce any physical effect. A patentable process

must accomplish some change in the character or condition of material objects; hence, a plan or theory of action which, if carried into practice, could produce no physical results proceeding direct from the operation of the theory or plan itself, is not an art within the meaning of the patent law."

WAS IT ALL FOR MEDICINE?

That eminently sober and conservative paper, the Springfield (Mass.) Republican, has recently investigated the workings of the "no-license" liquor law, which is in force in portions of the state where the prohibition sentiment prevails. The showing is one which is not very favorable for the drug trade, but a different result could hardly have been expected from such a law, which seems to offer every inducement possible for lying and subterfuge.

Sections 2 and 3 of the act read as follows:

Sales of intoxicating liquor of any kind by retail druggists and apothecaries for medicinal, mechanical or chemical purposes shall be made only upon the certificate of the purchaser, which certificate shall state the use for which the same is wanted, and shall be immediately canceled at the time of such sale in such manner as to show the date of cancellation.

A book shall be kept by every retail druggist and apothecary, in which he shall enter at the time of every such sale the date thereof, the name of the purchaser, who shall also sign his name in said book as part of said entry. The kind, quantity and price of said liquor, the purpose for which sold and the residence by street and number, if there be such of said purchaser, and if sale is also made upon the prescription of a physician, the book shall also contain the name of the physician and state the use for which said liquor is prescribed and the quantity to be used for such purpose, and shall be canceled in the manner before provided with reference to certificates.

No sales can legally be made on Sunday save on a physician's prescription. Of course false or fraudulent certificates are punishable under this act, the extent of the fine being \$10. A druggist, for violating the act, may also be prosecuted and punished, but these penalties, it seems, are seldom or never enforced, for convictions are very difficult to secure. An unprincipled druggist may conduct a liquor business on an extensive scale and have nothing to fear.

The reading of the law shows that all a person has to do to obtain liquor at a druggist's is to fill out a blank certifying that he or she wants the article for medicinal, mechanical or chemical purposes, and then enter a signature. No oath is taken during this procedure.

Westfield, Mass., voted no-license last March, and the decree went into effect May 1, 1893. The druggists of that town at once became more interested than ever before in chapter 431 of the statutes of Massachusetts, which is an act to limit and regulate the sale of intoxicating liquors by retail druggists and apothecaries. A druggist's license costs but \$1, the idea underlying that insignificant sum being to place the druggist on his honor, but statistics covering the sales of intoxicating liquors by six drug stores in Westfield for a period of thirty-one days have been given by a correspondent of the paper, which shows how the scheme really works.

Westfield is a town of 10,000 inhabitants and is a typical New England town of the better class, but during the thirty-one days noted six druggists sold 7,076

pints of liquor, the sales aggregating 5,928. Of these sales 5,581, aggregating 6,772 pints, were sold for "medicinal" purposes, the average daily sales of all the stores being 206, with an average number of pints amounting to 250. The statistics further throw considerable light upon the medicinal qualities of liquors, as it is noted that 43 per cent of the sales were of beer; whiskey and gin ranking next in order. The clinical records appearing upon the druggists' books during this time would lead one to the conclusion that alcohol is a panacea for all the ills that flesh is heir to, and that the best effects are obtained by liberal doses. One "sick" individual bought in twenty-three days eighteen pints of gin, eight pints of beer, six and a half pints of rum and five and a half pints of whiskey. Another man bought thirty-one pints of intoxicating liquor for medicinal purposes on two successive days. One man carried a rubber stamp to save the trouble of writing his name on the drug store certificate. It is also noted that "Jack Dempsey," "J. J. Corbett," "Tom Ato," "Lizzie Borden," "Head Ake" and other well known characters are steady customers at the Westfield drug stores. The Springfield Republican is now of the opinion that the law should be amended immediately.

GERMAN ROSE CULTURE.

In describing the cultivation of roses and distillation of the oil at Leipzig and Miltitz, Saxony, by Schimmel & Co., Prof. F. A. Fluckiger, in an article appearing in a recent publication by that firm, says:

"At first Centifolia roses, from the neighborhood of Leipzig, were employed, but in 1888 the firm procured a considerable number of rosebushes from Bulgaria, which increased rapidly under suitable treatment. The roses from Kasanlik flourish excellently in the porous, chalky, loamy soil of the Saxon plain, in which subterranean water generally occurs at not too great a depth, provided that a liberal supply of moisture be not wanting during the flowering period at the end of June and the commencement of July. A widely ramified drainage system moreover is already in working order to insure a supply of water to the deep-striking roots of the plants. The roses have been multiplied by means of cuttings taken from shoots with two eyes, and which either have already flowered or are capable of doing so.

"The Bulgarian rose-shrub is furnished pretty freely with not very decidedly backward-curved prickles. The smooth, lanceolate-ovate, three-paired pinnate leaves and the terminal leaflet are pure green. The calyx, also, is smooth, or very slightly hairy. Many clusters have about twenty-seven flowers, grouped together so as to almost resemble an umbel. The diameter of a rose in full bloom does not exceed more than 7 centimeters (about 2.45 inches), and, although the flower is a double one, it nevertheless contains a considerable number of stamens with large, yellow anthers. The outside leaves of the corolla are frequently almost white, the inner ones reddening toward the center of the flower, in the most favorable case they are almost entirely pure rose-colored. Experience teaches that over-mature roses, showing a more or less clearly-defined violet tinge, contain less oil than others. This applies in

a much greater degree still to the white, or only slightly pink-tinted flowers, which are often almost odorless, and, besides, betray themselves as malformations by their starved appearance. Too dry weather favors this backwardness and the falling off of such flowers.

"The Bulgarian rose-shrub possesses the advantage of being a very free-flowering plant, and it is a matter of some importance that the flowers can be rapidly and smoothly detached from the petiole, immediately below the calyx, with surprising ease. The strong annual shoots of the shrubs grow over three and a quarter feet in height; the plants now in bearing are mostly only half the height. After the flowering the old wood is pruned down; for the rest, time must show which is the best method of cultivation.

"By giving it the name of Rosa Damascena Miller the attempt to trace the Bulgarian rose from a known uncultivated variety has been abandoned, for the Damask rose is a product of horticulture, although it may be systematically classified in some way or another, probably, with the nearest approach to accuracy, as a hybrid of the Rosa gallica and Rosa canina. In the course of time the Kasanlik rose has become a distinct variety.

"At the present time about eighty-five acres of this rose are under cultivation at Miltitz. During a few weeks at the end of June and the beginning of July this area yields daily from five to twenty tons of flowers. After a sufficient fall of rain it is even possible to harvest a still larger quantity of fine, matured roses. Their condition depends greatly upon the weather. From 115 to 160 well developed roses go to the pound, but it requires as many as 275 withered ones to make up that weight, and even then they are not comparable to the fine flowers in respect of odor. Want of rain and scorching heat have thus far shown themselves the principal drawbacks of the culture. Nevertheless, the yield of roses appears to be equal to that in Bulgaria, which is about 48 cwt. per acre. Besides roses, the cultivation of mignonette, violets, peppermint, tarragon, angelica and leuciscum has already been commenced at Miltitz.

"It very soon proved unavoidable to carry out the distillation of the roses in the immediate neighborhood of the plantations, and to restrict these to the parts surrounding the factory. When the conveyance of the roses to the still took several hours, or even a whole night or day, they spoiled, and produced ethylic alcohol instead of, or together with, rose oil; the worthless stearoptene suffered no diminution. At present about five miles southwest of Leipzig, immediately adjoining Miltitz station, there rises, under a light roof glittering from afar, a distillery, systematically supplied with the best modern appliances. On a sunny day the simple, almost elegant, contours of the boiler-house carry away the thoughts of the visitor, whose attention is not riveted on the distillation process, to the lovely landscapes of Tuscany, with their noble buildings (devoted, it is true, to other objects), and dim reminiscences of solemn domes, such as those of Pisa, involuntarily force themselves upon his mind.

Every forenoon the freshly gathered roses now reach their place of destination within a quarter of an hour at the most, traversing that short distance not tightly packed, but distributed in baskets

of moderate size. Without delay they are carried, through a man-hole over one and a half feet in diameter, into the powerful copper stills, of which the conical bodies are capable of carrying each one and a half tons of roses, besides the water required for distillation.

"The rosebushes only have been imported from the far-off hills of the southern Balkans, not the mode of treatment which is practiced there. In Miltitz the supply of heat, its distribution and the time of its action have been made to suit the nature of the otto of rose. Any alterations, therefore, to which it might be liable are at least reduced to a minimum without causing any delay in the distillation. Moreover, on the basis of the experience gained, a threefold process of treatment of the roses has here been evolved. Thus the object may be either to separate the oil or to prepare rose-water; or, lastly, to use a portion of the crop for the manufacture of rose-pomade. The distiller is, therefore, by no means satisfied when he has removed the layer of oil and stearoptene which has collected upon the surface of the distillate. Even the preliminary separation of the oil and the stearoptene is made use of for the purification of the oil.

"It may be taken for granted that about 5,000 pounds of well-developed, fully-matured roses are required to produce one pound of otto; occasionally the yield is a little greater. The liquid part of the otto of rose consists of rhodinol, first investigated in 1881 in the Pharmaceutical Institute of the University of Breslau. Whereas, all other essential oils, so far as they have been investigated, are mixtures of several constituents, no other ingredients have as yet been found in the liquid part of otto of rose. If any should be present (which can hardly be doubted), they certainly form an exceptionally small proportion.

"Perfect cleanliness is the rule in the gigantic still-room, from the four mighty stills that form its principal feature (at least two more could easily find place) down to the smallest accessory utensils. Ventilation diminishes the perceptible odor to such a degree that it is quite comfortable to remain in the well-lighted factory. The slightly yellowish contents of the stills flow into a shallow trough which has been constructed before the factory-gate. It is possible that certain substances contained in the roses, which are not yet clearly known, suffer decomposition during the process of distillation, and that the decoloration of the broth which has slightly acid reaction is an indication of this fact. At any rate, the broth in the trough assumes, in the course of twenty-four hours, a dirty red color, doubtless due to oxidation, and gradually acquires a somewhat harder consistency. In the interests of physiology of plants, it deserves closer investigation.

"The petals of the roses do not possess special receptacles, such as glands or oil ducts, in which drops of the oil or crystals might be seen as in cloves, in the peppermint herb, or in lemons. It would appear, on the contrary, that the very minute proportion of the otto of the rose lodges in the sap of the small epidermis-cells of the upper surface of the petal, though probably only the liquid rhodinol, which alone is the odorous principle, is found there. The other ingredient of the crude otto of rose, i. e., the odorless paraffin or rose-stearoptene, prob-

ably belongs only to the surface of the petal, from which it is detached in the process of distillation, its melting point being 32.5° C., or, perhaps, a little higher. Although under ordinary conditions this stearoptene only volatilizes at a temperature far exceeding that of the still, it is, nevertheless, carried away easily by vapor entering under pressure. It is worth noting that hydrocarbons, probably of the ethane, or paraffin-series here occur in combination with the oxygenated odorous principle, rhodinol. Even the preliminary investigations which have been made here have shown that the rose-stearoptene is by no means a simple body.

"The five calyx-segments of the rose cultivated at Milnitz are not very long, slightly velvety on the inner surface only and sparsely adorned with very minute leafy pinnæ. They carry, especially at the borders, a rather considerable number of hairs, each having a dark-red gland at its apex. The whole of the green parts of the roses, viz.: the receptacle and sepals, constitute about 17 per cent, by weight, of a fully-developed, freshly-gathered rose not moistened by rain. The contents of the glands of the leafy calyx-segments are quite devoid of the rose-odor, even large quantities of those green parts are almost without any odor whatever, and are neither greasy nor sticky to the touch. Where the preparation of otto of rose or of rose-water is aimed at there would be no object in separating them from the petals. Rose-water may be prepared up to a strength representing six times the weight of roses, octuple concentration, however, is hardly feasible, for at that strength the separation of oil or of stearoptene might take place through the action of cold.

"The oil, nevertheless, does not pass through the giant stills and receivers without being chemically affected. It is certain that the odor of the rose is not improved by the process. To the southern French, probably, we owe a mode of treatment which is intended to preserve undiminished the finest odor by first bringing the roses into close contact with fat. For this purpose it is necessary to pull off the whole calices in order to get rid of their undesirable green coloring-matter (chlorophyll). This is not such an easy work in the gathering, especially because the anthers, which are numerous even in the double roses of Kasanlik or Milnitz, must be retained. Only perfect roses are selected for this treatment. By pulling off the green parts the petals, including the anthers, separate into a loose heap and are, therefore, very easily penetrated by the fat, which has been liquified by gentle heat, by beating them up with it for a few hours. The fat used for this purpose is purified with the minutest care and prepared by processes devised from experience gained at the works. The pomade (to retain the convenient French expression) is carried from the copper stirring-vessels into centrifugal machines. These very rapidly separate the liquid fat, which runs into the "Montejus," and is carried by them once more to a fresh supply of the petals. The fullest possible saturation of the fat with the rose-odor can only be attained after due repetition of this process. The pomade, when ready, owes its pretty yellow color to the anthers. The red coloring matter of the petals is not incorporated by the fat.

"Within the pomade the unaltered perfume is excellently retained. It may be kept for a long time and transported at will. In order to make the scent available for perfumes the pomade needs only to be extracted by pure alcohol under gentle heat. This "Extrait," which is possessed of the finest rose-odor, is no doubt a French invention; but the pomades, or perfumed fatty oils, were already among the ancients a much-prized toilet ingredient, which counted its votaries not only among the ladies and exquisites of the period, but also among the leading statesmen of Rome. "Extraits," however, remained inaccessible even during the period of the most extreme effeminacy in the *thermae* of Titus, Caracalla or Diocletian, as the art of distillation had not, at that time, progressed to the extent of preparing alcohol."

FOREIGN DYEWOODS.

The State Department lately instituted an inquiry upon the dye-woods industries in various consular districts, and several reports bearing upon the subject are published in the March volume of consular reports, from which we make the following extracts:

"Hayti exported logwood during the ten years ending June 30, 1892, amounting to \$13,123,642.65, of which amount the United States received \$2,477,697.69. There has been a notable decrease in the export during these years, the figures showing a gradual decline from 152,288,713 pounds in 1883 to 29,766,320 pounds in 1892.

"The forests which produce these trees in the vicinity of roads that are available for transporting the logwood to the seaport are being rapidly denuded and partially destroyed. So eager are the people to sell their logwood that they allow no time for the stumps and roots to mature, which is from eight to twelve years, but cut down the sprouts and saplings, because they can find speculators to purchase them. Should affairs continue in this state Hayti will cease in fifteen years to count logwood among her exports.

There still exists throughout this country an immense quantity of logwood, there being numerous virgin forests of this dyewood; but as they are far from the public roads, it cannot be transported to a distant market. As railroads will shortly be built, concessions having already been granted to several individuals who, according to contract, are obliged to commence work this year and complete it within a specified period, this logwood can then be conveyed to the seaport, and its exportation vastly increased. Should the people, while occupying new fields, allow the old roots and stumps to grow to maturity, then Hayti will be able to furnish to the industrial world as much logwood in the future as she has in the past.

Mexico.

Nature has supplied Mexico with an abundance of woods. Many pages would be required to describe all the varieties. Those that have been known and are already utilized embrace a list of 400. Fifteen of these are used for dyestuffs. One tree, called purplewood, in its natural state is as brilliant as the famous Tyrian dye. The wood looks as if it had been dyed with perfect material, yet that is the way it grows. Another, the species known as "Palo-Moral," is also very valuable for dyeing fast colors. It is found in

considerable quantities in the States of Tamaulipas and Nuevo Leon. However, the principal and best known dyewoods are campeachy (logwood), Brazil wood and fustic (palo-amarillo). The dyewoods exist mainly and extensively in the states of Campeachy, Veracruz, Tabasco, Yucatan, Chiapas, Oaxaca, Guerrero and Tamaulipas. In the states of Sinaloa, Jalisco, Colima, Nuevo Leon and Michoacan there is quite an abundance, but the forests have not as yet been much explored. We can thus infer that dyewoods grow in profusion along the coast of the republic and sparingly in the interior.

The business of collecting and exporting these woods is very lucrative. Several German and a few English firms have been in the business for a number of years in the states of Campeachy, Yucatan, Tabasco and Veracruz, and have made considerable money. The Germans and French were the first to develop the business of exporting these woods, but England, for the last few years, has almost monopolized it. The principal markets are England, Germany, the United States, France, Spain and Russia (recently).

As the exportations to the United States are on the decrease, and very few Americans are engaged in the exportation of these woods, it is to be asserted that this industry, in connection with the choice cabinet woods so profusely growing in the above states, together with some of the present facilities for transportation, offers exceptional inducements for the employment of American capital and enterprise.

The wood commonly known as "palo-moral," or "palo-amarillo," is very important on account of its abundance and the facilities for obtaining it. It abounds along the Gulf coast, Guerrero and Michoacan; but that which is produced in Isla del Carmen (Island of Carmen), Tamaulipas (Tampico) and Veracruz (Tuxpan) is more valuable, having a greater proportion of dyeing qualities. It is exploited like Campeachy and Brazil woods. Different sized logs are cut and the bark is separated before both (the bark and wood) are disposed of for market. Its coloring matter in the Mexican market is utilized principally for staining cotton, silk, and more particularly wool, with a beautiful yellow. In combination with campeachy, indigo and salts of copper and iron, various other colors are produced. For many years it has been exported to Germany, France and England. Its exportation running as high as 9,000,000 kilograms a year.

Although the forests of these and other woods cover almost all the coasts of the republic, and are still very extensive, it has been thought that the random and careless manner of cutting down the trees would, in time, destroy them; hence the department of encouragement has issued a circular to prevent the destruction of this immense source of wealth. The government also, with the same object, has placed an export duty on cabinet and construction woods of \$1.50 per cubic meter, and on campeachy of \$1.50 and palo-moral of 75 cents per ton of 1,000 kilograms. But it is the opinion of Mr. L. Glezias, in the department of Fomento, that, notwithstanding the wanton manner of the natives in cutting the trees, this Mexican resource is almost inexhaustible. Vegetation is so prolific along the coast and tropical section

of the country that cutting trees and clearing the ground stimulates the growth of its products, and immediately after trees are felled a new supply of young trees is ready to substitute them.

Colombia.

The United States consul at Panama, in reporting upon the dyewoods of Colombia, says: "There are great quantities of fustic timber here and some divi-divi. No logwood has as yet been discovered, although it is probable that the tree will be found in the yet unexplored timbered wilderness and vastness of the department of Panama. No fustic is sent to the United States from this port, because the rates over the Panama railroad from this place to Colon do not justify it.

"Fustic is cut in short pieces, which, as a rule, are very crooked, thus making close packing an utter impossibility. The shipper would have to pay for two or three tons (space) when in reality he would send only one ton in weight.

"The dyewood history is, so far as this place is concerned, just about one year old, and there are no official statistics in regard to it. However, the information I have gathered is quite official, since I have it from the one solitary shipper of fustic from this place.

"All the fustic is cut on government lands, hence the material costs nothing. How long the government will allow the promiscuous and free cutting no one can tell. The labor is exceedingly cheap, and it is safe to say that one ton of fustic, ready to be put on board ship, does not cost \$5. Of course there are no sawmills; the trees are cut along waterways and floated down in the log to a handy place for shipment aboard ship or train, and there it is cut into suitable lengths.

"The price of fustic is so very low in the United States that it is shipped to Liverpool and Havre by the way of Cape Horn on vessels flying anything but the American flag. The ports on the Pacific coast, all the way from San Jose de Guatemala to the Horn, have vessels of European nationalities in their harbors, but no American vessels. Those vessels come loaded down to the gunwales with goods and return with all they can pick up, and this is the way the fustic leaves the department of Panama on the Pacific coast.

"Last year the one solitary shipper of fustic sent to Liverpool and Havre 250 tons of 2,000 pounds. This year he will send less, because the prices are down in Liverpool—one-half of what they were last year." From 15 per ton it has gone down to 12½. In Havre it is worth 8.75 francs per 200 pounds—somewhat higher than in Liverpool.

"The price of the freight from here to the places where the dye is used seems to be the main factor in the matter of value. Cannot some of our chemists devise means by which the extract of fustic—the stuff needed for dyeing—might be separated from the wood at the place where the dyewood grows, thus doing away with the main factor of value?"

Jamaica.

Logwood is the natural growth of the lowlands of the island, and, as a dye stuff, is intimately associated with the textile industries of all manufacturing countries.

During the past ten years, owing to the great demand and increase in price, the logwood industry of this island has

assumed proportions of considerable magnitude, there having been exported during this period 818,358 tons, of the value of \$13,172,338.13. Of this amount there was exported to the United States 138,322 tons, valued at \$2,262,859.87; to the United Kingdom, 443,835 tons, of the value of \$7,039,271.27, and to other countries, 236,199 tons, of the value of \$3,849,204.99. The United States have largely increased their imports. For the fiscal year ending September 30, 1883, there were only 311 tons of the value of \$4,482.81, while for the past fiscal year they amounted to 21,594 tons, of the value of \$391,944.96.

The price of logwood has ruled here for the past ten years from \$15 to \$25 per ton, and has recently risen to \$7.50 per ton. On account of the high price offered, an active trade has been had not only in the straight wood, but in the roots. During this period a large quantity has been brought from the interior of the island, and since the extension of the Jamaica railway a new source of supply has been opened up which was hitherto inaccessible. The exports of roots began about fifteen years ago, and must be made up from the fact that they have been made up from the cuttings of one hundred years previous, when only the trunk or straight wood was in demand and exported. In regard to the future of the straight wood or logwood proper, there is very little probability of the supply being decreased. It will continue for many years to come if the present prices prevail, owing to the care now being bestowed upon the cultivation of the wood. When the old roots—the remnants of cuttings of straight wood of former years—are practically exhausted, the relative quantity of straight wood and roots will probably remain constant in the future. The relatively large shipments of the first few years after they came into use were due to the fact that large quantities were in the ground, having been left there as of no commercial value. The old roots of trees, cut fifteen or more years ago, are now in most parts of the island practically exhausted. A logwood tree that would yield a ton of straight wood would not have over 3 or 4 cwt. of roots.

Fustic. Fustic is a mountainous wood, and, therefore, more difficult of transportation than logwood. The exportation of fustic from this island for the past ten years amounted to 23,318 tons, of the value of \$245,592.25. Of this amount the United States took 3,133 tons, of the value of \$45,266.58; the United Kingdom, 15,650 tons, valued at \$234,656.80; and other countries, 4,535 tons, of the value of \$75,668.81. In 1883 the United States imported 133 tons, of the value of \$1,954.87; the past fiscal year 811 tons, of the value of \$13,316.33.

The price has ruled for the past ten years from \$12.50 to \$15 per ton. It costs as much to market it as logwood, and there is now more than \$10 difference in the prices of the two woods. There seems to be but little demand here for fustic, and the price is so low that but little interest is manifested in this industry.

There is no likelihood that the forests producing this wood will be destroyed, and exporters for years to come will be able to fill any reasonable demand that is made for it.

There is in process of erection in Spanish Town, in this island, a plant for the extraction of dye from these woods; but it is not believed that, even if successfully

operated, it will diminish the exportation of the dyewoods.

FROM AN ENGLISH STANDPOINT.

"Much has lately been said about the danger in South America from foreign competition to British trade. This danger has been greatly magnified. It is true that, glanced at superficially, one would think that the ubiquitous and active Germans were certainly getting ahead of us, but the English have, beyond doubt, the most influential position in South America. In their hands are the banks, the railways, and the higher commerce. Germans only seriously rival us in detailed commerce and in clerical departments. The French are mostly occupied with special produce of their own country, and as for the Americans, their influence and competition are scarcely appreciable. Englishmen will have only themselves to blame if they are deprived of the advantageous position which they have held so long and still occupy, and it will not be so easy to defeat them as some writers seem to imagine."—South American Trade Journal, London.

TRADE MARK INFRINGEMENT.

In the recent case of Kerry et al. vs. Toupin, Judge Aldrich, sitting in the United States Court at Boston, rendered a decree granting a perpetual injunction against the defendant on the ground that he had infringed on plaintiff's rights in the trade name, "Syrup of Red Spruce Gum," under the provisions of the International Convention for the Protection of Industrial Property. The injunction restrains the defendant from dealing in an artificial medicinal preparation under the name of "Syrup of Red Spruce Gum," or any translation thereof. The case is said to be the first finally decided in which the international convention has been construed.

A street car in Plzeburg, fitted with steel ball bearings as an experiment, has been run for several months without being oiled since it was first put in service.

One ton of canal coal when distilled in gas retorts produces besides the gas, twelve gallons of coal tar, which produces a pound of benzine, a pound of toluene, a pound and a half of phenol, six pounds of naphthalene, a small quantity of xylene and a half pound of anthracene for dyeing purposes. Of the colors obtained there are said to be sixteen distinct yellow, twelve orange, thirty red, fifteen blue, seven green, and nine violet colors, also a number of browns and an almost endless number of blendings of these shades.

The great progress in botany, says the American Naturalist, is shown by the fact that 400 years before Christ, Hipparchus was able to enumerate only 231 species. Even two centuries ago only 5,396 species as catalogued by Bauhin, were known to the botanist, and a century afterward, in 1771, the great Linnaeus was able to recount but 8,551. At the present time, little more than a century later, there are known to botanists no less than 173,706 distinct species, 105,231 phanerogams and 68,475 cryptogams, of which latter 2,819 are ferns, 4,600 mosses, 5,600 lichens, 23,600 fungi and 12,178 algae.

TRADE NOTES.

William L. Strauss, of W. L. Strauss & Co., importers of drug sundries, etc., 27 Warren street, New York, sails for Europe April 10 on his annual trip, hunting for novelties of merit.

Raymond & Co., manufacturers of Raymond's Pectoral Plasters, 62 Carroll street, Brooklyn, N. Y., say they are receiving answers to their advertisement on page 7 at the rate of about twenty a day. They want fifty per day, and will do as they agree about the plasters. Why don't you get the \$1.50 they offer you. You can get it in cash in a very few days if you are a good salesman.

As an evidence that times are improving, Mead & Co., manufacturers of drug mills, Detroit, Mich., state that they have orders for mills from all parts of the country, and from the number of inquiries they are receiving they expect a good business the coming season. They have recently shipped four of their No. 2 mills to Des Moines, Ia.; one No. 1 to Chicago, and a No. 2 to San Francisco, California.

Judges at all the great expositions have thought enough of the licorice manufactured by Mellor & Rittenhouse, of Philadelphia, to give it the highest awards. The public thinks enough of it to buy it whenever it is obtainable, and the druggist should be governed by these verdicts in making his purchases. High quality and neatness of package are distinguishing characteristics of the "M. & R." brand.

Attention is directed to the advertisement of E. F. Baker, Chicago, manufacturer of the old and well known Champron sticky fly-paper, which has for its basis parchment paper, claimed to be the most impervious and toughest paper made. The retaining border is also a feature of this paper which gives it a distinct advantage. See prices upon another page in this issue.

Do you expect a rush in the soda water business this summer? If you do not, you are perhaps not preparing for it; and won't have it. If you do expect it, you will need something which will clean tumblers effectually and quickly. For this reason you should investigate Rowe's Automatic Tumbler washers, with brush attachment. Send to L. L. Rowe, 16 Howard street, Boston, for full description and prices.

The Histological Microscopes manufactured by Joseph Zentmayer, 209 South Eleventh street, Philadelphia, are not only used extensively in this country, but many of them are sold in Europe every year. They have certain advantages which make them a valuable instrument for the microscopist, and intending purchasers should send for the catalogue describing them before buying elsewhere.

The Eureka Chemical Co. are making some terms on a good seller which should attract the attention of the retail drug trade. They offer one dozen Pennyroyal Wafers (by express, charges prepaid) at the regular price of \$8 per dozen. They give one year's time in which to pay for them. Plenty of advertising matter is furnished with the goods. Order direct of the Eureka Chemical Co., 10 and 12 Michigan avenue, Detroit, Mich.

Where 50 to 100 per cent can be saved by knowing how, it is a good idea to find out how it is done. The Merz Capsule Co., of Detroit, Mich., will furnish this information to all who will ask for it. It is done by using their Empty Elastic Capsules and filling apparatus in compounding prescriptions, but their catalogue tells all about it and gives some figures which are quite interesting to the druggist who is inclined to combine economy with convenience.

Smith's "True Fruit" pepsin chewing gum is popular with the public, because it possesses considerable medicinal value and retains its flavor for a long time. "Kof-Kure" gum is also popular on account of its efficacy in coughs, colds and hoarseness. The retail trade favors these gums on account of the attractive manner in which they are put up. The fancy counter box with alarm bell is quite a novelty, and aids very much in attracting attention to the goods. Write J. Hungerford Smith Co., Rochester, N. Y., for prices.

You can dispense powders in "Konseals" as quickly as you can fold them in powder papers, and as they are claimed to be of twice the capacity and half the diameter of any cachet or wafer on the market, the physician and his patients greatly prefer them. Samples of Konseals, and description of the apparatus used in dispensing them will be sent free upon application to the American agents, J. M. Grosvenor & Co., 105 Milk street, Boston. They will also send you sample of their advertising to the medical profession. This advertising never fails to interest the physician.

If you want to know how to compound some of the latest soda water drinks that are now stimulating public taste, and creating a demand for themselves; if you desire to know all about fancy syrups, crushed fruits, ice creams, ices, soda and mineral waters, write to W. A. Bonham, 201, New Era building, Chicago, for prices and information regarding Bonham's Soda Guide, which is full of hints and suggestions relative to manufacturing and dispensing, and formulas for compounding the various popular drinks.

The Ash Soda Fountain Co., of Chicago, have embodied several improvements in the construction of their apparatus which those interested in the soda water business will regard with much favor. The arrangement of their horizontal syrup jars and spring appliance which holds them when partially pulled out for filling or cleaning is certainly unique, and does away with a nuisance which has long bothered the dispenser. Write for detailed description of their apparatus and judge of its merits for yourself.

Mrs. Gervaise Graham has removed from 1355 to 124 Michigan avenue, Chicago. In sending notice of this removal, Mrs. Graham adds: "Notwithstanding business depression, our January and February sales were double those of corresponding months last year. I now give jobbers a discount of ten per cent and five per cent for cash in 30 days. Madam Patti has just ordered a dozen of my Cucumber and Elder Flower Cream and two dozen of my dip Rouge, which she desires to take to her residence in Wales."

Elegance is one of the prime requisites around the soda fountain, and the public, while it may tolerate slipshod methods, prefers to trade where everything is conducted in first-class style. The Bradley Ice Cream Cabinets are great helps in creating this latter impression in the minds of soda water patrons. They can see that ice cream is dispensed from an apparatus which is in keeping with the usual surrounding of the soda counter, and it certainly looks better to serve cream from a cabinet than from a freezer under the counter. Then it is more convenient for the dispenser, and anything of this character is worth investigating. Write for descriptive circular.

INHUMAN TREATMENT DENOUNCED.

Dr. Frank Thatcher, of Fort Worth, Texas, a leading veterinary surgeon and a graduate from one of the largest English colleges, writes under date of March 10 as follows: "After giving Quinn's Ointment a thorough test, I think it my duty to express my candid opinion as to its merits. I have abandoned all other blisters, as Quinn's Ointment is more effective and by all means more humane in its action. Though this statement is not very professional (that is, to recommend patent medicines), I do this hoping that all intelligent persons will take advantage of so valuable a remedy and save many a noble horse the inhuman practice of the firing iron, and likewise the abusive use of strong blisters. I advocate humanity; and in Quinn's Ointment we have something that will relieve any lameness without torture." It will pay all druggists to carry it in stock, and if you desire advertising or will send the names of ten or twelve of your customers who are in the horse-breeding line to Messrs. W. E. Eddy & Co., Whitehall, N. Y., they will forward them, without charge, trial packages.

**HAVE YOU SEEN IT?
Eastern Star Perfume.**

The latest success in the line of popular odors made by Foote & Jenks. It is very delicate and delightfully fragrant, yet its endurance and lasting properties when applied to the handkerchief or clothing is perfectly wonderful.

It is pre-eminently a favorite with ladies, and you know the ladies use most of the perfume. Most druggists have some lady customers who

are members of the order of the "Eastern Star" in whose honor this odor was named. Most gentlemen are fond of perfume—also of ladies—and take very kindly to the "Eastern Star." Order a bottle of your jobber, or send to Foote & Jenks for sample and price list.

Trade tributary to New York City can be supplied by McKesson & Robbins.

The No. 602 Improved Tooth Powder Bottle, manufactured by John M. Maris & Co., Philadelphia, costs \$14.40, less 33 1/3 per cent discount. They hold 2 1/2 ounces liquid, and their construction is such that the public is very likely to want the tooth powder which you put up in them. See description of the bottle in advertisement in this issue, and do a little figuring on an investment in the tooth powder business.

The Ilicorice mass manufactured by MacAndrews & Forbes is recommended especially for pharmaceutical purposes, as it is made from roots gathered in Asia Minor, Syria, Greece and Southern Russia, which are reputed to be particularly rich in glycyrrhizin. Parties using Ilicorice mass in any quantity will do well to write this firm for prices on one of their cases of 50 pounds. Mention the Era.

Ed. Pinaud's perfumes command a good price, and have qualities which make them worth the money. There are lots of people who are looking for quality, and the druggist makes no mistake in placing Pinaud's before them. Send for free samples of Aurora Tulp, Paquita Lily or Acacia de France, and see how quality corresponds with prices. Address Ed. Pinaud, 42 East 14th street, New York.

The Akron-Canton Stone-ware Agency, 25 Lake street, Chicago, makes special wares for chemical laboratories, hospitals, assayers, etc., and guarantee their goods to stand acids and alkalis. They carry jars in stock from one-half pint to thirty gallons, also all kinds of mixing bowls and evaporating pans. Catalogues will be sent upon application, but the kind of goods wanted should be stated when writing.

The well-known firm of Dr. Henry A. Martin & Son terminated on November 5, 1893, by the death of Dr. S. C. Martin. Dr. Francis C. Martin is the only surviving son of the late Dr. H. A. Martin (who introduced vaccination into America in 1870). Dr. Martin attends personally to every detail of the business, and spares no effort nor expense to have his virus the best upon the market. Write to him for prices at Roxbury Station, Boston, Mass.

Fred N. Burt, of Buffalo, N. Y., claims that he has reached the bottom in the production of cheap boxes, labels, etc. for druggists, and has arrived at the top in producing the finest goods in the same line for the same people. This is rather a strong statement, but Mr. Burt will send samples and prices which are quite convincing in support of his claim. Give him a chance to do a little convincing, by sending him an inquiry regarding his goods.

Chambersburg, Pa., March 13, 1882.
S. S. Seely & Co., Bath, N. Y.
Gentlemen: Notwithstanding my aversion to encouraging the sale of proprietary medicines, it is without hesitation that I bear testimony to the almost universal satisfaction that my patrons have experienced from the use of Seely's Liquid Cough, Heave and Distemper Cure. I have sold several gross of it, and recommend it as the only medicine I ever knew that will cure heaves. It has cured many valuable horses in our county.

CHAS. H. CRESSLER, Druggist.

One advantage connected with the sale of the "Pen-niston" combined hot water bag and food warmer, is the fact that it sells nearly as well in summer as in winter. A person rarely has use for a hot water bag in summer, but the "Pen-niston" can be filled with salted ice water, and food for children and invalids can be kept cool and sweet for a long time. Write the Devil Rubber Co., Providence, R. I., if further particulars are desired.

In referring to their distillate of witch hazel, manufactured while the bloom is on the bush, the Connecticut Witch Hazel Co. say that they have every facility for manufacturing a first-class article; they have embarked in the business to stay, and propose to furnish goods that can give satisfaction or be returned at their expense. They invite correspondence for prices and are confident that a trial order will prove the truth of their assertions.

Morrison, Plummer & Co., of Chicago, have recently enlarged their drug sundries department by occupying an adjoining building, which places them in a position to serve their patrons with prompt shipments better than ever before. To show how they also intend to increase their list of business friends, they call attention to a few staple articles in their advertisement in this issue which are worthy the attention of the retail trade.

If you contemplate making any change in the interior arrangement of your store it might be well to consider the respective merits and cheapness of wood, plaster and metal. The two former can usually be figured upon by local artisans, but the matter of metal ceilings and decorations should be referred to Kinnear & Gager, 28 North Fourth street, Columbus, Ohio. Write to them, stating what you want or what you think you want, and they will send you prices.

The past winter has been marked by the prevalence of small-pox in many parts of the country, and the public has had the importance of vaccination brought to their notice in a very forcible manner. The subject of vaccination is one which is always of interest to the drug trade, as the physician usually finds it most convenient to obtain his supplies of virus through the agency of the pharmacist. The subject is, therefore, one upon which the trade should be posted, and there is perhaps no better way to accomplish this than to send to the New England Vaccine Company, 294 Broadway, Chelsea Station, Boston, Mass., for the latest edition of their work on "Variola and Vaccinia," giving a history and description of the disease, with a description of the methods of preparing the virus. It will be sent upon application.

WORLD'S FAIR PICTURES.

Later parts of the Michigan Central's World's Fair Portfolio fully justify the claim made upon the publication of the first number, that it was the best, the finest and the most artistic of popular publications on the White City.

Each part contains sixteen (16) large plates and is sold for only ten cents. If you haven't seen it, the nearest Michigan Central ticket agent will show it to you, or you can write to O. W. Ruggles, G. P. and T. Agent, Chicago.

Flor de Fuller, cigars have proven immensely popular wherever introduced because they have the qualities which all lovers of a mild, delicious cigar most desire. They are sold by the Fuller & Fuller Co., Chicago, at \$5 per thousand, with a discount of \$1 in lots of one thousand and \$2 per thousand in lots of three thousand. Include a few hundred in your next drug order and see if they do not suit your old customers and bring you new ones.

"Forget-me-not," "Drop-of-Dew" and "Horizon Oris" are attractive names, and they have been attached to attractive goods by the Theodore Metcalf Co., of Boston, who use them to designate three of their trade-marked sachet powders. This statement regarding the goods is one which emanates from the general public, who are liberal patrons of the Metcalf Co.'s powders. See list of jobbers in advertisement in this issue who handle these goods.

The city of Peoria, Ill., the birthplace of Clarke's Pure Rye Whiskey, is justly proud of this most popular product of one of its largest distilleries. The public has learned that this whiskey has every good quality that is claimed for it, and whenever a pure alcoholic stimulant is wanted, Clarke's Pure Rye Whiskey is selected. Attention is called to the advertisement of Colburn, Birks & Co., the sole distributors of this whiskey, in another part of the Era.

Every manufacturer of pharmaceutical specialties, whether large or small, is interested in the best methods for advertising them. All these will find something of interest in the catalogue of Roneous & Co., 617-619 West Pratt street, Baltimore, Md., which is full of illustrations showing designs of the novel advertising signs in tin, nickel, cardboard, celluloid, etc., manufactured by them. Parties who have an idea that such methods of advertising are too expensive should get prices from this firm and then modify their views on the expense question.

SPECIAL OFFER.

TO RESPONSIBLE DRUGGISTS.—Can save you 25 per cent. Will you allow us to send one to five gallons of our XXX Extract Vanilla at \$7 per gallon, regular price \$10. Guaranteed to go twice as far as any other make. We bought vanilla beans when the price was \$4 per pound; now they are selling at \$12. Order soon. Send check or reference and we will pay freight. John B. Hurtt & Co., Baltimore, Md.

Bugine

Spring house-cleaning will be sure to bring demands for something to exterminate roaches, bed-bugs and other insects. The druggist who keeps Bugine will be in a position to supply this demand in a manner which will give satisfaction. This preparation is non-poisonous to human kind and its use is attended with perfect safety. The manufacturers, the Iron City Chemical Co., of Pittsburgh, furnish plenty of advertising to call the attention of the public to the compound, and there is a good profit in it for the retailer.

Oil of Eucalyptus is now finding considerable application for throat troubles and is being put up in the shape of lozenges by the California Eucalyptus Co., Riverside, California, their product being known to the trade as the California Mission Eucalyptus Lozenge.

Look for No. 29 in this issue. It refers to a tooth powder put up by Henry C. Blair, Walnut and Eighth streets, Philadelphia. Look at the prices and make up your mind to do a little more business in the tooth powder line. Send for sample and see what it is like. Very few druggists can make up small quantities which will compare in quality and prices with Blair's No. 29.

From his close and intimate association with mankind and belligerent attitude which is displayed toward him, the common fly is credited with a large amount of misapplied intelligence. His great enemy is therefore constantly on the alert for means to encompass his destruction. One of these means which gives excellent results is Smith's "Sure Catch" Sticky Fly Paper. This paper has many advantages and has, for special features, flexible adhesive sealing herder, cross supports, and perforated center. To thoroughly understand all these features the trade is invited to send to the J. Hungerford Smith Co., Rochester, N. Y., for a miniature sheet which explains them quite plainly.

No. 608 A WINNER.

Even in an Off Year.

The favor with which our Perfumes are received in our new 8 oz. bulk bottle, No. 608, exceeds our most sanguine expectations. Nearly every wholesale drug house in the west and south now carry complete stocks, and can promptly fill orders for the leading orders at prices mentioned in the following select list:

White Rose.....	1.50	Crab Apple Blossom.....	1.50

Black Pansy.....	\$1.75
Extra Tonquin Musk.....	\$2.50
Extra Frangipani.....	\$2.50

FOOTE & JENKS,

Perfumers,

Jackson, Mich.

No. 608, 8 Oz.

Trade tributary to New York City can be supplied by McKesson & Robbins.

J. H. Day & Co., of Cincinnati, recently furnished machinery and fitted up a plant for the manufacture of chewing gum in that city.

The habits of flies in attending funerals of their kind is strikingly shown by the advertisement of Henry W. Stecher, in this issue. It also shows why Stecher's "Stick 'Em" fly paper is popular with the public, and why the dealer should handle it. Notice the prices.

When selecting your diamonds, the R. W. McCready Cork Co., of Chicago, advise you to be particular to see that the letter "M" appears conspicuously upon them. This advice also applies to the selection of corks. When you order tell your jobber to send you "Diamond M."

Norton Bros., manufacturers of tin boxes, 36 River street, Chicago, who were recently burned out, have established a temporary office at 83 Masonic Temple. Their factory at Maywood, Ill., is still in operation, and orders are being filled as usual.

Have you seen the Improved Wellcome shape rhalet capsules made by Platen & Son? If not, send for samples, and if you have any private formulas which you wish encapsulated properly at the lowest possible prices consistent with good workmanship, correspond with this firm, which makes a specialty of this class of work.

The Standard Flint Glass Works, of Philadelphia, have quite an extensive plant devoted to the manufacture of Homeopathic vials and glass syringes, and claim to be the largest producers of these specialties in the United States. Just now they are quoting very low prices on these goods and invite correspondence from large buyers. They guarantee prompt shipment.

People have been using mutton suet for years, and it requires no argument to convince them of its healing properties. When attention is called to Buck's Arnica Mutton Suet, people know at once that the combination is a good thing. Many druggists who are handling it report it as a quick seller and one that always gives satisfaction. See prices and terms on another page.

When figuring upon soda fountain supplies for the coming summer do not forget the success which "Malto" achieved last season. The public will probably want it just the same as they did last year. See prices in advertisement in this issue. It is sold by all jobbers, and manufactured by the Malto Manufacturing Co., Cleveland, who will send sample of advertising upon application.

"True Fruit" syrups for soda fountain use, manufactured by J. Hungerford Smith Co., Rochester, N. Y., are intended for the dealer who seeks the best trade and keeps it. They are made directly from the fruit without heat, possessing that fine natural fruity flavor, and are guaranteed to keep. Write for prices and discounts on large quantities.

MAP OF THE UNITED STATES.

A large, handsome map of the United States, mounted, and suitable for office or home use, is issued by the Burlington Route. Copies will be mailed to any address, on receipt of fifteen cents in postage, by P. S. Euetts, Gen'l. Pass. Agent, C., B. & Q. R. R., Chicago, Ill.

Fahnestock's Vermifuge has suited the people for many years past, and they still call for it when they are after a worm destroyer. Proprietary remedies which have stood the test of time are always safe goods to keep in stock, and Fahnestock's Vermifuge is one of this kind.

Duroy & Haines caution druggists to be particular when buying Duroy wines to see that they are shipped from Sandusky, Ohio, and made by Duroy & Haines. They are the only producers of these famous wines, and sell direct to the retail druggist. It will pay you to try Duroy Port Wine. Write for prices and sample. See advertisement in this issue.

Another name should be added to the list of those druggists who are constantly on the lookout to see where they can buy to the best advantage. It is that of the Kentucky Paper Box Co., 146-148 4th avenue, Louisville, Ky. Write them and see what they can do in the way of carton, folding and slide boxes.

Special attention is directed to what is believed to be a decided improvement in the Index of Goods which was inaugurated in the issue of January 1st. It is believed that the readers of the Era can now, by turning to pages 21 and 23, on the first red sheets in each issue, easily find any article in which they may be interested.

Do you ever think of the wide field which is open for the employment of remedies to prevent disease, and of the demand which will follow their introduction? "Protectio," manufactured by Dr. A. L. Worden, Detroit, Mich., is a remedy of this kind, and it meets with large sales whenever such diseases as diphtheria, sore throat, colds, etc., prevail. It retails for \$1 and costs \$9 per dozen.

Preston of New Hampshire had a letter from a leading wholesale druggist the other day referring to the now famous Rivermouth Sachettes. The wholesale druggist had a line of his own which he was pushing, but frankly said in his letter that when compared with Rivermouth his line was "way in a hole." The fact is, the people that want the best Sachettes are after Rivermouth. Why not write Andrew P. Preston, Portsmouth, N. H., and find out about them?

The Patent Curved Nursing Nipple Co., of Summit, N. J., have lately introduced to the drug sundry trade a new nursing nipple, an illustration of which is shown above. The advantages claimed for it are that it is easy to hold in the mouth; the liquid is always in the nipple and the infant has no chance to draw in air through it. It is easily cleaned and fits any bottle. Write for prices, mentioning the Era.

The Jack Frost Ice Shaver advertised in this issue by Whitall, Tatum & Co., of Philadelphia, is one which has many points which will recommend it to dispensers of summer beverages. Convenience and reasonable price have both been considered in putting it before the trade, and the description given may be read with profit by all who contemplate purchasing an apparatus of this sort.

The practice of charging soda fountains with specially prepared carbonic acid gas is now so generally followed that economy and discrimination in buying is now a necessity. For this reason the Chicago Aeriform Carbon Co., 40 West Polk street, Chicago, call attention to their goods in this issue, and invite inquiries respecting the economy and satisfaction which follows the use of their product.

The Syracuse Drug Co., of Syracuse, N. Y., have an article in Van Huskirk's Fragrant Cosmetic upon which the druggist can make some money. They furnish it in four colors, white, pink, brown and black, and it costs but fifty cents per dozen, delivered. Any druggist who will send them his name will receive a stick of the cosmetic free of charge. Mention the Era when writing.

The kind of proprietary goods which can't be "cut," unless you do it yourself, is the kind which bears your own name. This fact settled, F. E. Ingram & Co., of Detroit, Mich., can settle another one for you by quoting you prices on such goods, which show that the handling of the same is profitable. Send them your name and let them show you what they can do for you in this line.

See the change in the advertisement of Bell-Cap-Sic Plasters in this issue. A new offer is now before the trade, by which one dozen Kremlin Cream and two dozen samples of the same are sent free on an order for one-half gross of the plasters. This offer is only good for a short time. Send the order direct to J. M. Grosvenor & Co., 105 Milk street, Boston, naming your jobber who will bill the plasters, and the Kremlin Cream will be sent direct, express paid.

Put your name on a postal card and mail it to the Celery Medicine Co., of Kalamazoo, Mich. This will bring you their spring offer on Celery Tonic Bitters, and a photograph showing what the goods look like. They guarantee their preparation to give satisfaction, and refund money for any goods returned. Their spring offer may be worth dollars to you, as they claim you can make nearly double the amount of money on Celery Tonic Bitters that can be made on similar preparations.

The public has been educated to believe that great curative properties reside in Celery, Sarsaparilla and Beef, therefore when they see a preparation combining all three of these, as "Compound Extract of Celery and Sarsaparilla with Beef," and see that the price is only 50 cents a bottle, they come right in and buy it. This is the latest preparation manufactured by French, Cave & Co., of Philadelphia. They put it up in same size bottles as French's Sarsaparilla, and they print the druggist's name and address upon the label and carton. See prices in advertisement in this issue, and see if there is not some money in this preparation for you.

That the tablet triturate mold manufactured by the American Triturate Mold Co., 1139 South Twelfth street, Philadelphia, is possessed of considerable merit is evidenced by the fact that it is described with cuts in the National Dispensatory, last edition, page 1238. Any druggist, however, can convince himself of the superiority and cheapness of this means of dispensing a large number of drugs by sending to the firm for prices and full description of this unique and useful apparatus.

The labels, cartons and stationery now used by druggists are a great improvement over those in use but a few years ago, yet no druggist is content with things that are simply a little better than they used to be. He now wants the best, regardless of what his predecessors used. This desire is all right, and is clearly recognized by E. B. Read & Son, Baltimore, Md., who make it a point to fill just such a demand. Write to them for samples and prices on labels, cartons, etc., mentioning the Era.

The reputation of the French for fine medicinal preparations is one which is quite well known to the general public, and the consequence is that preparations such as Quina La Roche, Rigolot's Mustard Plasters, Duero's Elixir, Brou's Injection, Bland & Chapoutot's specialties, are always in good demand. These and many other foreign pharmaceutical specialties are handled by E. Fougere & Co., 26-30 North William street, New York, who will fill all orders which cannot be filled by jobbers.

Leavenworth, Kas., March 19, 1894.

Dear Sirs:—It gives me pleasure to say that I have now used your Empty Elastic Capsules for several years and find them most convenient, in fact indispensable. My assistants have become quite expert in filling them. They are well-liked by prescriber and patient and should be used by every progressive pharmacist.

Yours truly, ADOLF LANGE.

When buying tumbler holders it is a good idea to get something that is attractive as well as durable. The new style of tumbler holders manufactured by the J. C. Johnson Soda Apparatus Co., Philadelphia, are of this kind. They are strong, light, easy to clean, difficult to upset, do not catch drippings, fit several sizes of tumblers and are appropriately called the "Ideal." Sample sent by mail on receipt of \$1.25. This firm has a new design for counter soda apparatus, and will send an illustration of it upon application.

The 1891 catalogue of the John Matthews Apparatus Co., 449 First avenue, New York, is a publication of more than usual elegance, devoted to descriptions of apparatus which partake of the same character. The Climax Removable Glass Syrup Jars are among the desirable features of the Matthews' apparatus, and many users of them have testified as to their utility. The catalogue, which is sent free, tells all about them, and every owner of a soda fountain should investigate their merits. The Matthews Co. are prepared to quote prices on their new designs which will place them within the reach of all, and every prospective purchaser should compare their prices with those of other manufacturers before buying.

Hard times are generally prolific of great bargains. Manufacturers figure closely and the retailer reaps the benefit. The special offer of Schauden & Land, of Philadelphia, on page 11 of this issue, is deservedly meeting with liberal response. The new colors, "Gardenin" and "Sweet Scented Shrub," are excellent perfumes and good sellers, and with an opportunity of making 150 per cent on an investment of \$4 of \$8, live druggists are taking advantage of this offer. On orders received within the next thirty days the firm pays express charges.

One of the finest specimens of the skill of the artist and maker of books comes to us from Fritzsche Bros., New York. In the shape of a handsomely bound, finely illustrated volume, showing the various laboratories, factories and plantations of Schimmel & Co., Leipzig, Prague—Miltitz, and those of Fritzsche Bros., at Garfield, N. J. A very comprehensive history of the oil industry from earliest times and descriptions of the various processes now used by these firms has been especially prepared for this work by Prof. Dr. F. A. Fleukiger, Leipzig.

Lots of people believe that the best way to kill flies is to poison them. They will be more convinced in their belief if you show them the Green Fly Button. This new fly-killer consists of circular sheets of green poisoned paper, 3½ inches in diameter, and six of these comprise the retail 5-cent package. Their chief point of advantage, aside from their killing qualities, is that they fit neatly in the bottom of the ordinary sauce dish with no points to carry poison outside the dish. This feature is greatly appreciated by the housewife. They cost the dealer 2 cents per dozen packages, and are made by the Fly Button Co., Maumee, Ohio.

Lee's Serviettes, or Seamless Antiseptic Towels for Ladies.

These goods are made in three sizes, No. 1, smallest; No. 3, largest, and No. 2, medium and most generally used. They are medicated and antiseptic, and therefore afford cleanliness, comfort and health. They are woven without seam and cost no more than the washing of ordinary towels. A lady's toilet is not complete without them at home, and they are invaluable when traveling. They may be destroyed by burning when through with. They are manufactured by the J. Ellwood Lee Co., Conshohocken, Pa., who are supplying the London and Berlin jobbing trade with large quantities. They state that they have recently closed an order with one large firm for 5,000 gross. A sample will be mailed free of cost to all druggists who will write for one, and mention the Era.

Menn & Stubenrauch, manufacturing chemists, 83 John street, New York, manufacture all the standard pharmaceuticals and handle besides many specialties and drug sundries. One of the articles which they list is Prof. Damsch's Carbolated Sand, retailing for 15 cents, and sold to the trade at prices which leave a handsome profit. This sand contains 10 per cent pure carbolic acid, and is especially adapted for use on the floors of stores, factories, stables, saloons and closets, and on all floors not covered with carpet. Write for price list of this firm's products.

Containers for sending liquids and other merchandise through the mails are now recognized as indispensable in every well-regulated drug store. A consideration of this fact should include an inquiry as to the goods and prices of the United States Mailing Case Co., 40 Water street, Boston. Their mailing cases for liquids are admirably adapted for the purpose, and have received the approval of the post-office authorities, and their locked-corner boxes for powders and other merchandise combine a maximum of strength, with a minimum of weight. Write for price lists and circulars.

Every druggist recognizes the need of good, efficient help at the soda fountain, and he must have it if he succeeds in the business. But this is not exactly what the Beach & Claridge Co., of Boston, mean in the statement in their advertisement in this issue. The "help" they refer to is for the help, or the druggist himself, and consists of a catalogue telling all about the fine goods they manufacture in the way of soda water flavors, syrups, etc., and gives many hints and formulas for guidance in doing business. They will send the catalogue if you will simply express a desire to have it.

Have you investigated the merits of the Electric Ventilating Fans manufactured by D. H. Bates & Bro., Dayton, O.? These fans have certain advantages which make them especially desirable. They can be run on any direct current, incandescent electric light or street car circuit, and are furnished to suit currents of different voltage. They are of beautiful design, anyone can put them up, and they cannot be injured or destroyed, if prevented from rotating while the current is on the motor. If you want your rooms cool and free from flies and insects during the coming summer, investigate the "Bates" fan and motor.

It is only within late years that the soda water business has assumed such proportions as to call for expert knowledge of its various details. But such is the position of the business to-day. It requires special preparation and education to dispense soda water in a manner which is acceptable to the general public. It is true that a great deal can be learned from others, but that is not the plan pursued in these days in getting an education. Something more comprehensive is desired, and it is to fill this want that Saxe's New Guide has been prepared for the guidance of the soda dispenser. A man who absorbs the information contained in this volume is worth many more dollars in any position than the rule-of-thumb man. This increase in worth or earning capacity can be secured by sending \$3 to the Saxe Guide Publishing Co., 409 Dearborn street, Chicago, for a copy of the Guide.

Are you complaining of any decrease in sales of toilet articles and other drug novelties? Do you ever ask yourself if you are displaying such goods in a manner which will cause your customers to notice them? Do you want fresh ideas in this line? The Philadelphia Ornamental Wire Co. have a new catalogue now ready for mailing which will probably show you just what you want. It contains novelties in display stands for drugs and perfumery, sponge racks, tooth brush holders, and all descriptions of wire ware. This firm make a high grade of goods, and will make anything to order if desired. Write for this catalogue.

The reputation of the Low Art Tile Co. as artistic workers in clay is world-wide, and their productions in this line have found a place in many of the finest houses and public edifices of this country. These artistic qualities make them all the more appropriate as one of the chief features in the construction of what is now the most ornamental part of the drug store—the soda fountain. The mechanical details of the fountains manufactured by this firm are such as give the greatest effectiveness in cooling qualities with a minimum expenditure of ice, and the druggist who wishes to unite convenience, economy and beauty in his soda dispensing business will investigate the fountains made by the Low Art Tile Co., 352 Broadway, Chelsea, Mass.

Perhaps no mineral spring in recent years has come to the front with more rapidity and taken such a firm hold upon the public as has the Saratoga Victoria. The spring was discovered in May, 1892, in the building formerly used to bottle the "Champion" water at the "Geysers," Saratoga Springs, New York. The vein of mineral water was struck at a depth of 394 feet, after passing through slate rock, limestone and magnesium limestone. The flow of water is very large, yielding not less than thirty gallons per minute. The water is decidedly alkaline, and is very heavily charged by nature with an abundance of carbonic acid gas, making it extremely pungent and pleasant. The water is highly recommended for all kidney troubles, and is extensively used in the convalescent stages of typhoid and scarlet fevers. It is the ideal table water and is found on the tables of many of the leading families throughout the country.

An inspection of the catalogue of Woods, Sherwood & Co., Lowell, Mass., will be quite a revelation to those who are unaware of the great number of useful articles which can be made of wire. The drug trade will find many things which are exactly suited to its needs, both for displaying to good advantage novelties and pharmaceutical specialties and for sale to the public direct. You should have this catalogue.

The formation March 1 of the new firm of Franklin & Hyde, manufacturers' agents and brokers in druggists', manufacturers' and confectioners' glassware and supplies, 110 Randolph street, Chicago, brings before the wholesale and retail trade of the northwest two well known gentlemen. Mr. John Franklin, after a long experience in the firm of John M. Maris & Co., Philadelphia, has had the present business organized for three years past, and Mr. James D. Hyde has been for many years prominently connected as salesman with the wholesale drug business of Chicago and St. Louis. Producers and importers will find in the new firm reliable representation, and buyers may feel assured their interests will be fully protected.

Retail druggists are usually reserved and conservative in their comments on remedies handled by them, and when they do take the trouble to speak of one it is because they are thoroughly convinced from the experience of their customers that the article is one of unusual merit. Therefore the following, which is a sample selected from many recent ones received by the manufacturers, is worthy of attention from other druggists who wish a pile remedy which they can honestly and safely recommend to their trade.

Centre Hall, Pa., Dec. 18, 1893.

Parmelee Medical Co., Dansville, N. Y.:

Please send me two dozen Parmelee's Pile Suppositories. They give better satisfaction than any other remedy of the kind I ever sold. Yours truly,
J. D. MURRAY.

Regarding their new surgical dressing, recently introduced, the Norwich Pharmaceutical Co., of Norwich, N. Y., say that seventeen hospitals in New York City and Brooklyn have adopted the use of Unguentine. This certainly attests the efficacy of this remedy in the treatment of external inflammatory affections. There can be no question that Unguentine in a short time will supersede many other surgical dressings. It is composed of alum, which by a chemical process is made non-irritating, with carbolic acid and ichthyol added. These three drugs have no superiors among healing remedies, and their combination in an elegant pharmaceutical product can easily account for its popularity.

The attention of our readers is again called to the Salicylic Acid produced by the Herf & Frerichs' Chemical Co., of St. Louis. In former years all the salicylic acid came from abroad, and this accounts for the fact that many druggists are still in the habit of specifying European brands, while they might obtain an American make, which is fully the equal of any imported acid, and can also be had from any jobber by specifying H. & F. A sure sign of the absolute purity of Salicylic Acid is the melting point, which is 157° C., and Herf & Frerichs' make melts at that degree also. It will stand all the other tests prescribed by any pharmacopoeia. Buyers should give the preference in all cases to H. & F. Salicylic Acid, because it is made in this country, and is fully as good as any imported.

It is quite necessary for the successful druggist to know the alphabet thoroughly, but it is necessary to know but one letter when ordering corks, and that is the one which stands (like a certain brand of corks) at the top. Remember that the letter in question has a circle around it like the one which appears in the advertisement on the back cover in this issue.

A coin with a representation of the American eagle upon it is a very desirable possession. It is the same way with white lead. A package of this material with the well-known brand of the Eagle White Lead Co., of Cincinnati, upon it is quite sure to give satisfaction to the consumer, and this is the kind of goods which gives satisfaction to the dealer.

Besides manufacturing rubber stamp outfits, which every druggist ought to have, W. H. Dietz, 117 Dearborn street, Chicago, makes many other novelties. One of his late ideas is the Columbia Postal Scale. Most any scale will weigh postal matter, but this one not only weighs, but tells the amount of postage required on all the different classes of mail matter. This is done by simply placing the letter or package on the scale pan, and the machine does the rest. There is no adjusting of weights, or the poise upon the scale beam, as an indicator points to the correct weight, and the amount of postage required is printed opposite the weight figures. You will have to see this scale to appreciate it. Send for illustrated circular, which tells all about it.

IMPROVED BALANCE BEAM.

The general introduction of the metric system following the appearance of the United States Pharmacopoeia will doubtless cause a vast amount of confusion among those unfamiliar with its divisions. The Springer Torsion Balance Company, of 92 Reade street, New York, have provided for embarrassments of this kind by introducing a triple graduated scale beam. This beam is graduated in three systems of weights—avoirdupois, Troy and metric—and the divisions of each, with their comparative values, can be readily seen and marked off. Besides its practical value at the counter, the new beam will prove a useful instrument for familiarizing its users with the metric system.

The New Peck Cash Register No. 15 is one in which is especially adapted for the use of druggists, and the advertisement in this issue of the Peck Cash Register Co., Syracuse, N. Y., gives a very good idea of what it looks like. It consists of a desk cabinet, in the top of which there is an opening five inches long and one and one-half inches wide. The upper portion of this opening is covered with glass, immediately under which runs a continuous strip of paper from a roll, ruled in columns, on which can be recorded sales, disbursements and other cash transactions. When a sale is made it is recorded on the paper through the opening from that purpose. The proper combination then being pressed, the cash drawer is released and the record of the sale is moved under the glass, where it can be seen, but not tampered with, and a blank space is presented for entering the next transaction. This affords a means of keeping a complete record of each day's sales, and each man's sales can be kept separately.

To meet the very decided demand which comes from the medical profession for surgical dressings which can be kept perfectly fresh until wanted for use, the L. Ellwood Lee Co., of Conshohocken, Pa., have recently introduced Lee's Air-Tight Carton, a container which is, as its name implies, intended to preserve gauzes, etc., from all atmospheric influences or disease germs and enable the surgeon to use a fresh package for each and every dressing. The gauze is put up in one and five-yard packages. Many of the large hospitals of the country have adopted this method of handling surgical dressings, and the fact that they can be preserved indefinitely will encourage the drug trade to handle them and encourage the physician to patronize the pharmacist for such articles. Write for prices, mentioning the Era.

Every pharmacist has his own views as to the best and most profitable elixir or wine of calisaya for him to handle. Many manufacture and sell their own preparations. This is one view of the question. The other is that advanced by Charles Allen Itted, 9 Cliff street, New York, and is based upon qualities which he claims for his Calisaya La Rilla. This preparation is the exclusive product of one laboratory, and this fact accounts for the unvarying high standard which distinguishes it. This buying and manufacturing in large quantities enables the manufacturer to quote prices which are ordinarily beyond the reach of those who put up similar preparations in a small way, and the trade will do well to correspond with Mr. Reed regarding his specialty.

C. A. Julian, M. D., Louisville Medical College, in N. C. Med. Journal, writes in regard to Antikamnia: "This is a combination of elements belonging to the coal-tar group, and is an American product. It is a white crystalline powder, odorless, and has a slightly burning taste; soluble in hot water and in diluted alcohol, but not in cold water. It acts as antipyretic, analgesic and anodyne. The importance attached to this drug, I think, is due to its anodyne and analgesic power, and the celerity with which it acts. As an antipyretic in fevers, it acts more slowly than antipyrine but is not attended with as much depression of the cardiac system and cyanosis. Whenever a sedative and an analgesic together is indicated, this remedy meets the demand. In severe headaches it is the remedy par excellence."

Buyers for drug houses will recognize the want of a systematic method for filing quotations and samples, whether by catalogue, circular, letter or by salesman. The Folding Paper Box Co., of South Bend, Ind., is offering one that it believes to be perfect in the record it makes, and in the time required, which is less than that called for by most others. This system has stood the test of more than a year's use, with increasing demand for its sale. Send for copyrighted description, a reading of which and nothing else will adequately give a correct impression of what it is, as a mode of doing things. It is in use in hundreds of the largest establishments in the United States. A "case" with 21 small boxes and 6 large ones, with index and all necessary fixtures, suitable for retail druggists, costs only \$15.00.

"Komseals" are made of rice-flour and water, are absolutely soluble, elastic, tasteless, digestible and will remain unimpaired by climatic changes for years. They are just the thing for dispensing powders. Twelve million were sold in Paris last year. J. M. Grovener & Co., 105 Milk street, Boston, are the American agents.

Have you seen the "Gypsiue Advocate," the attractive little 4-page paper used to advertise Gypsiue? It tells the public all about this new wall coating, and the bright reading matter makes it a valuable advertisement for the dealer who handles Gypsiue and has his advertisement in the publication. Send for a copy and judge of its merits. As for Gypsiue itself, it is a stone-like substance which sets solid on the wall, does not flake off, and is used on old walls and rough surfaces prior to painting. It is admirably adapted for relief work, being applied to the wall thick and then applied, combed or worked into any pattern desired. It is also used as a disinfectant around sinks, closets, etc. The druggist who keeps it and distributes the "Advocate" among his customers will surely have a good demand for it. Sample of color cards and advertising will be supplied upon application to the Diamond Wall Finish Co., Grand Rapids, Michigan.

From present indications the innocent fly is going to have a hard time of it this summer. His latest affliction is a sticky paper put upon the market by the Detroit Fly Paper Co., Detroit, Mich., which has many attractive features (or flies). Knowing that the chief personal characteristic of a fly is curiosity, and that nearly every fly acts just like all the rest of his family, this new paper has decay flies printed upon the surface upon which the sticky composition is spread. This acts as an incentive toward close investigation, and is quite effective in rendering the inspection a protracted one. The paper itself is a new product, made impervious to the oily mixture, and the border, which is embossed, is part of the sheet and cannot chip off and litter up the carpets and furniture. Perfect satisfaction is guaranteed. A sample box will be sent on receipt of 40 cents. See advertisement on page 30 this issue, and when ordering mention the Era.

The Hero Fruit Jar Co., of Philadelphia, call attention to their new whiskey bottle stopper to be used on bottles containing fine brands of whiskey, to prevent refilling. They admit that numerous stoppers for the same purpose have been brought forward of late, but they think that the years of experience gained by them in the manufacture of all kinds of bottle stoppers gives them a great advantage in the production of such an appliance. They know that an expensive or complicated stopper is useless for the purpose, and they put forth the following claims for this one: Thorough prevention of refilling; strength; compactness; cheapness; great convenience, for in using this there is no cap to be taken off, but merely two turns of the hand for opening and the same for hermetically closing; free flow, but perfect cleanliness; no slopping, dripping, or waste; simplicity and attractiveness. Send to them for sample and price, mentioning quantity desired. See advertisement in this issue.

In the last issue of our Druggists' Directory we classified the Sagar Drug Co., Duluth, Minn., as wholesale and retail druggists. This, they inform us, is an error. They are an exclusive jobbing house, and have no intention to retail, nor have they any facilities for carrying on that branch of the drug business.

RELIABLE AND SALABLE AT ALL TIMES.

Planten's Capsules have been on the market since 1836, and their sales continue to increase steadily as the years pass, fully demonstrating that their reliability has become well recognized and firmly established, and further that "the best" goods always remain popular with consumers and are most profitable to keep in stock. The most popular in demand of these goods are the Pure Copaiba, Compound Copaiba and Cubebs (also known as Planten's Black) and the pure Sandalwood Oil Capsules in 15, 10 and 5-minim sizes hard, and the 10-minim size elastic, soft. These as well as the Peruloids, 5-minim, with several of the other many varieties can always be carried in stock to advantage. The jobbers all carry Planten's Capsules, and you can get your supplies from them in lots to suit, and kinds they may not have on hand will be sent by the manufacturers on receipt of the list price.

At a time when the retail price of soda water has apparently reached its minimum and competition requires great outlay for attractive apparatus, it is quite important that the dealer in this beverage should turn his attention to the cost of production. Marble dust and sulphuric acid are cheap, the apparatus is not highly expensive and the cost of labor in making gas is perhaps nominal, but in spite of the apparent cheapness of the old process, The Liquid Carbonic Acid Manufacturing Co., 437 Illinois street, Chicago, claim that they have something still cheaper. The apparatus they furnish costs no more than the old generator and they furnish the gas in liquid form, ready for use, whenever wanted, cheaper than it can be made by the ordinary dealer. When competition, hard times and a tendency to lower prices seem to be ruling forces, the man who is alert for business always looks out for things of this kind. Perhaps you are that kind. If so, the firm referred to will be glad to send you their catalogue.

THE PAINT TRADE REORGANIZED.

The Paint, Oil and Varnish Trade Section of the New York Board of Trade was organized on March 20, with a membership of thirty firms. The meeting was called to order by Mr. C. H. Patrick, Mr. John A. Elmsdorf, of Edward Smith & Co., was elected permanent chairman and director in the Board of Trade, and Mr. C. H. Patrick permanent vice-chairman. Mr. J. W. Coulston was elected secretary and treasurer. The executive committee was chosen as follows: H. Merz, A. B. Garner, R. Pyatt, W. E. Lucas, George W. Fortmeyer, M. D. Eger. The executive committee was authorized to appoint the standing committees.

The first Tuesday in each month at 1:30 p. m. was agreed to as the day and hour for regular meetings of the section. The executive committee held its first meeting Tuesday, March 27, at 1:30 p. m.

DECORATIVE HINTS.

In commenting upon the prevailing tastes and styles for interior decorations, The Plumber and Decorator, says: "White and gold for interior decoration has long been a favorite and of late years has gained in popularity. This increase in popularity will probably lead to white enamel effects being used for interior work in connection with a moderate amount of gold pickings. Light cream, very light pink, light sap green in enamel with gold in each case, renders an interior very charming, provided of course, that the colors are used the reverse of freely, and the gold is employed only as a means of giving emphasis to the decoration and relieving from its insipidity."

"Much of the beauty of schemes of color applied to the interiors of dwellings is due to the use of those colors known as transparent. Not that these allow the complete passage of rays of light, but that when superimposed the ground color has a modifying influence upon their hues and tones, giving them a depth and richness such as cannot be obtained by any opaque or heavy-bodied color, which of itself constitutes a compact film. Leading transparent colors are crimson, scarlet, purple, blue, green, yellow and brown. They are sometimes used for glazing, being first rendered sufficiently transparent by the admixture of a large proportion of vehicle.

"Between heaven and earth, the predominant colors in nature are seen in the green of trees, in the purple of distant atmospheric effects, and in the orange color of clouds at sunrise and sunset. These colors—green, purple and orange—are called secondary colors; and together with admixtures of the neutrals to produce tints and tones, should be used on walls, letting the secondary wall colors harmonize with the primary ceiling color. Thus, if a ceiling be a tint of blue, the wall should be a tone of orange; if the ceiling be pink, salmon color or a tint of red, the wall should be a neutral green; if the ceiling be yellow or cream color the wall should be, purple in tone."

THE LACQUER TREE.

Japanese lacquer, properly so called, is the gum of a tree, the *Rhus vernicifera*, which is laid, coat after coat, upon thin sheets of wood or some other substance. The most extreme delicacy and patience are required, and many hundreds of hours are spent in the successive dryings demanded by the lacquer; and when all has been done, there follows the elaborate decoration in gold, silver, other metals, or mother-of-pearl. The art is of great antiquity.

Mr. Ernest Hartk knows no reason why the lacquer tree should not be grown in this country, says the Plumber and Decorator (London). Its sap, which is used as the material of all lacquer work, is a natural essence, having a vast superiority over any varnishes used here. Unlike even copal, which is an artificial mixture of resin, fatty oils, and turpentine, Japanese lacquer is a ready-made product of nature, which, when hardened, is of mirror-like smoothness, unaffected by either acids or hot water, and of great duration, never splitting or cracking.

THE MARKETS.

The fluctuations noted in this market report are those affecting goods in original packages and jobbing lots. A complete price list, showing quotations as made by jobbers to retailers, will be found upon another page under the head of "Prices Current."

ADVANCED.—Balsam Peru, Cod Liver Oil, American Saffron, Mexican Sarsaparilla, Corlander Seed, Benzoic Acid, Blue Vitriol, Cascara Sagrada, Permannanganate of Potash.

DECLINED.—Opium, Camphor, Nitrate of Silver, Oil Peppermint, Fennel Seed, Oil Orange, Oil Lemon, Oil Cubeb, Gum Chicla, Guarana Golden Seal Root, Sulphur.

New York, March 22, 1894.

Jobbing orders have been coming to hand rather freely, giving the general market a fairly animated appearance, but on the other hand, the larger dealers and those interested in the movement of round lots, are inclined to complain regarding the slow demand. With the financial affairs of the country on an uncertain basis and discussion of the tariff question unnecessarily prolonged, it is not surprising that buyers should adhere to the policy of purchasing almost wholly in accordance with actual necessities, and no improvement of consequence need be expected until those two important matters are definitely settled. This opinion is based chiefly on the fact that, notwithstanding the unusually low prices ruling for several commodities, there is apparently a steady determination not to anticipate the wants of the future. It is evident, however, that the majority of holders are not disposed to force business through the medium of concessions, and the general undertone of the market indicates steadiness, with the fluctuations in values mainly the result of natural causes. An important factor is the continued light stocks at interior distributing points, which, under ordinary conditions, must sooner or later be replenished, and holders are in a measure, justified in anticipating an early improvement in the demand for large parcels.

OPUM.—The market has continued to reflect an easy tendency with the course of values toward a lower basis, quotations for both spot and futures having declined fully 20 cents per lb. during the past fortnight. The reduction in price, however, has not stimulated the demand, and inactivity has been the characteristic feature, with buyers not disposed to exceed current requirements when making purchases. The spot supply has been materially augmented by additional large arrivals, and as manufacturers and other large consumers have abundant stock for the present, there is every probability of a further accumulation, as the recent liberal purchases in primary markets for American account have not yet all come to hand.

POWDERED OPUM.—Is corresponding lower in sympathy with the gum and only limited quantities are moving.

QUININE.—The volume of business has been of full proportions recently, the movement being wholly for consumption and the market retains a firm under-tone. The recent sale of bark in London and Amsterdam have resulted in the establishment of a higher range of prices and it has been generally anticipated that

manufacturers would notify their agents of a further advance in Quinine, but no such intimation has yet been received, and orders are freely looked at the old range of quotations. American makers report a continued fair movement at steady prices.

MORPHINE—Is moving steadily on contract orders, but the current demand is less active, and manufacturers' prices are unchanged.

MAIZE OIL—Grain is unsettled and irregular owing to offerings by producers not controlled by the combination. The rebate system of the latter organization, however, prevents the larger buyers from taking advantage of the low prices named by outside producers, and only the smaller buyers are benefited. There has been no further change in Wood, but a somewhat steeper feeling is manifest, and a reaction in values is considered probable.

GLYCERINE—Sharp competition between local and western manufacturers has had an unsettling influence, and although dealers still name the former range of quotations, concessions are frequently made to regular customers.

CAMPHOR—Free offerings of the Japanese product have resulted in domestic manufacturers marking down their prices 3 cents per lb. on both barrels and cases.

BALSAM COPAIBA—Is firmly held at former figures and a good trade demand is noted for Central American. The outlook is favorable to a continued steady market in view of the fact that recent arrivals to first hands are being shipped to foreign markets where better prices are obtainable.

BALSAM TOLU—Is selling fairly to consumers at unchanged prices.

BALSAM PERU—Continues to show a hardening tendency under the influence of reduced stocks together with unfavorable crop reports from primary sources of supply, and values show a further advance of about 10 cents per lb.

BALSAM FIR—Canada continues to offer with increased freedom, and the tone of the market is easy but lower figures are not openly quoted. The demand is light and unimportant.

COD LIVER OIL—Continued activity has prevailed during the period under review with a further material improvement in prices, and buyers of large parcels have been unable to fill their orders. Holders are unwilling to sell except in a jobbing way, and from present indications the outlook warrants still higher figures as cable quotations from Norway are already above the parity of current values here. It is conceded that the catch is unusually small and even with only an average consumption there is likely to be a shortage before the next catch can be available.

AMERICAN SAFFRON—The hardening tendency previously noted has resulted in an advance of 2 cents per lb. by the principal holder. The demand has been active with buyers willing to take liberal quantities, but only small parcels are obtainable and the trend of values is toward a still higher basis.

NITRATE OF SILVER—Has again been reduced 1 cent per oz. by the manufacturers.

CACAO BUTTER—Is in rather better supply and slightly easier for bulk, but there is no material change in values. Cases continue scarce and firm.

OIL PEPPERMINT—H. G. H. is offered more freely at concessions from

previous prices and the various grades of bulk oil show a lower range, but the market is without much activity and the business reported is only of a jobbing character.

JALAP—Fresh supplies have been arriving from primary markets, but the liberal receipts being of desirable quality, buyers have purchased freely and values indicate continued steadiness. In fact, for new goods sellers are disposed to ask an advance.

MEXICAN SAIGAPACHILLA—Is firmer and all the available stock in first hands is said to have been taken up by dealers and exporters. For jobbing quantities a fractional advance in prices is noted.

CORIANDEI SEED—Available stocks have been steadily shrinking and sellers have further advanced their selling limit. The principal holder still declines to quote.

FENNEL SEED—New crop German continues to arrive freely and values show a further decline.

OIL OF ORANGE—Sanderson's brand has been reduced 10 cents per lb., and other varieties are proportionately lower.

OIL OF LEMON—Competition between sellers of the better grades has been rather keen, resulting in a decline of 5 cents per lb. in the various leading brands. Primary markets, however, show continued steadiness.

CUBE OIL—Has developed a weaker tendency and sellers name a lower range of quotations.

MANNA—Values are practically unchanged, but slightly off quality small cake is offering at a shade under quotations for prime.

CAFFEINE—Is held firmly at the advance previously reported and holders are indifferent sellers.

SAL AMMONIAC—Shows increasing firmness and some holders have further advanced their views regarding prices.

BENZOLIC ACID—True German is higher abroad and a stronger feeling is noted here. English is quiet and nominally unchanged.

BLUE VITRIOL—Is tending upward under the influence of reports intimating that all the large manufacturers are about to form a combination with a view of controlling the general output, and establishing prices upon a better paying basis. Current values are fractionally higher and only small parcels are available at inside figures.

CHICLE—Has ruled easy under pressure to realize and liberal sales are reported from first hands at a decline of about 2 cents per lb. One or two other parcels, recently arrived, are pressed for sale, but the bulk of the stock is held with a fair degree of steadiness, the limits of shippers being considerably above current quotations.

ASSAFOETIDA—Is ruling strong under a good trade demand, and spot stocks of desirable grades are steadily diminishing.

GUARANA—Continues to rule weak under liberal offerings and values show a further decline of about 5 cents per lb.

CASCARA SAGRADA—Has been in active request, with rather free buying by fluid extract manufacturers, and a firmer feeling has developed with values for the more desirable grades showing a fractional advance.

GINGER—New crop Jamaica has been arriving in liberal quantities, but the quality of receipts thus far is considered hardly suitable for bleaching and the

bulk of sales has been to grinders. Values of bleached are consequently steadily maintained at previous figures.

HEPACUANIA—Continues to rule firm in foreign markets, but the situation here is unsettled owing to competition between sellers and any inclination to advance prices is checked by free offers to accept old figures.

GOLDEN SEAL ROOT—Is offering at slightly lower quotations, and moderate transactions are reported at the decline.

PERMANGANATE OF POTASH—Has been advanced 1 cent per lb. owing to decreased available stocks.

CREAM TARTAR—The market retains a firm tone with a fair average business in progress, chiefly in powdered.

CUTTLE FISH BONE—Is still available at the comparatively low prices with the consuming demand fair, particularly for prime Trieste.

SENNA—Intermediate grades of Tinnevely continue in good request for consumption with values ruling strong and tending upward.

SUGAR OF MILK—Decided activity has followed the material concession in prices previously referred to, and liberal sales have been made to the consuming trade at the lower range. Large buyers have been anxious to make contracts, but manufacturers decline to book orders beyond the usual thirty day period and some predict an early improvement in the general condition of the market.

VANILLA BEANS—Are moving freely in limited quantities with all varieties sharing in the general distribution and values are ruling strong.

SULPHUR—Resublimed has been reduced 1/8 of a cent per lb. for both roll and flowers.

THE SULPHUR INDUSTRY OF JAPAN.

Sulphur, called in Japanese "Iwo" or "yuwo," is found as a glossy product of sublimation, often covering the crater walls, crevices and clefts of active and extinct volcanoes throughout the country. By far the greatest amount of Japanese sulphur is formed by decomposition of sulphureted hydrogen of the very numerous solfataras. The export trade in this article has grown rapidly since the opening of the country to foreign commerce. In the year 1838, the earliest date for which reliable customs statistics are available, there were exported 131 tons, valued at \$6.49. In February, 1839, there were 84 mines in operation, of which only 13 produced annually more than 100 tons each. Ninety-five other mines were located and under trial excavation by government permit. No official estimate has been made of the quantity of sulphur still available. The total product of the country during 1891 (that being the latest year for which reports are published) was 44,565 tons, of which 21,923 tons were refined sulphur.—U. S. Consular Report.

The United States consul at Bradford, England, in reporting upon the standard of living in his district, says that it is "high," and in support of his statement further says that the people have four and sometimes five meals per day, viz.: breakfast in the morning, dinner or luncheon at noon, tea at 5 p. m., and supper at 8 or 9 o'clock in the evening.

W. M. SEARBY.

IN considering the prominent educators in the profession of pharmacy, the name of Prof. William M. Searby, of San Francisco, cannot be overlooked. The California College of Pharmacy was largely the outgrowth of his forethought and labors, and to him, perhaps, more than any other man, it owes its present high rank and standing in the profession. He has been identified with it since its formation, during which time he has served it continuously either as trustee, president or professor of materia medica, the latter a position he assumed in 1873.

Prof. Searby was born in Lincolnshire, England, in 1833, and received his education in one of the many excellent boarding schools in that section. At the age of 14 he was apprenticed to the drug business in the person of E. W. Martin, of Guildford, Surrey, where he continued until

1855, when he entered the laboratory of the Royal Pharmaceutical Society of Great Britain for a term of months. Passing the "major" examination in 1856, he immediately entered into business relations with his brother-in-law, the two conducting a successful pharmacy in the city of Norwich until 1860, when he left for Vancouver Island, British North America, carrying on the drug business at that place until 1866. In that year he removed to San Francisco, engaging in the practice of pharmacy, where he is still located, a member of the well known firm of retail pharmacists, Searby, Zeilin & Co.

As a writer he has done much to advance the educational and professional status of pharmacy in this country. In addition to his many other duties he became the editor and publisher of the Pa-

acific Druggist in 1892, a relation which he was forced to sever the present year on account of its arduous demands upon his constitution and the press of other business and professional engagements.

Personally, he is a man of strong convictions of duty, of force of character, earnest and zealous in not only his business, but in everything that pertains to the advancement and elevation of his chosen profession, and, as one has justly said of him, "he has looked on the outside sufficiently to know that the drug store is not the entire universe, and he is willing to do his share in the battle of life that others may derive benefit besides himself."

Prof. Searby is a member of the American and California Pharmaceutical Associations, dean of the California College of Pharmacy and an able and fluent speaker.

ENTERED AT THE DETROIT OFFICE AS SECOND-CLASS MATTER

ESTABLISHED 1897.

THE PHARMACEUTICAL ERA.

SEMI-MONTHLY.

Issued on the 1st and 15th of Each Month.

D. O. HAYNES & CO., Publishers,
DETROIT, MICH.For Subscription and Advertising Rates see
advertising page 30.**REMOVAL NOTICE.**After May 1st, 1894, the publication office of
THE PHARMACEUTICAL ERA will be at

106 Fulton Street, New York City.

With increased facilities and the additional advantage of being in close touch with the leading drug markets, we expect to introduce many new and valuable features in the journal, which will be to the advantage of our subscribers and advertisers.

D. O. HAYNES & CO.,
Publishers.**EDITORIAL.****EXAMINATION QUESTIONS.**

We omit for this number publication of replies to Examination Questions, Series No. 2, it being found advisable to delay this matter until our May 1 number, when the names of the successful contestants, together with the portrait and sketch of the one standing highest in the competition, will be presented. We beg our readers' indulgence for this unavoidable delay, occasioned merely through inability to get the matter ready in time, because of the fact that the present issue we were obliged to send to press somewhat earlier than customary.

THE TEACHING OF PHARMACOLOGY.

The second installment of the article upon this topic is presented elsewhere, and we are pleased to see that it bears illustrations of pertinent connection with the text. We have seen evidences of considerable interest in the paper, and believe the present portion, with the conclusion to appear in the next succeeding number, will combine to make a presentation of the subject of notable worth to teachers of pharmacy. There is a decided disposition on the part of the more progressive element among pharmacists to strive for the attainment of a higher standard of proficiency, and teachers and practical men alike give their most careful consideration to all propositions looking to this end, and read with avidity papers bearing generally or particularly upon the subject of teaching pharmacy.

VERY FRANK.

We quote from a Massachusetts paper the following exceedingly frank statements: "The statesmen who are proposing to tax proprietary articles, cosmetics, perfumery, etc., doubtless see only increased revenue for the government, but do not see the vast injury which is certain to result, not only to manufacturing advertisers, but to the entire press of the land. The sale of the articles upon which a tax is proposed is brought about by advertising in the newspapers, and the expenditure in this direction during every year amounts to very many millions of dollars. If the tax proposed by Congress is carried into effect, it will result in the

dissolution of many worthy advertisers who manufacture standard preparations, and a very large curtailment of all advertising expenditure throughout the press of the land. The increased amount of revenue which the government will receive will not by any means equal the decrease in the amount of advertising patronage which the press of the land now receives."

THE ALCOHOL TAX.

The proposed increase of internal revenue tax on spirits is bringing out vigorous protest from the drug trade. The attempt of Senator Cockrell and others to belittle the importance of the matter and to impugn the motives of the druggists, has but served to secure wider and more determined agitation. Were the public to fully understand the relation borne by alcoholic compounds to the public weal and prosperity (leaving out of consideration their use as beverages) there would rise a stone wall of opposition to any attempt to increase the cost to the consumer of spirits and the articles in whose manufacture they are essentials. We have no quarrel with those who would tax whiskey and brandy as beverages, but a heavy tax on alcohol has no reason in justice or necessity. It means added expense in the sick room, a numbing influence upon many arts and industries. Raise the cost of liquors as beverages and luxuries as much as you will, but as necessities in the sick room and in manufactures let them be free. The cost of a beverage is not prohibitive of its use, but heavily taxed alcohol is a bar to its employment in a host of industrial operations. The drug trade should keep hammering away at this matter till reason enlighten our law makers, and this relic of war taxes on necessities become of the past.

COUNTER-PRESCRIBING ILLEGAL IN CANADA.

Our Canadian pharmaceutical exchanges have been giving considerable attention to a recent decision in the Common Pleas Division of the Divisional Court, wherein the judge refused to quash a summary conviction by the police magistrate of a druggist charged with illegally practicing medicine. The judge's interpretation of the law is of particular moment to Canadian druggists and may interest their brethren in the states as showing where the line of conduct must be drawn in order to be safe. We make use of the Canadian Druggist's report: The alleged offense in this case was indicating a medicine for symptoms described by a customer and selling a bottle of it at the regular price. The defense, instead of being a denial of the charge, was an attempted vindication of the practice by contending that this was not practicing within the meaning of the act, and, even if it was, it was not for gain, and even if it was for gain, the defendant was entitled as an apothecary, so to practice.

The court held that there was evidence of practicing medicine on which a magistrate might well convict; that it was practicing for hire or hope of reward, and that the defendant's registration under the pharmacy act did not qualify him to practice in the same way that one registered under the medical act as a physician and surgeon could practice. The judge held that a druggist can properly

tell a customer the name of a remedy for a disease, or even tell him which of several remedies he deems his best, but can not legally inquire into the customer's symptoms to ascertain the nature of his ailment and then indicate the remedy.

DEATHS FROM POISONOUS DRUGS.

One of our English contemporaries, some time ago, made the statement that carbolic acid is responsible for more deaths (in Great Britain) than any substance in the pharmacopoeia. This was in connection with some comments under the caption, "Carbolic Acid and the Pharmacy Act." The conditions governing the sale of poisons in England are different from those obtaining here, and our contemporary's exposition of the matter would have little application in America. But it seems that some readers, notably many makers of carbolic acid, have seen fit to question the statement mentioned, and offer some statistics regarding deaths from drugs, which are of very general interest aside from any bearing upon the particular case in question. We are told that the deaths in 1891, classified according to their causes, make the following showing: Drugs, 296; scheduled drugs, 197; unscheduled drugs (not including carbolic acid), 68; carbolic acid, 31. In another comparison we find that during the same year carbolic acid was responsible for 31 accidental deaths and 63 suicides, while the respective corresponding figures for laudanum were 97 and 53, a showing in favor of carbolic acid of 94 to 150. The articles named seem to be favorites among our British cousins as agents for shuffling off this mortal coil. The American revolver and the more sensational atropine find greatest favor here. But, in all sober earnest, there seems to be very great necessity for some way of making it impossible for the general public to obtain drugs of potent nature, which, in ignorant, careless or wilful use, may cause the loss of human life.

OWNERSHIP OF THE PRESCRIPTION.

We have read with great pleasure the views of the Medical Record upon this much vexed subject. It is considered dispassionately and logically, and the point of view is shifted as necessary to represent the interests of physician, pharmacist and patient. The conclusion arrived at is that the pharmacist is the owner of the prescription, as has also been held in several legal decisions. A review of the arguments leads naturally to this conclusion, and we congratulate our contemporary upon its able exposition of the case.

What and whose are the rights and privileges to be considered? The physician writes a prescription intending it to be used only in accordance with his directions, he is not responsible beyond this, and if the patient insists upon disobeying orders, the physician does not share the risk or become accountable for any bad results. In an equitable sense, says the Record, the prescription is the patient's property only in so far as it can serve the specific purpose for which given. When these conditions have been met, the prescription, so far as prescriber and patient are concerned, practically has no more existence than if it had never been written.

When the patient is no longer in need of it medically, and persists on his own account in repeating the prescription, he is appropriating that which, profession-

ally speaking, does not belong to him, and he does a still greater wrong when he gives it to another, whom it may seriously harm, and then the new man who takes the medicine is the bigger fool of the two.

But just here the pharmacist comes in. While there is no law to prevent a patient repeating a prescription as often as he pleases, it is ethically wrong for the compounder to allow him to do it. The prescription is not in any sense so much the property of the druggist that he can do what he pleases with it. It is simply a particular order for drugs, and can in no proper sense be used as a general one on demand by any would-be customer. The pharmacist places the prescription on file as a legal evidence that he has fulfilled a special contract. It is, in fact, his only protection against subsequent damages arising from alleged inaccuracy in compounding, or mistakes in the selection of ingredients. But he owns it as a voucher only, and cannot legitimately use it for any other purpose. Consequently, when he attempts to do otherwise he is in every way transcending his functions, and acting most unjustly to both physician and would-be patient.

The pharmacist is responsible for the proper compounding of the prescription, and has a right to it as a voucher. To be sure, there is no law to prevent his repeating it in any manner he chooses, and the patient, or any one else, can buy the compound of which it is the order if the druggist chooses to sell the same; but if the mixture contains any poisonous ingredients, or the patient can claim to have been damaged by taking it, the compounder is liable for damages as a seller of poisons without license. In case of any serious perversion of the original intent of the prescription, both parties in the action are culpable, and take extra responsibility at their peril. In ordinary cases, however, no legal interference is contemplated. If a druggist recommends the prescription to a stranger, he virtually attempts to give him medical advice, which opens him to the charge of practicing without legal authority.

Unfortunately, there is no remedy that will legally fit such unprofessional usages. The physician has no power to insist upon a return of his prescription or forbid its indiscriminate use, save on purely professional grounds of common courtesy. When the prescription is given to the patient it is virtually beyond the prescriber's reach. The patient, having paid for it as part of the advice given, claims the right to use it for himself as often as he sees fit, and can, with the druggist's consent, secure a copy of it for such purposes. It is usual, however, for the pharmacist with a proper moral sense to respect the wishes of the prescriber, and when he does not do so it is also customary for the physician to obviate the necessity of having any difference of opinion upon the subject in future by advising the patient to patronize some other shop, or he retaliates in kind by furnishing his own medicines whenever suitable opportunities offer.

PIXOL.—A soluble wood tar preparation; 3 parts of wood tar warmed with 1 part of soft soap, this gradually mixed with 3 parts of 10 per cent KOH solution. It is a transparent solution, miscible with water in all proportions. Disinfectant properties equal to Lysol.

RESTRICTING THE USE OF OPIATES.

A bill, referred to by our Buffalo correspondent, has been introduced into the New York legislature, and is causing considerable talk in the drug trade. It provides that:

1. No pharmacist, apothecary, druggist or other person shall sell, give away, dispose of, or offer for sale, except to dealers supplying the trade, and regularly licensed practicing physicians, surgeons, dentists and veterinary surgeons, any opium or morphine, or any chloral or cocaine, or any preparation containing opium or morphine, or any form of opium or morphine of them, except upon the written order or prescription of a regularly authorized practicing physician, stating the date when issued and the name and place of residence of the person to whom issued, and within two days after the date contained in such prescription, or fill or refill more than once prescriptions containing opium, morphine, or cocaine, or any one of either of them, or cocaine or chloral, in which each adult dose shall exceed of opium one-quarter of a grain, or of morphine one-twentieth of a grain, or of cocaine one-half of a grain, or of chloral 10 grains, and the packages containing such prescriptions are labeled showing the particular form of such drug, and the quantity of such drug contained in each adult dose.
2. No physician, surgeon, dentist or veterinary surgeon shall supply his patients with opium, morphine, chloral or cocaine in doses greater than is specified in the first subdivision of this section, except the package containing the same is labeled showing the particular form and the quantity of such drug contained in each adult dose.
3. Every physician residing in the state who gives a prescription for opium in any form, cocaine, or chloral, shall keep a record of the same in a book kept for that purpose, giving the name of the patient and the date of each prescription.
4. No person shall manufacture or sell, or offer for sale, or give away, or supply to any patient or propriety medicine containing opium, morphine, chloral, or cocaine, in any form in which each adult dose shall contain such drugs in such quantities less than is specified in the first subdivision of this section, except upon the packages containing the same are labels upon which is legibly and plainly printed or written in red letters and partly written in red letters the name of the particular form of such drug used, and the amount of the same in each adult dose of medicine.

Much opposition to this proposed amendment has developed. It certainly is very radical in its provisions, its framers evidently believing that there is altogether too much laxity in the use and sale of narcotics. It is quite natural that druggists and doctors should be ranged against it, for its observance would mean considerable annoyance in the matter of registration and none of us like any departure from the old established order of things, and be hampered by little details. But are not the animus and intent of the bill good? Morphine, cocaine, chloral and the like are dangerous agents, quick to form habits destructive of health, morality and reason, and no restriction should be deemed too onerous which will in part or whole prevent their easy purchase and illegitimate and indiscriminate use. The physician objects to keeping a record of his prescriptions as proposed, and it would be very hard to enforce this regulation. But he is frequently the real cause of the formation of the drug habit by the patient through his readiness to prescribe it. The druggist contributes to the result by supplying the drug on demand. We are inclined to think well of this measure, for if rigidly enforced it must make it very difficult to procure and make unauthorized use of these drugs. There are of course some weak and objectionable portions in

the bill, but its purpose seems good, for there is not a doubt that there are doctors and druggists who will bear watching in this matter. The section relating to patent and proprietary preparations is excellent; manufacturers should not be allowed to use opiates at all in preparations advertised and sold to the general public.

It may be there are real objections which are not readily apparent, but we fail to discover anything likely to prove detrimental to the general well being of the public, for whose protection it is devised.

We are reminded by this discussion of a paper read before the Michigan State Pharmaceutical Association two or three years ago, by a well-known pharmacist. In this paper occurred these remarks:

"To what extent are we warranted in selling opiates? Are we justified in endeavoring to increase their sale? Are we true to our conscience when we meet the price of another dealer as represented by the would-be purchaser? It seems to me that the sale of opiates to the debased creatures who have become its slaves is the most disgusting and degrading feature of the drug business, and while I cannot understand how anyone should desire to cater for such trade, I for one am perfectly willing that they should have it. An opium eater is naturally a liar and a thief; you would not dare trust one of them within reach of his or her coveted drug unwatched; their money is hoarded to buy that drug alone; they are outcasts from society; they are beneath the notice of the honest laborer; although themselves possessed of wealth, they are a disgrace to a pharmacy. Sneaks and hypocrites, what have we in common with them? I hear you say, 'but they must have their opium.' Why? Because by the aid of competition, they have been enabled to purchase the drug that has degraded them. Who is responsible for this? Shame upon our profession, it is ourselves, who else sells the degrading drug? Who has reduced the price of morphine from a dollar to forty cents a bottle and opium from seventy-five to twenty-five cents an ounce? Ourselves. Who has reduced the price of laudanum from fifteen to five cents an ounce? Ourselves. Who delivers laudanum unlabeled at request? The pharmacist. Does he do this blindly? No. He knows full well the regular customer, he needs not to ask his wants, the extended bottle taken, filled, delivered without a word, tells only too plainly the miserable pitiful story of a ruined life. For a few paltry dollars reeking with misery and degradation, we have competed as for a prize. It is a disgrace, and a blot upon our escutcheons, placed there by our own hands. We alone are responsible for the enormous sales of chloral, cocaine, opium and its products, and others of their miserable kind, by the pharmacists of the world. We owe it to ourselves to remove the stain, cost what it may. Will we do it?"

The recently proposed potassium permanganate antidote for morphine is coming to be looked upon with increasing suspicion by the medical fraternity, sustaining the position taken by the Era with reference to it. Can it be, as we have seen it hinted, that the discoverer of this wonderful antidote has in contemplation the establishment of a home for the cure of morphine habitues?

NEW CANADIAN TARIFF.

Tariff tinkering seems to be all the rage this year, but our friends of the Dominion of Canada seems to have effected a change on March 27, while we are still talking about ours.

Sulphuric acid has been reduced one-fifth of a cent per lb., and acetic acid, imported for color-making or dyeing, from 20 per cent and 25 per gal. to 25 per cent ad valorem. Acids other than muriatic, nitric, sulphuric, pyridineous and acetic, and employed for medicinal, chemical or manufacturing purposes, are on the free list, and formerly paid 20 per cent. Acid phosphate now pays 2 instead of 3 cents per lb. Essential oils have been reduced from 20 to 10 per cent. Salad oil has been increased from 20 to 30 per cent, but olive oil is free. Vaselin and similar petroleum compounds were formerly charged 4c per lb. in bulk and 6c per lb. in bottles, and are now 35 per cent. Paints, colors, ochres, and oxides have been reduced from 30 to 25 per cent. Varnishes are now 20 per cent and 25c per gal, against 25 per cent and 20c per gal. Spirits of turpentine has dropped from 10 to 5 per cent, and putty from 25

to 15 per cent. Blacking, for shoes or harness, leather dressing and harness soaps are now 25 instead of 30 per cent. Licorice paste formerly paid 2c per lb. and sticks 3c per lb.; both are now included at 20 per cent. Carbolic oil, formerly rated at 10 per cent, is now free, as also tin crystals, which formerly paid 20 per cent. Red and yellow prussiate of potash, charged with 10 per cent, are now on the free list. Saltpeter, previously at 20 per cent; lampblack, at 10 per cent; lead acetate and nitrate and zinc sulphate and other zinc salts, at 5 per cent, have all been put on the free list, as also caustic soda in packages less than the ordinary drums. Crude lime juice is free, as formerly, and if fortified with spirit, also pays the old duty, but unsweetened juice, which was chargeable with 10c per gal., and sweetened with 40c per gal., are now to pay an ad valorem rate of 20 per cent. The duty on spirits and alcoholic compounds has not been changed.

Powdered opium was not previously separately enumerated, and was sometimes imported as a drug, thus paying 20 per cent, or, if brought in as opium, was subject to the charge of 81 per lb. The rate is now fixed at \$1.35 per lb. Beeswax has dropped from 20 to 10 per cent, and paraffin wax has been reduced from 3 to 2 cents per lb. Laundry soap, unperfumed, is now 1c instead of 1½c per lb., and perfumed soaps, with pearline, soap powders, sapolio, silver and pumice soaps, which formerly paid 10 per cent and 10c per lb., now stand at an ad valorem rate of 35 per cent. Glue and mucilage have been reduced from 30 per cent and 3c per lb. to 25 per cent straight. British gum, dextrine and sizing, which paid 1c per lb., are now subject to 10 per cent only.

Surgical Instruments of all kinds have dropped from 20 to 15 per cent. Lamp chimneys are at 25 instead of 30 per cent, and the specific duty of 5 cents per dozen has been taken off glass jars, which, however, still bear, with other glassware, the ad valorem duty of 30 per cent. Plain and decorated earthenware and decorated china and porcelain, formerly paying 35 per cent, are now placed at 30 per cent, and demijohns have been reduced from 3 to 2 cents per gallon capacity.

Printed books—not reprints of British

copyright works, were formerly subject to 15 per cent, and are now to pay 6 per lb. British copyright reprints are chargeable until March, 1886, with an additional 12½ per cent.

THE PATENT OFFICE LIBRARY.

The scientific library of the United States Patent Office at Washington now consists of about 65,000 volumes. As it was designed as a collection for reference in determining the novelty of inventions, it has necessarily grown in the direction of technological publications, including full sets of periodicals devoted to industrial art and treatises on machines, arts, processes and products in the English, French and German languages. Prominent among such works, it contains a series of English patents from their beginning in 1617 to date, comprising upwards of 5,000 volumes of text and plates, a series of French patents numbering about 300 volumes; 800 of German, and complete sets of Victoria, Queensland, Canada, New Zealand, Italy, Switzerland, Sweden, Russia, Austria, Norway, Belgium and Sardinia, each containing less than one hundred volumes, the whole aggregating more than half a million of individual patents. It contains also 1,531 volumes of literature relating to patents, including indexes and abridgments of foreign patents; 1,300 volumes of bibliographical works; 3,000 law books; 500 U. S. publications not of strictly technical character, and about 1,300 volumes of the important English and American reviews. The classes above mentioned, together with encyclopedias of every description, works on pure science, specific and general, and medical works, comprise in round numbers 25,000 volumes; leaving for publications devoted to special arts about 38,000, very nearly equally divided between books and periodicals. The Librarian, in his annual report, from which the above statistics are taken, further says: "Being a government library, of course it has no hope of those bequests and munificent donations which have enriched so many collections. No Librarian of the Department need await with faith and what patience he may command, the good man's end which shall bestow the gift of thousands on his shelves. The government library is supposed to take care of itself; and it does, with difficulties of its own. The boar of the Appropriations Committee doth waste it, and the wild beast of the office doth choke it into dark corners. The arm of the government is over it—with a chastening rod oftentimes."

We are glad to set aside space for Mr. Whitney, of Massachusetts, to enter a rejoinder to the accounts published in our last number of liquor selling by druggists in Westfield, that state. We can hardly admit, however, that we were wrong in our criticism, for, notwithstanding Mr. W.'s explanation, we cannot imagine how it is impossible for any individual to have legitimate use for the quantities of alcoholic beverages which are attributed to some of the residents of Westfield, nor would it seem that Lizzie Borden and Jim Corbett should have the phenomenal thirst attributed to them. The case seems to be Mr. Whitney's statements against those of the Springfield Republican, and "you pays your money and takes your choice."

Written for the Era

PHARMACOLOGY—ITS SCOPE AND THE METHODS OF TEACHING IT.

By J. O. Schlotterbeck, Ph. C., H. B., Instructor in Pharmacology and in Botany, in charge of Materia Medica, University of Michigan, School of Pharmacy.

(Continued from Page 250, March 15.)

It has often been said that costly and beautiful buildings do not in themselves constitute universities or colleges, and the truth of the saying is self-evident. Indeed, if these were true criteria of merit and standing, we could then point with pride to a greater number of excellent educational institutions in this country. The country is annually flooded with pharmacy catalogues, profusely illustrated with cuts of buildings, lecture rooms, and laboratories of various kinds; all of which look well and unquestionably add to the attractiveness of the pamphlet. If we examine the illustrations of some of this literature, we find that many of the appurtenances so essential to thoroughly practical teaching in pharmacy are sadly inadequate and often entirely wanting. For instance; the lecture and recitation rooms may probably have no black boards for class exercises; the chemical laboratories may be insufficient for the continuous work of all students, if they have any at all; and the microscopical laboratory may be furnished with a single table around which all the students are seated, while light, the most important essential to this work, is admitted through one or two small windows in a remote part of the room.

No matter how competent the instructors, one fact remains: thorough and comprehensive instruction in the various studies which constitute a broad course in pharmacy cannot be successfully imparted unless there be ample facilities for the exercise of the students themselves, so that each can by his own work verify the principles enunciated during the lectures. These appurtenances and facilities therefore form an intimate part of the instruction, and as the instruction in pharmacology as given in the University of Michigan forms the subject of this paper, a few words will be devoted to their description.

The laboratory of pharmacology is located in the west room of the museum of the pharmacy building; in several ways an ideal place for the study of crude drugs. Along the sides of the room are spacious, glass wall cases, containing choice collections of crude drugs, distinctly labeled and systematically arranged to admit of easy access and easy reference by the student, for purposes of study and comparison. The method of labeling is plainly seen in Fig. 1, which shows that no labels of any kind are placed within or upon the bottles, but upon the beveled fronts of cherry blocks instead. The pharmacopoeial name, botanical name, and descriptions (when necessary) are all that is placed on the labels. Above the wall cases, and extending to the ceiling are numerous windows admitting a uniformly diffused light, essential to the preservation of such specimens as would be damaged by the sun's rays.

The table was designed for this school without knowledge of any other like it, and admirably serves the double purpose of laboratory practice and the taking of notes during lecture. By noting the position of the students in Fig. 3 it will be

Fig 1.

seen that all students can face the instructor, and that the table is continuous, and assumes the form indicated in the sketch below.

The swinging portion of the table, shown in the lower right hand corner of Fig. 2, permits entrance to the interior, and when closed forms a complete circuit for passing the drugs from one to another. Extending the entire length of the table, and about six inches above it, is a shelf for placing boxes that would otherwise interfere with the passing of the containers.

Now, one of the most important tests applied to drugs for identification is the taste. Some of the drugs, check, while many, if not the majority, increase the secretion of saliva, and it becomes necessary to frequently clear the mouth before testing other specimens. The tables above described contain drawers five feet long, four inches wide and deep, which are cleansed and partially filled with a thick layer of antiseptic sawdust before laboratory work is begun. They are drawn out at the beginning of the hour, and in that position do not interfere with work. They are clean and perfectly odorless, and are a happy substitute for the cuspidore, filthy at best, and liable to overturned.

PROGRAMME OF WORK.

The instruction in pharmacognosy is continuous, and extends over a period of two years of nine months each. The different courses are arranged in their natural sequence. That is to say, those courses are given first which are indispensable for a clear understanding of those which succeed.

During the first semester of the first year the student divides his time between general chemistry, analytical chemistry, theory of pharmacy, and pharmacognosy. This arrangement is all that could be desired. First, general and analytical chemistry supplement each other throughout the entire course. Second, the two conjointly are very beneficial in the study of pharmacy, and all three of them serve to give a clearer conception of the study of that part of pharmacognosy which is under consideration at this time. Third, the pharmacognosy of drug obtained from the mineral kingdom is no small help in general chemistry, and is of decided advantage in qualitative analysis.

The programme of study throughout the college course is as follows:

FIRST YEAR.—FIRST SEMESTER.

Study of dry salts and acids of the pharmacopoeia by recitations and laboratory practice.

From Christmas holidays until the end of the semester, a review of plant morphology.

Fig 2.

SECOND SEMESTER.

Plant anatomy, followed by practical work in the identification of drugs, and the detection of substitutions and adulterations by microscopic methods.

Recitations in Flueckiger's Principles of Pharmacognosy and laboratory work conducted at the same time.

SECOND YEAR.—FIRST AND SECOND SEMESTERS.

Laboratory work, together with recitations upon all the pharmacopoeial drugs as given in Malsch's Materia Medica.

Having practically accepted the definition accorded to pharmacognosy by Martius, viz.: that it should include the study

Fig 3.

of drugs and medicines derived from the three kingdoms of nature, these sources might form the basis of a division of study. The number of drugs obtained from the animal kingdom is very small, however, and they are usually considered along with those obtained from the vegetable kingdom. The inorganic compounds usually kept by the pharmacist, would then form the other division.

Deviating somewhat from this manner of treating the subject, the first course comprehends the study of the solid salts and acids of the pharmacopoeia. This includes both inorganic and organic compounds, and they are considered in alphabetical order in class work.

From the outset to the close of the college course, the development of independence of thought and work among the students is an aim never lost sight of. After all, one of the prime reasons (and by some considered the most important one) for attending college is to learn how to use books, how to study, and therefore how to pursue work after leaving college. Unfortunately, there are some schools that are comparable to the quiz-compend; their main aim being to give as many facts as possible, while they neglect teaching how to connect and utilize them; they tax the brain without exercising it; they are actually injurious to the pharmacist and the profession rather than beneficial.

There are no suitable text-books that could be employed in this work, for they are either too concise or too diffuse, both grave defects. Much has been said for and against the lecture system of instruction, with the majority favoring its abolition under certain conditions. Without the use of text-books lectures should be virtually dictated in order to produce the most satisfactory results. This requires too much time, and the frequent and unavoidable interruptions interfere with the continuity of thought. The student who listens attentively and then goes home and writes up his notes, receives more benefit from a lecture than he who divides his attention between listening and writing down at once, what he has heard. In that part of pharmacognosy under consideration, a happy medium has been sought. A mimeograph copy of a digest of the lecture is handed to each student, who follows the instructor as he logically comments and dilates upon the statements there briefly noted down. The first fifteen or twenty minutes of each lecture hour are devoted to a quiz upon the previous lecture.

PRACTICAL WORK.

A sufficient number of typical specimens is placed upon the table, so that a section of forty to fifty students will have at a given time at least two different specimens before them. The tests to be applied are the color, structure (crystalline or amorphous), odor, taste, density, approximate specific gravity, stability in atmosphere and so on. For some time all jars were labeled with pharmacopoeial and common names, and by applying the above named tests and keeping them constantly before the eyes of the student, they would soon acquire perfect familiarity with the substances. But it was soon found that any peculiarities, as, for instance, an air bubble or a nick in the glass, or the quantity of material in the jar, were unconsciously depended upon for identification of the specimen, be the students ever so conscientious. The absence of independence would show itself

Fig. 4.

when entirely different specimens were submitted for identification. To do away with this difficulty all drugs are placed in jars bearing no mark whatever, and each student is compelled to determine the identity of the specimen by means of a key which was devised as an aid to the study. This key will be published at some future time. It is not intended as a substitute for, but merely as an aid to the analysis of certain drugs, and it also forms an excellent means for self-examination upon the subject.

Tasting of the Drug.—It might be presumed that there is nothing particularly difficult about tasting a substance, and that therefore, no special instructions need be given in that direction. There is, however, opportunity for scientific training of the sense of taste in the identification of drugs. Invariably in State Board examinations the candidates are compelled to transfer sufficient material to the tongue by means of the fingers, and this is also true in colleges where this kind of practice work is required. There is not only contamination upon the fingers and in the specimens, but it is highly repulsive to be obliged to taste of a substance that has been fingered and tasted by numerous other persons. In most cases a minute quantity is amply sufficient to give the distinctive taste is not so active physiologically, and by degrees develops a delicate sense of taste. With this end in view, there is distributed every morning a liberal supply of wooden toothpicks, the very points of which are used for taking up small portions of the substances. The use of fingers is absolutely forbidden, and when crystals or large masses are met, the knife must be employed to remove a small portion of the substance.

Quizzes.—Quizzes are frequently given; every day if possible. Students are called to individual tables, as shown in Fig. 4, upon which are placed numerous two-ounce, screw-cap jelly jars, containing samples obtained from various sources and without distinguishing mark of any kind. In order to overcome the tendency to judge from familiarization with general aspects, rather than from intrinsic features, duplicates of salts and acids

differing in appearance are submitted. Thus, potassium iodide and bromide crystals, both large and small, opaque and translucent, may perhaps be upon the same table. Some freshly crystallized samples of sodium sulphate, zinc sulphate, magnesium sulphate, together with those that have effloresced, potassium carbonate and potassium acetate, both dry and deliquescent; small and large crystals of potassium nitrate; lump and powdered ammonium chloride may also be upon the same table. As fast as the samples are identified, they are placed on strips of paper three inches wide and eighteen inches long, and the pharmacopoeial names written under them.

Examinations.—Test examinations are held at stated times during the semester. The final examination is conducted like those given by the Michigan Board of Pharmacy. An entirely different set of four ounce, glass-stoppered bottles is arranged in groups of four upon the table. Each candidate is abundantly supplied with wooden toothpicks and fresh water with which to rinse the mouth. All begin work at the same moment, and past experience has shown that five minutes is ample time for identifying four specimens and writing down their pharmacopoeial names. At the end of the five minutes all move one place farther, and so on until all have finished. Seventy-five per cent of all the samples must be recognized in order to pass, and since this method has been adopted, not over two or three per cent have failed upon first examination. The final test upon the lecture work is an oral one, and covers the whole subject.

Having successfully completed the work the class now turn their attention to plant morphology. This is review work for the majority and is merely given to form a good foundation for the study of plant anatomy which follows it. Wherever possible, medicinal plants are used for illustration, and especially those commonly known. A large herbarium, charts, and black-board drawing serve for illustrating the text.

(To be continued.)

HOW CHEMISTRY IS BEST TAUGHT.*

By Charles F. Mabery, Case School of Science, Cleveland, Ohio.

The subject "How chemistry is best taught," has a serious interest for all persons who are engaged in teaching chemistry, and it is of especial importance to those who have in charge the preparation of young men for professional employment. In view of the prominence of scientific subjects and methods in the present system of education, it is incumbent upon the adherents of these methods to demonstrate by their results that they are not in error in assuming that science should have an equivalent place with other departments of knowledge. In the higher institutions this question has received a definite answer; in the secondary schools much has yet to be accomplished in the direction of general education as well as in the preparation for higher study.

That the importance of a knowledge of elementary chemistry is apparent to all who are capable of appreciating its usefulness, is evident in the recent extension

*From a paper read before the section of Didactic Chemistry in the World's Congress Auxiliary of the World's Columbian Exposition at Chicago, August 28, 1893. (Reprint from Science.)

of instruction in the secondary schools. In the larger portion of our high schools, however, physical science still occupies a subordinate place, or it is taught merely from text books, with little, if any, laboratory training. Probably the chief hindrance to any radical change is a lack of appreciation on the part of the public. Doubtless the many popular movements of the present day will exert a beneficial influence in extending an acquaintance with the application of scientific principles. I am convinced that the efficiency of higher instruction in chemistry will be greatly improved when students coming to us from the secondary schools shall have had the advantage of practical training in elementary physical science, and I believe this will be the sooner accomplished through a recognition of its benefits in the affairs of every-day life.

I think that we shall all agree that the best argument to be urged for chemistry in any grade of instruction is the value of experimental methods for the development of mental power. This feature should naturally appear with especial prominence in courses leading to the degree of Bachelor of Arts; and, if the schools of science are to be maintained on a higher plane than the trade schools or shops, the courses of study must be conducted with reference to the attainment of mental discipline and scholarship. In the courses of chemistry I am unable to see why this should interfere with the acquisition of practical knowledge.

The guiding star to successful teaching in chemistry is the personality and enthusiasm of the instructor. With the great increase in attendance in many institutions, the earlier relations between student and instructor, which were frequently mingled with deep personal feeling, somewhat akin to veneration on the part of a student, are well nigh impossible. Nevertheless, an enthusiastic teacher with tact and good judgment has little difficulty in maintaining a profound interest even in large classes. In successful teaching we all know how much depends upon the attitude of the instructor toward his students. Courteous relations, with clear understanding that teacher and students are mutually interested in the acquisition of knowledge, readily secure the confidence and esteem of a body of students, and the instruction need seldom be interrupted by questions of conduct. A faithful teacher does not limit his attention to the brighter minds; students slow in comprehension but earnest in application secure a store of information which will be used later to the best advantage. It was a wise teacher who said: "I am faithful in my duty to dull students; in my old age I may need favors of the men of wealth."

In assimilating their methods from European laboratories, the chemists of the United States, untrammelled by traditions and unrestrained by the influence of any particular school, have been in favorable conditions to appreciate the labors of the great masters of other countries. Unfortunately, it may be, in the wonderful development of our natural resources, the temptation to enjoy material benefits may have retarded the growth of original investigation; yet, looking toward the future, the erection of so many large laboratories cannot fail, under judicious control, to contribute to the advance-

ment of knowledge. A marked individuality in our methods is apparent even in a casual inspection of American laboratories. Variation in details is a natural consequence of difference in the temperament of different peoples; and teachers educated abroad have perceived the necessity of adapting the methods in which they were trained to the peculiar conditions.

With some hesitation I approach that aspect of our subject which relates to the details of methods, since the best success in teaching is so dependent on the personality of the instructor that it would seem presumptuous to suggest a rigid scheme for all. There are certain principles at the foundation of successful teaching, however, which may be properly presented for consideration, especially since this paper is intended as an introduction to general discussion. I have already alluded to an unsatisfactory condition in the methods employed in the secondary schools. In some of the high schools, as we all know, there are teachers who are thoroughly imbued with the spirit of scientific study, yet competent teachers are often limited in their efforts by a heavy burden of other work, or by a need of the necessary appliances. There can be no question that the high school courses would be benefited if every pupil received systematic training in elementary physical science, and I believe it is consistent with due attention to other subjects, and that it can be accomplished without any unreasonable pecuniary burden. As an expeditious and effective method for teaching chemistry in the high school, I would have the teacher meet the class before the lecture table and demonstrate, experiment and explain, simply as a convenient mode of teaching classes as one pupil should be taught. The experiments should be repeated by the pupil in the laboratory, under the immediate oversight of the teacher, with the note book close at hand. A text book is necessary, to give information which the teacher has not time to include; but no text book can supply the need of personal teaching. Occasionally teachers with limited knowledge are led to adopt methods of questionable utility by the arrangement of certain text books. Some years since a teacher in one of the high schools in the east, in which little attention was given to laboratory work for students, remarked that his pupils must have a thorough knowledge of valence and structure symbols. The topical arrangement of the subject may be left to the discretion of the teacher, and the quantity to the length of time available; but it should never be forgotten that the educational value of such instruction depends upon the skill in manipulation, of correct habits of observation and in recording notes, and of the true spirit of scientific thought. Whatever of practical information may be included will enhance the utility of the instruction.

In the higher institutions, the first course is general and descriptive chemistry, of which every person who expects to engage in any scientific pursuit should have a thorough knowledge; and, as has been suggested, this subject should have a suitable place in college courses. Concerning details of the most efficient methods in teaching general chemistry, no doubt an extended course of experimental lectures, closely connected with laboratory practice, affords the best training.

The ground can be fairly covered in seventy or eighty lectures, with four to six hours a week of laboratory work, so arranged that the lectures of each week shall include the experiments for the laboratory. Weekly recitations on the subjects of the lectures and laboratory work enable the instructor to control the progress of his students. When students first enter the laboratory it is essential that they be impressed with the necessity of accuracy in the details of experimental work. This important lesson may be easily taught by means of experiments capable of affording quantitative results; by some instructors such experiments are occasionally introduced throughout the course, with the same object in view. There should be sufficient instruction in the laboratory for careful oversight of the experimental work and the note book of each student. Moreover, I am convinced that it is unwise, in any grade of undergraduate study in chemistry, to allow students in laboratories without constant supervision; when left to themselves they are apt to loiter, to contract careless habits and to waste material. Then a laboratory is held responsible for accidents, even though they occur through inexcusable carelessness of students. Every instructor in charge of a laboratory will, no doubt, recall heedless moments on the part of students. Some years ago, just as I entered my qualitative laboratory one day when the assistant was out of the room, I observed a student inflate his lungs twice from a bottle containing a freshly charged solution of hydric sulphide; he immediately fell into the arms of a companion and it was some time before he recovered. Probably another inflation would have proved fatal. This fellow was a sophomore, having taken one year in general and descriptive chemistry; he was fairly bright and had been using the reagent during several months. But some question arose as to the odor of the unadulterated gas, and, forgetting the precepts of his freshman year, he attempted by a direct experiment to ascertain the truth.

What has been said concerning the personality of the instructor applies, perhaps, in a more restricted sense to the student. While methodical habits are to be strenuously insisted upon, the methods may be sufficiently flexible to allow the student to reach his conclusions in his own peculiar way; the particular form of the lecture and laboratory notes, for example, can be left to the preference of the student, provided they are well written and complete.

For other students than those who desire special training in chemistry or allied subjects, an extended course in general and descriptive chemistry provides ample knowledge of this subject. Analytical chemistry is next in the sequence of studies, and for evident reasons qualitative analysis is first undertaken. On account of its great disciplinary value I regard this subject as one of the most important in the whole course of chemical training. It enables the instructor constantly to test the faithfulness and proficiency of the student, and beside the mental discipline, the student acquires a comprehensive knowledge of methods of separation and identification, which is the foundation of quantitative analysis. Elementary theoretical chemistry, of chemical philosophy, may be

conveniently and profitably taught at the same time with qualitative analysis, especially since a familiarity with stoichiometry and chemical reactions is essential in a good understanding of quantitative methods.

Thus far, in teaching chemistry, probably the methods are not materially different in the college and the technical school. Indeed, in the more advanced subjects, the principal difference is in the attention which should be given to the acquisition of practical knowledge in the technical courses. The methods of quantitative analysis are well adapted for the development of skill and dexterity in accurate manipulation, and to the chemist they are indispensable. As a preparation for professional employment the training in methods should be sufficiently comprehensive and thorough to enable the student to appreciate the conditions of any analytical problem; and, further, I deem it of much importance that students have practice, under guidance, in all typical standard methods. It is not sufficient that men are carefully trained in methods which impart skill and accuracy; it seems more desirable, for example, that men who enter the iron and steel industry are thoroughly familiar with the standard methods of iron analysis than to rely upon skill and general knowledge to acquire the special features in actual practice. The first lessons to be learned in the quantitative laboratory are accuracy and confidence; the importance of a close economy of time and effort must be appreciated, and an intelligent student will soon perceive the numerous ways for conducting analytical operations rapidly without haste. When a chemist assumes the duties of a position, every moment has a pecuniary value, and results are demanded in the smallest limit of time. This requirement is sometimes urged in favor of the undergraduate training in rapid methods. While some practice in this direction would, without doubt, be serviceable; but in the three terms at most which can be devoted to quantitative analysis, the time is fully occupied in gaining a familiarity with methods, and in passing from one analysis to another, the conditions are not favorable for commercial rapidity. As in actual practice, it is only possible to attain to the highest degree of celerity and accuracy when the attention of the analyst is limited to a moderate number of determinations which are continually repeated. Experience shows that well-trained students are not long in acquiring commercial dexterity, even to reporting the percentage of carbon in five minutes after a ladle of steel is poured into the mold, or a complete analysis of blast furnace slag within thirty minutes. If attempts were made to give such practice to students, there would still be much to learn in the different conditions in the laboratory of the manufacturing plant.

A branch of our subject which has doubtless occasioned some of us much perplexity in our endeavors to give it a place in an under-graduate course, is organic chemistry. Our difficulty is partly due to the feeling on the part of certain students when they have gained a good acquaintance with quantitative analysis, with the consciousness that they can secure some pecuniary return from their attainments, that they have learned all of chemistry that can be of service to them. Usually such students may be made sen-

sible of their error, although, unfortunately, the importance of a broader view is not always appreciated until a knowledge of this subject is needed in commercial occupation. That organic chemistry is a difficult subject students are not long in perceiving. It is not sufficient in a course of lectures that the principles and methods are understood, they must be learned. The importance of a broad and thorough training in theoretical and descriptive organic chemistry as a part of a chemical education is beyond question. As a part of the preparation for technological and applied chemistry, organic chemistry can most conveniently be placed in the third year; yet without some introduction I have found this subject too difficult for third-year students. The plan which I have adopted with satisfactory results includes recitations in the first term of the third year from an elementary text book, with the following lectures extending throughout the second term and the first term of the fourth year. So far as possible laboratory work should accompany the lectures, although from the pressure of other work the greater portion of the experimental work may be pushed forward into the fourth year. In connection with the lectures students should be required to extend their knowledge by reading, and recitations are necessary to insure faithful application. With this arrangement the principal laboratory work of the fourth year includes organic chemistry and chemical technology, assaying, gas analysis, and such other subjects as may seem expedient can be provided for here. Lectures in metallurgy are of advantage to students in chemistry, and they may be attended during this year; some additional instruction in theoretical chemistry can be given with profit.

For the utilization of chemical skill the field of manufacturing or applied chemistry is full of promise, although in this country it has largely to be developed. Suitable preparation for industrial occupation demands thorough training in the direction already suggested, and beside, a good knowledge of technical processes with the aid of laboratory work, so far as it is feasible to experiment with these processes on a laboratory scale. Concerning the best methods for teaching this subject, no doubt courses of lectures, supplemented by reading are to be preferred, especially if part of the lectures can be given by persons engaged in professional pursuits. Several recent compilations, in a convenient form for the use of students, are a valuable aid.

The range of laboratory work is, of necessity, somewhat limited; it must consist principally in the preparation of chemical products from crude materials, in the study of mordants, and dyes, and in testing the efficiency of certain features of industrial processes on a laboratory scale. The preparation of these or written accounts of various processes should also form a prominent feature of a course in technological chemistry. Institutions fortunately situated near manufacturing establishments, afford valuable opportunities to students who are enabled to study industrial methods in actual operation. Such instruction, supplemented by laboratory practice, constitutes the best possible method of education in applied chemistry that an institution can provide.

Any discussion of the details of a chemical education must be incomplete with-

out some reference to related subjects, either such as are closely allied to chemistry, or those which are essential in the proper mental development of every well-educated person. Evidently this portion of our subject may be considered from more than one point of view. In a course of four years in the school of science, there should be a thorough training in mathematics, so far as calculus, and it may be no disadvantage to make a certain portion of this subject required or optional. Every chemist who aspires to a position beyond that of an analyst will be called upon to plan and oversee the construction of appliances and buildings. In fact, ingenuity and mechanical skill may occasionally be as serviceable as chemical knowledge. There are, therefore, good reasons for the requirement by every student, of a good understanding of mechanical drawing and of elementary mechanics, and this may have led to the foundation, in several institutions, of a course in chemical engineering. No doubt this course is in demand by persons who desire proficiency in the engineering features, but students who expect to engage in applied chemistry can hardly afford to omit any portion of the undergraduate training in chemistry. Nothing need be said as to the importance to all chemists of a thorough discipline in descriptive physics with laboratory practice. A familiarity with the principles of heat and electricity and with the manipulation of electrical currents are among the more important requisites. The rapid growth of electro-metallurgy indicates large possibilities for the application of electrical energy in this form, and it can evidently best be undertaken by the chemist who possesses a good knowledge of electricity. The literary training in scientific courses is usually limited to the English branches and the modern languages; without a certain acquaintance with the latter the chemist would be seriously restricted in the sources of his information, and, moreover, to scientific students, it would seem that the French and German languages should be taught as much, at least, for mental discipline and for culture as for their practical usefulness. Of the importance of thorough discipline in the English language and literature, history, logic and political economy, it is not necessary to speak. Determinative mineralogy may be provided for in the second or third year. Courses in agricultural or pharmaceutical chemistry, or in other special fields, should differ in the details of the third and fourth years from the course outlined above.

In college and university courses, theoretical chemistry and chemical literature receive more attention, and in general less attention is given to practical applications. I do not accept the idea sometimes expressed, that original investigation should not be attempted outside of the university. We are all too well aware of the difficulties in the way of carrying on special study in connection with the responsibility of undergraduate courses; and yet I am sure we appreciate the influence of such work in the atmosphere of the laboratory as well as upon the instructor himself. Then there are always in the laboratory bright students who are able to undertake with profit the study of special problems. As a part of the preparation for teaching I look upon a certain acquaintance with the methods of original research as an essential attain-

ment; I do not intend to assert that without it there can be no good teachers, but it certainly strengthens the equipment of a teacher who aspires to a high position.

Earlier in the paper I endeavored to give an outline of what seem to be the principal objects to be kept in view in teaching chemistry as an educational subject. Students continue in chemistry with the intention of securing professional employment either in teaching or in applied chemistry. How often are we met with the question as to what is the prospect of employment after graduation; whether the inducements are more promising in teaching or in practical fields. Concerning teaching as a profession, the reply is easy; a person with an aptitude for teaching and with a broad training has little difficulty in securing a position commensurate with his attainments, especially at present, with the wonderful extension of our educational institutions. But the number of positions is limited and there are few vacancies; if they were abundant not all persons, even with the best possible preparation, would succeed in teaching chemistry. In applied chemistry the conditions are not the same.

With our enormous stores of natural products yet undeveloped, vigorous enterprise in business operations and great industrial wealth, there cannot fail to be rapid development in the fields of manufacturing chemistry. Within the ten years just elapsed, we have witnessed great changes; manufacturers, who, ten years ago, conducted their operations almost without the aid of chemical skill, now employ several chemists. Eight years ago I visited a large plant for the manufacture of sulphuric acid, which contained neither a Glover nor a Gay Lussac tower. Further improvements, which are necessary for the production at home of chemical products that are now imported in large quantities, require broad qualifications with extended experience; if our graduates are not sufficiently well trained, chemists will be secured elsewhere.

If there are portions of the educational field in chemistry which appeal to us with greater force than others, perhaps the elementary teaching in the secondary schools and the advanced study in preparation for teaching or for positions requiring independent skill and originality in methods are worthy of attention. The recent growth of knowledge within special fields has introduced new features into methods of instruction. In addition to courses which are adapted to all students, those who intend to undertake investigations in any particular direction should have training under the guidance of a specialist in that field. There are many economic problems of the utmost importance awaiting solution, which require not only the application of all accumulated knowledge, but the discovery of new methods. The maintenance of a healthful water supply and the economic disposal of sewage are serious problems for the present generation, and the engineer must be aided by the best skill of the chemist and of the bacteriologist.

Every laborer is directly interested in the promotion of investigations on an economic and healthful food supply. To the great army of workmen who are struggling to support families on incomes of three or four hundred dollars a year it is a matter of serious importance to secure the best nutrition at the smallest

cost. Yet it is rarely, if ever, that a judicious selection of food materials receives attention; it is usually a question of individual taste, so far as the means at hand will permit, with a complete ignorance of any principles of economy or health. In these directions and others of no less importance there are great opportunities in the domain of sanitary chemistry to render inestimable benefits to humanity.

What has been said of sanitary chemistry applies with equal force to medical chemistry, to agricultural chemistry and to other special fields. But I feel sure that the details of methods of instruction, as well as a consideration of methods based on other recent discoveries, such as the use of models in teaching structural chemistry, can best form a part of the general discussion by teachers who are especially occupied in those particular fields. Perhaps, also, the great border land between chemistry and physics, or chemical physics, should receive attention from those whose investigations are extending our conception of the fundamental principles of chemistry.

[Written for the Era.]

AMATEUR PRESCRIBERS AND DRUG PEDDLERS.

By S. P. Whitmarsh.

In searching for the causes that in these latter days are gradually lessening the legitimate profits of druggists, one needs to look beyond cut-rate stores, physicians' supply houses, grocers' competition and the like antagonistic agencies. They are the open and avowed competitors of the regularly registered druggist, and have been cursed and discussed both singly and collectively, from every point of view, by members of the profession. Concerning the injury they are doing and the plans likely to prevent it, nothing more can be said. Under our peculiar type of civilization all conditions of business or professional life are subject to changes quite difficult to understand, and alike impossible to resist. In the struggle of the fittest to survive, however, it is the hidden elements that often exert the most powerful influence for good or evil on each class of humanity struggling to reach a higher stage of development.

There was a time in the history of pharmacy when, although the ranks of the profession were not recruited by a forced hot-bed growth in special schools as at present, the wants of the community were no doubt quite as well supplied, and by men fully as well prepared to meet all the requirements of their calling. They had some standing then in the public estimation, as those who knew at least a part of the dark secrets of nature's laboratory, and whose opinions and advice on matters collateral to their profession were eagerly sought and confidently relied upon. But the intellectual developments of the last half century have changed their relative position with the public. By degrees that public has been growing somewhat acquainted with the secrets both of commercial and professional life; and, as usual, this has verified the old adage that "a little knowledge is a dangerous thing." Not necessarily dangerous in this case to those who only half know, but because of half knowing what they choose to believe of the estimated profits of druggists, they assume to charge them with extortion in prices.

This feeling has grown up from little

jabes and sarcastic flings at the immense percentage of profit supposed to be made on some special prescriptions, as though, whatever it might be, that was a rule by which to compute the average receipts. But jokes sometimes lead to practical earnest if persisted in too frequently. Still, joking of itself need not disturb one's equanimity, were it not connected with other considerations that furnish a natural sequel. The price lists of all commercial men were once considered almost as much a guild secret as the record of personal expenses is to the individual. But the boasted freedom of an independent press reaches now to the remotest detail of business as well as family affairs. To-day nothing is unknown to anyone who reads the papers and allows his curiosity full play. People know more about what wholesale prices are nowadays than the merchant himself did fifty years ago, under the peculiar system of finance then existing. They know just enough to make rash estimates leading to false conclusions about those whose actual circumstances they can never understand. In a desire for retrenchment they study prices hastily, and compare them without judgment, thus giving verdicts that are in the main both partial and unjust.

One of the new fangled economies of a not remote period is treated of in a book entitled "Every Man His Own Lawyer." Apropos to this our forefathers had a pithy saying that "he had a fool for his client." At the same time the country has been flooded with other works which furnished information enabling every man to be his own physician. When the public mind had become fully saturated with these economical methods, it was further supplied with an infinite variety of receipt books that claimed to include all knowledge under the sun, but, principally, formulas that instruct how to compound family remedies at the least cost; and thus it became possible to compile another valuable and crowning work called "Every Man His Own Druggist." Now, when a man can save attorney fees by carefully studying the first volume, and qualifies himself to diagnose the most of his own and family's ailments by means of the second, he is prepared to compound, at the minimum of cost, the necessary remedies by following the plainly printed recipes contained in the third.

Very few, perhaps, themselves choose to compound and administer any but such simples as can be easily thrown together. But in cases of sickness which they intend to treat by the book they sneak past the doctor's residence and tender to the bewildered druggist a copy of some favorite formula scrawled in pencil on a waste fragment, that, if readable in spite of bad orthography, violates all the rules of logic by making the less contain the greater, or the law of therapeutics by having no relation to the disease, or the law of pharmacology by attempting to join incompatibles. Besides these puzzling features there is nothing on its face to show whether the drug called for is a liquid, whether it is solution, elixir, or extract. One might follow instructions if the written document could make it clear whether bark, root, leaf or berry of the drug was intended, and, if so, how much of each. The impatient customer wonders why a skilled pharmacist, who is able to read the Latlized hieroglyphics of a regular physician, does not easily compre-

hard plain English. While he watches the druggist's uncertain movements, he kills time by computing with the aid of his wholesale price list what the prescription ought to cost, so as to be able to contend for his rights in case the knight of pestle and mortar should attempt the uncertain compound and charge in addition according to the brain labor involved.

The compiler of these formulas that so often puzzle the most skillful druggist may or may not be regularly educated in medicine or pharmacy. Though sometimes he may write "Dr." before his name, he evidently shows a bitter dislike to the medical profession, as well as druggists, and never spares a fling whenever opportunity occurs. At all events he glories in being independent of everything that would connect him with the scientific thoughts of the age, as based on practical research or crucial experiment. Instead, he claims to have cut loose from what he calls the bigotry of the schools and substitutes the "go as you please" style both in diagnosis and dispensing. In fact it is hard to tell where the former ends and the latter begins. But both are distinguished from that of the schools by lacking clearness of statement as to symptoms and definiteness as to quantity and quality of remedies. Quite a large proportion of the formulas considered especially valuable are acknowledged to have been procured by underhanded means from regular pharmacists and reclothed in different language—as a horse-thief often shaves mane and tail of his living plunder to escape detection. And, indeed, as printed such recipes are so well disguised by crudeness of expression that the original owner could never identify them. The signs and abbreviations used in legitimate pharmacy are carefully avoided, probably for a similar reason.

The editions thus prepared constitute the entire education of a certain class who graduate by sheer force of gravity from this their only medical and pharmaceutical alma mater. A part, having sufficient capital, enter into business as jobbers of specialties, distributing wares up like patents, but having no retail price affixed to label, only to grocers and general dealers. Another class become retail drug peddlers and visit every rural district, lavishing the information and remedies so cheaply and easily obtained on all who can be persuaded to take the word of a stranger at its face value, and pay for drugs twice what is usually asked for honest goods at regular stores. While the varieties carried consist mainly of essences, extracts, liniments, ointments, etc., the strength and purity of which vary according to the avarice of the seller, they are supposed to cover the whole catalogue of human ailments and be more effective than the largely advertised medicines prepared by scientific chemists. Many of the maladies that they claim to cure, as expressed in the language of these canvassing druggists, have not yet been recorded in any medical treatise. An occasional use of a compound dislocation of an English word, interjected while volubly discoursing on the merits of some special remedy, has more subduing influence on certain rural patrons than twice the amount of orthodox Latinized diagnosis; and generally affects the hearer to such an extent as to seldom fall in securing a sale of the medicine prescribed.

Next appears upon the scene another

class of drug peddlers that combine the advantages of organization with a free hand, free concert or dramatic entertainment, free medical advice, etc.—in fact everything free but the medicine and the customer, both of which are very much sold. These are no one-night stands either. In tent or hall, the public flock night after night to be amused by the antics of aborigines in war paint and feathers or bums from some broken down variety show. At the close of each performance a medical lecture is given in auctioneer style by a big, long-haired Indian dressed in store clothes, who claims to know more of the secrets of healing than his white brother, and who invites all unbelievers to make an investment in his valuable compound. The game, halt and blind respond freely. While the lecture is kept up the virtues of such medicines seem to be miraculous, but in the words of an ancient ditty:

"When the play was ended,

They down the stage did fling;

And there was no difference in this thing:
Betwixt the hegar and the king."

When the last vehicle bearing the troupe to pasture new is lost to sight by the roundness of the earth's surface, it is evident that the virtue of their medicines has departed; and every victim of emotional insanity comes to his senses with an aching void in his exchequer.

Like machinery without a balance wheel, their medicines have no force inherent to overcome the inertia of doubt; and so require the continuous pressure of solicitation to insure sales. Working more on the imagination than bodily infirmities, when the adjuncts of stage excitement are wanting, the faith of each patient falls fluttering to the ground. Methods like those described have lessened and are still lessening public confidence in all honest remedies kept by regular druggists, and prepared from written personal examination made by skilled physicians of each case. I have no doubt the grievances the latter claim to have suffered from the drug trade have been indirectly caused by the too willing efforts of druggists to handle such remedies as have no merit but a demand made by advertising.

How long this condition of things is going to last no one can reasonably conjecture. In the very nature of human experience there must come a reaction. This the alert pharmacist should strive to anticipate and encourage so far as his personal influence can go by refusing to deal in goods known to be compounded by ignorant pretenders. By never-failing courteous treatment of the medical fraternity he will gradually overcome all reasonable complaints they may make of his having trespassed on their professional limits. Physicians and druggists have many interests in common. Neither can afford to allow jealousies to weaken the entente cordiale without which both lose their influence with the public and a large share of legitimate profits.

SALOCOLL.—Phenocoll Salicylate. The salicylate of this well-known remedy, phenocoll, which has been employed chiefly as hydrochloride. The after effects produced by the soluble salts of this base are absent in this, probably because of its insolubility; mild and reliable antipyretic, anti-neuralgic. In doses of 1 to 2 gms. several times daily. Specific in influenza.

PHARMACY.

BAY LUM.—Mix 2 drams oil of bay, 20 minims oil of pimenta, 2 drams carbonate of magnesia and 2 pints each of alcohol and distilled water. Filter.

DANGEROUS "DIABETIC" FLOURS.—containing as high as 66 per cent of starch, and yielding the same amount of glucose as wheaten flour, are to be found in the market.

A **DIPHTHERIA CURE** has been discovered by a Milan chemist named Barcolomeo, so he claims, and he wants the Paris Academy 50,000 francs prize for doing it.

LEAD POISONING may be prevented to a great extent by those who handle white lead, by washing frequently in a decoction of oak bark, and by taking care to rinse out the mouth before eating. Milk should be drunk frequently, but intoxicants should be left alone.

CHLOROFORM.—Anschuetz proposed the preparation of a pure chloroform, based on the fact that it combines with salicylic (dehydration of salicylic acid) forming an insoluble crystal compound:

with 33 per cent of chloroform; stable when kept in closed vessels; on warming, chloroform is liberated.

ALUMINUM FOR SURGICAL INSTRUMENTS is not meeting with quite the success predicted, for those who have used such instruments claim that, though they do not oxidize, they are deficient in elasticity and stay bent after pressure. One physician objects to their lightness on the ground that he is made to feel that he can put no trust in them when in use, as he likes to feel that he has hold of something when using an instrument.

THE PURIFICATION OF SEWAGE at Havre, France, by electrolyzed sea-water, recently described in these columns, is now reported to be so successful that when the refuse is drained into the street gutters, not only is there complete absence of all disagreeable odor, but the gutters, which formerly were black and stoned, have been beautifully bleached, even the curbs and flagstones becoming nearly white.

THE GRUB AND ITS GRUB.—B. S. Proctor writes to Chem. & Drug, that he has found a cream-colored grub living in sugar of lead, and he expresses some curiosity to know what the grub lives on. The writer describes it as measuring about half an inch in length by a little more than one-sixteenth of an inch in diameter, and its head suggestive of shellac, its body of cold cream, and its legs like so many Whigs and Tories going off in pairs for a lazy time, when its tail drags on like the end of the session.

SOLID EXTRACTS which are habitually ordered in connection with ointments are best kept on hand in the form of glycerites. They are fitly prepared by bringing together equal weights of extract, glycerin and water, and after effecting thorough mergence, evaporating the water by heating the mixture on a water bath until its weight equals that of the extract and glycerine combined. They are also especially useful in the formation of pills. As the strength is reduced one-half, double the quantity prescribed must be used.—Beginnings in Pharmacy.

HAIR TONIC.—A contributor to one of our medical exchanges plus his faith to the following as an infallible preparation to arrest the falling out of the hair: $\frac{1}{2}$ drams each of tincture of cantharides and tincture of nux vomica, 10 drams tincture of cinchona, 1 to 2 ounces of glycerine, with enough alcohol to make 1 pint, using a little essence of heliotrope to flavor. This preparation is to be applied to the scalp by vigorous rubbing once a day.

PHENOL SODIQUÉ.—G. M. Beringer says that the following formula will give a preparation very similar to the proprietary article: 120 grains of caustic soda are dissolved in 4 ounces of warm water, 2 troy ounces coal tar added, and the whole vigorously shaken for a few minutes. Then enough more water to make 19 fluid ounces is added, the mixture set aside, covered, in a warm place and shaken vigorously during a few days, then decanted and filtered.

EAU DE BOTOT.—A somewhat interesting trade mark question, says Chem. & Drug., is likely to arise concerning the use of the words "Eau de Botot." For a long time past any pharmacist or manufacturer has considered himself entitled to adopt the name for a dentifrice, of which the ingredients are well known, and it had apparently become public property. The preparation was invented more than a century ago, and it is only now that the company trading under the name of Botot claims for itself the exclusive right to the appellation.

AROMATIC WATERS.—M. A. Miner objects, in the Apothecary, to the directions given by the new pharmacopœia for making aromatic waters. He likes the process, but thinks it necessary to increase the quantity of precipitated calcium phosphate employed. Instead of only 4 grams to each 2 c. c. of volatile oil, there is needed about 20 grams. When the smaller amount is used, trituration with the oil produces a pasty mass which is not satisfactorily acted upon by the water. Enough of the phosphate should be used to form with the oil a mobile powder, which mixes easily with the water, without separation of oily particles, and produces a satisfactory product. The mixture should be shaken frequently and thoroughly before filtration.

GOOD SODA WATER.—For a goodly share of his success in the soda water line, D. S. Carraway tells Merck's Market Report he is indebted to the following points: For filling his fountains he uses pure, cold, distilled water from the ice factory, and charges them while the temperature of the water is still below 40° F. In each 10-gallon fountain he puts $\frac{1}{2}$ ounces each of sodium bicarbonate and alcohol, which give a beautiful effervescence and body to the water when drawn. These fountains are then carefully charged to a pressure of 160. The advantage of using the cold water is that it absorbs many times its volume of carbon dioxide, and the beverage when drawn is delightfully light, airy and pungent.

METALLIC PAINT.—Aluminum, when reduced to powder and mixed with a solution in water of gum-lac, gives a metallic paint which covers well and may be shaded with aniline colors dissolved in water. The solution of gum-lac is made by bringing to boiling point a mixture of gum-lac

and borax and an alkali, such as soda or ammonia. The solution must contain at least from 15 to 20 per cent of gum-lac. Aniline colors are added to produce the shade desired, and aluminum is added in sufficient quantity to produce a paint sufficiently fluid for application with a brush. The color is brilliant, very durable and impermeable, and may be applied to metals, paper, wood and woven materials. It may be rendered supple by the addition of a small quantity of glycerine.

THE PHARMACISTS' CODE OF ETHICS.—E. H. Gane read an interesting paper before the January meeting of the Chemists' Assistants' Association of London, entitled "A Suggested Ethical Code for Pharmacists." After dwelling at length upon a voluntary code, he presented a compulsory code which is summarized thus: A pharmacist guilty of any of the following acts and violations is to have his name erased from the register of chemists and to be stigmatized as guilty of disgraceful conduct. 1. Wilful adulteration of drugs or medicinal preparations. 2. Conviction for criminal offenses. 3. Wilful tampering with the prescriptions of physicians. 4. Wilful non-observance of the laws relating to the sale of poisons. 5. Covering unqualified persons or lending his name or services to any company formed for the purpose of evading the requirements of the pharmacy act.

PURIFICATION OF RESIN.—One process consists of melting the resin and passing through it a current of chlorine gas, acidifying with sulphuric acid, washing with boiling water, and finally with hot water containing nitric acid. Another process consists of melting and then boiling the resin with a saturated solution of salt. After boiling for some minutes in a solution of chromic acid or a solution of bichromate of potash with twice its weight of sulphuric acid, it is washed with a slightly ammoniacal water. Another method consists in heating the resin with a mixture of chalk, dioxide of manganese and potassium bichromate, and filtering through sand. Heating with powdered zinc, with or without sodium bisulphate, has also been suggested. Sulphuric acid and zinc chloride at high temperatures have also been tried. Seemingly the best process consists of first filtering to separate insoluble matters and dirt, then heating to about 150° C., with 5 per cent of zinc chloride for an hour or two, and then adding 12 per cent of bichrome in the form of a powder. After sufficient heating, the mass is allowed to cool down to 100° C., and is filtered. Lastly we have to mention purification by anhydrous sulphuric acid with heat under pressure, in a sheet-iron cauldron, which can be heated by superheated steam and fitted with a cover capable of resisting a pressure of 5 kilos. to the cubic centimeter. In this 100 kilos. of the resin to be purified are placed, heated to fusion, the pressure raised to 4 kilos., and the sulphuric acid added. The whole is heated to 100° C. for an hour, when it is left to cool, and washed with boiling water. The sulphuric acid process and the zinc chloride process are often worked in conjunction with each other.

SEDATIN.—Para-valeryl-amido phenol. A patented sedative made by reaction between para-amido-phenol and valeric acid. Dose not given.

NEW REMEDIES.

IODO-CAFFEINE.—A compound of caffeine with sodium iodide; unstable, hot water is sufficient to decompose it.

IODOL CAFFEINE.—A crystalline compound formed by the action of iodol on caffeine. Inodorous and tasteless; recommended because of its greater stability than iodol.

ALUMINOL.—Aluminium salt of naphthol-sulfonic acid. A fine powder, very soluble, employed for antiseptic dressings; non-poisonous when employed externally; dissolves in purulent discharges, hence does not stop up wounds.

SODIUM PEROXIDE.—Employed as bleaching and oxidizing agent; yellowish powder, very soluble in water. In contact with water, oxygen is disengaged; with dilute acids it forms hydrogen peroxide; of course the liquid must be well cooled. Contains 20 per cent active oxygen.

RUBIDIUM IODIDE.—The Stassfurter potassium salts furnish the source of this base. The iodide is offered as a substitute for the corresponding potassium and sodium salts; inodorous white crystals; milder taste; permanent in air; more soluble than KI; free from the disturbances produced by the potassium base KI.

XYLENOL SALOLS.—Made by the action of dehydrating agents on a mixture of salicylic acid and xynol, yielding ortho, meta and para salicylate of xynol. Physically and chemically resembles the well-known salols, insoluble in water, alcohol and ether; without any noticeable taste or odor. Employed as intestinal infestants.

GALLANOL.—An anilid of gallic acid; obtained by heating aniline and tannin together. Forms colorless crystals, bitter taste; very slightly soluble in cold water, more so in hot water and alcohol. Employed as a substitute for pyrogallol in psoriasis, and has the advantage of being non-poisonous and non-irritating. In ointment, 10 to 20 per cent.

FORMANILID.— C_6H_5NHCOH . Prismatic crystals, very soluble. In hypodermic injections of 3 per cent solution acts as an antiseptic. A 20 per cent solution, when applied to the tongue, produces long numbness. Sprinkled upon bleeding wounds, it stems the flow of blood better than antipyrine. As an anodyne the maximum dose is 0.5 gm.

CHLORALOSE.—Anhydro-glucio-chloral. Prepared by Harinot from anhydrous chloral and glucose; crystalline, sparingly soluble in cold, and very soluble in alcohol and hot water. Hypnotic action greater than chloral, showed no toxic properties. Dose of 0.5 gms. produced deep and quiet sleep in individuals who were not affected by other hypnotics. Its solution is very bitter; best given in capsules.

MERCURY GALLATE AND TANNATE.—Mercuric gallate is prepared by precipitating a solution of mercuric acetate with gallic acid, yielding on drying a brownish powder. Mercurous gallate is prepared from mercurous nitrate and gallic acid, and yields a dry, greenish powder. Tannate of Mercury—76.2 gms. tannin is triturated with 25.7 gms. yellow oxide of mercury and 50 c. c. of water; when dry is olive green. Both are employed as antispasmodics. In form of pill, combined with extract cinchona. Daily total dose, 0.1 to 0.2 gms.

FORMULARY AND QUESTION BOX.

The object of this department is to furnish our subscribers with reliable and tried formulas and to discuss questions relating to practical pharmacy, prescription work, dispensing difficulties, etc.

Requests for information are not acknowledged by mail and ANONYMOUS COMMUNICATIONS RECEIVE NO ATTENTION. To insure answer in the next number, queries should be in our hands ten days prior to the date of issue.

6092. Prescription Query.

(G. E.)—Referring to the prescriptions in the March 15, 1894, Era, A. Rosenwald, Chicago, Ill., submits the following procedure in compounding:

(1)
Zinc oxide..... 2 drams.
Zinc carbonate, precipitated 1 dram.
Petrolatum..... ½ ounce.
Solution of lime, enough
to make..... 4 ounces.
Triturate the zinc oxide and zinc carbonate with the petrolatum, then gradually add the solution of lime, making an emulsion.

(2)
Carbolic acid..... 2 ½ drams.
Extract opium..... 2 drams.
Olive oil..... ½ pint.
Rub the extract of opium, small quantities at a time, with the olive oil. Then add the carbolic acid.

6093. Effervescent Bromide Compound.

(Subscriber)—See No. 5812, page 548, Dec. 15, 1893, Era.

6094. Sweetening the Peet.

(E. E. D.)—See No. 3853, Jan. 1 Era, page 13.

6095. Liniment.

(J. F. P.)—We cannot give the formula you desire. Why not try some of the formulas for liniments given in the National Formulary? See also March 1st Era, page 210.

6096. Thymoline.

(R. S. C.)—The manufacturers of this preparation send us literature which states that Thymoline is an antiseptic compound, each fluid ounce of which contains ½ grains thymol, ½ grain menthol, ½ minims each oils of eucalyptus and cinnamon, 4 grains benzoic acid, 15 grains boric acid and 1 dram peroxide of hydrogen.

6097. Photographic Developer.

(H. D. A.)—The best way for you to gain a knowledge of the developer for the films used in the Eastman Daylight Kodak is to prefer your request directly to the Eastman Company, Rochester, N. Y. Every photographer has his particular and favorite developer, and manufacturing and supply houses recommend developers with particular reference to the nature of the work to be done.

6098. Expectoant.

(F. K.)—We cannot give you the formula for the proprietary article you name, but you will find a number of excellent ones for cough preparations and expectoants in general on page 308 of our last issue. Very frequently formulas for cough mixtures have been published in the Era, and you should have no difficulty in selecting one which will be thoroughly satisfactory.

6099. Flavoring Extract of Rose.

(Subscriber)
(1)
Red rose leaves..... 2 ounces.
Oil of rose..... 1 dram.
Alcohol..... 2 pints.
(2)
Deodorized alcohol..... 500 parts.
Proof spirits..... 300 parts.
Extract of rose-geranium 100 parts.
Oil of rose..... 5 parts.
Magnesium carbonate..... 5 parts.
Color with tincture of alkali.

6100. Sticky Fly Paper.

(A. H. H.) The ordinary method is to paint heavy, unstized manilla paper with common glue, using an ordinary flat paint brush, and allowing to dry. Then follow with one or two coats of the following mixture, made by melting over a gentle fire, stirring constantly: Castor oil, 4 ounces; resin, 12 ounces. Another mixture which may be spread upon paper prepared in the same way is: Castor oil, 8 ounces; resin, 21 ounces; sugar, 4 ounces.

(2)
Gum thus..... 4 ounces.
Linsed oil..... ¼ ounces.
Honey..... 1 ounce.
Melt and mix well, spread over sized paper when hot.
See also Era August 15, 1893, page 158.

6101. Ichthyol and Hydrastine Sulphate in a Prescription.

(C. E. M.)—
Ichthyol..... 2 drams.
Hydrastine sulphate..... 30 grains.
Aqueous solution cubeba 3 ounces.
Solution ammonium acetate..... 3 ounces.
Tincture nux vomica..... 3 drams.

We find upon trial that a clear solution cannot be made. The hydrastine sulphate is insoluble in the solvents of the mixture. The prescription should, if dispensed at all, be sent out as a shake mixture. Under various modifications it has been given the rounds as an alleged cure for the liquor thirst and drink habit. If of any index of its value and usefulness, it must be truly valuable.

6102. Tincture Guaiac and Mucilage of Acacia.

(E. E. D.) asks if a clear mixture can be made from the following:

Mucilage acacia..... ½ ounce.
Tincture guaiac..... 1 ounce.
Compound tincture cinchona, enough to make..... 4 ounces.

No. The mucilage is incompatible with the tinctures. Why not omit it and dispense the mixture under a shake label?

6103. Stain for Violets.

(M. McD.)—To darken the wood, rub over it nitric acid, sp. gr. 1.2, and after standing 12 hours, wash and dry thoroughly. Then use either of the following: (1)

Prepare a groundwork with a strong, hot, aqueous solution of logwood extract; then apply a solution of 3 ounces potash, 3 ounces red sanders, 2½ pounds gum shellac, and 1 gallon water, dissolved over a quick fire.

(2)
Boil 1 ounce logwood extract in 1 pint soft water, and add about 2 drams of cream tartar. Use the stain hot, and give several coats if necessary, drying between each. Use a saw-edged graining brush and asphaltum varnish, sufficiently thinned, to produce the proper markings.

6104. Tasteless Syrup of Quinine.

(A. A. S.)—Try the following:
Quinine sulphate..... 1 dram.
Cinchonine sulphate..... 1 dram.
Sulphuric acid, q. s.
Oil of orange, q. s. to flavor.
Saccharin..... 4 grains.
Alcohol..... 1 ounce.
Glycerin..... 1 ounce.
Syrup, enough to make, 8 ounces.

Dissolve the quinine sulphate and cinchonine sulphate in 4 ounces of the syrup by means of sulphuric acid. Dissolve the oil of orange or other suitable flavoring, together with the saccharin, in the alcohol and glycerin, add to the quinine solution with enough syrup to make the mixture measure 8 ounces. See also reply to query No. 5777, Dec. 1, 1893, Era, page 501.

6105. Embrocation.

(Ret)—The Pharm. Ztg. gives this:

(1)
Oil of amber..... 4 parts.
Oil of cloves..... 4 parts.
Olive oil..... 15 parts.
An English formula reads as follows:
(2)
Olive oil..... 20 parts.
Oil of cloves..... 10 parts.
Oil of amber..... 10 parts.

(3)
Asafoetida 2½ drams is digested with 8 fluid ounces of olive oil for several hours. The clear solution is decanted and mixed with 2 drams each of oils of caraway and turpentine, and a few drops of gaultheria.

6106. Bismuth Subnitrate and Syrup of Hydriodic Acid in a Prescription.

(C. A. L.) says in mixing bismuth subnitrate with syrup of hydriodic acid a black mixture was obtained. In using another make of syrup of hydriodic acid, an orange-colored precipitate was obtained, which, upon standing, became black as in the prior instance. What is the cause of the reaction, and what causes the difference in color? Bismuth iodide of variable composition is formed. This is shown by the color changes noticed, the composition of the iodide varying from a light yellow to a dark, dirty brown color. The reaction may possibly be modified by the presence of glucose or other reducing agent, sometimes added to the syrup.

6107. Prescription Query.

(Subscriber) asks what reactions occur when the following prescription is compounded:

Potassium chlorate..... 2 drams.
Tincture ferric chloride..... 3 drams.
Dilute muriatic acid..... ½ dram.
Solution ammonium acetate..... 1 ounce.
Syrup of lemon..... 1 ounce.
Water, enough to make..... 4 ounces.

Several reactions are likely to occur, depending upon the order in which the various ingredients are put together. In whatever way combined there is an evolution of free chlorine produced by the action of the hydrochloric acid upon the potassium chlorate. The writer of the prescription has prescribed more potassium chlorate than can be held in solution in the solvents of the mixture, quite an appreciable amount of it settling to the bottom of the bottle upon standing.

6108. Arsenic Wafers.

(H. D. A.)—We do not believe in the use of arsenic or other potent substances, except under the advice and watchfulness

of a competent physician. For this reason we object to the preparation mentioned, or any others claiming to contain arsenic (it being immaterial whether they do or do not). We have seen statements with reference to this particular article that there is not enough arsenic present to cause any results at all, to say nothing of injurious ones, from its continued and excessive use. We are told that each wafer or triturate contains in the neighborhood of 0.001 grain of white arsenic, with sugar of milk as the vehicle. We are opposed to preparations of this nature and to all which have no real intrinsic value.

6109. Coloring Benzine and Kerosene.

(F. E. L. and F. K.)—Kerosene and allied petroleum products, it has been stated in print, may be colored by alkanet root, but some experimenters report very unsatisfactory results. We have made trials with various anilins which were readily obtainable in the stores, but the result has been poor. We would suggest that you experiment with other aniline colors which are soluble in these liquids. You would best write to the dealers in colors stating very plainly that you want articles which are soluble in benzine or kerosene, and then a few practical trials will show you whether success may be attained. The solvent properties of these liquids have a certain definite range, which does not include substances soluble generally in aqueous liquors. We fear that on the whole you will not be successful in the matter.

6110. Varnish for Violins.

(M. McD.)—Dissolve over a moderate fire 120 parts of sandarac, 60 parts of shellac, a like quantity of mastic, and 20 parts of elemi in 1,500 parts of highly rectified spirit of wine, and after the solution has boiled up several times, add 60 parts of Venetian turpentine.

(2) Coarsely powder copal and glass, each 4 ounces; alcohol, 1 pint; camphor, ½ ounce; heat the mixture with frequent stirring in a water bath until solution is complete; when cold, decant the clear portion.

(3) Sandarac 1½ ounces.
Mastic, in tears 2 ounces.
Elemi ½ ounce.
Dragon's blood ¼ ounce.
Turpentine ½ ounce.
Castor oil ½ ounce.
Alcohol 10 ounces.

Put the turpentine and spirit in a wide-mouthed bottle, with a small quantity of powdered glass and the mastic. Stir frequently, and after 24 hours add the other resins. Allow the mixture to stand another 24 hours, and then add the oil under stirring. Let the mixture stand for two weeks in strong light, then filter through cotton.

6111. Neuralgia and Rheumatic Cure.

(J. U. B.)—The particular formula you desire is not available. Here are, however, some which may be of service to you:

(1) Ammonium bromide 1 dram.
Sodium salicylate 1 dram.
Tincture hyoseyamus 2 drams.
Water, enough to make... 4 ounces.
(2) Salol 128 grains.

Potassium iodide 256 grains.
Potassium bicarbonate. . . 128 grains.
Elixir adjuvans 1 pint.

(3) Neuralgia pills—
Iron phosphate 440 grains.
Tragacanth, powdered 120 grains.
Quinine sulphate 2½ ounces.
Extract henbane 2 ounces.
Extract aloes ½ ounce.
Acetic extract colchicum ½ ounce.
Camphor 160 grains.

Divide into 3½-grain pills. One to be taken every 3 hours until relief is obtained, then one twice a day for a few days.

See also Sept. 15, 1893, Era, page 252.

6112. Drops Versus Minims.

(Cardamom)—If a prescriber has seen fit to prescribe 20 drops of tincture of aconite, or creosote, that amount evidently should be dispensed. You would have no right to dispense 20 minims, as that quantity of either was not ordered. Upon the other hand, the exact quantity of a drop can only be approximated. The conditions which influence its size and weight are very variable, temperature being the greatest factor to change the volume, even from the same container. The laws of specific gravity and volume clearly demonstrate this fact, and the term, as a measure of quantity, should be discarded. In an article published in the May 1st, 1891, Era, page 268, there is a table showing the practical difference between the drops and minims of various fluids. In the instance of tincture of aconite, it is stated that 60 minims dropped from a common shop bottle equaled 120 drops. When dropped from the glass stopper of the same bottle, there were 102 drops, and when dropped from a minim measure the same quantity equaled 163 drops. Assuming the 20 drops of tincture of aconite to be measured by either of these standards, you can readily see the difference in quantity were 20 minims dispensed.

6113. Witch Hazel for the Hands.

(Subscriber).—Aromatic Witch Hazel Vinegar:

Extract cassia ½ ounce.
Extract violet ½ ounce.
Extract rose ½ ounce.
Tincture orris 4 ounces.
White wine vinegar 1 pint.
Distilled witch hazel,
enough to make 2 pints.
(2) Green soap 1 part.
Compound tincture benzoin 4 parts.
Glycerine 16 parts.
Distilled witch hazel 8 parts.
Rose water 8 parts.

(3) Glycerine 4 pounds.
Distilled witch hazel 1 quart.
Rose water 1 quart.

(4) The Era Formulary gives this for moisture of the hands:

Chromic acid 5 grains.
Distilled witch hazel ½ ounce.
Especially useful for moist, clammy hands. Should be applied with care.

6114. Haines' Golden Specific.

(M. T. A.)—The formula you quote, viz.: 16 parts bayberry root bark, 8 parts African ginger, and 12 parts capsicum, is that which has been several times stated to be the approximate composition of this proprietary article. You can judge yourself

whether in these substances there is any inherent virtue as regards the power to destry the appetite for liquor. We are frank to say that we are exceedingly skeptical. We have several times expressed our views with regard to liquor cures in general, and from examination of the formula above quoted we see no reason to subject them to alteration. The whole subject has been thoroughly considered in these pages, and you are referred to the Era for October 1, 1893, page 299; Nov. 15, 1893, page 450, and December 1, 1893, page 504. See also review of the book upon "Alcoholism and Its Treatment" in the April 1, 1893, issue, page 320.

6115. Who Was to Blame?

(A. R.) asks whether a druggist was right in dispensing the following prescription:

Aqueous extract aloes... 1 dram.
Codeine 5 grains.
Extract gentian, q. s.

Make into 6 pills. Take two pills a day. After taking the pills the patient experienced severe pain, and the prescriber said he wanted the prescription made into 60 pills instead of 6. In the first place, the physician made a mistake, as he says he wanted the mass divided into 60 pills instead of 6 as he had written. The druggist made another mistake in putting up the prescription, as he should have noticed the unusually large amount of extract of aloes contained in each dose. The maximum dose of extract of aloes is stated to be 10 grains. In this instance the patient, in taking two pills, received 20 grains of the extract, an unusual amount and one which should not be dispensed. The druggist erred in compounding the prescription, as did the physician who wrote it.

6116. Embalming Fluid.

(Subscriber.) Here are a number of formulas taken from the Era's files:

(1) Salicylic acid 4 drams.
Boric acid 5 drams.
Potassium carbonate 1 dram.
Dissolved in hot water 12½ ounces.
Glycerine 5 ounces.
Then add oil cinnamon, oil cloves, each 3 drams, dissolved in alcohol 12½ ounces.
(2) Arsenious acid 20 parts.
Bichloride mercury 30 parts.
Alcohol 200 parts.
Carbolic acid water (5 per cent) 3,250 parts.

The quantity required in the case of adults is 5 to 6 quarts.

(3) Thymol 15 grains.
Alcohol 3 fl. ounces.
Glycerine 10 fl. drams.
Water 5 fl. ounces.

Dissolve the thymol in the alcohol, add the glycerine and then the water. This has also been extensively used for preserving anatomical specimens.

(4) The circulatory system is cleansed by washing with cold water, until it issues quite clear from the body. This may occupy from two to five hours. Alcohol is then injected so as to extract as much water as possible. This requires about fifteen minutes. Ether is then injected to extract the fatty matters, this requiring from two to ten hours. A strong solution of tannin is then injected and allowed to be absorbed by the tissues, which should require from two to ten hours. The body

is then dried in a current of warm air which has been passed over calcium chloride. This may occupy from two to five hours, when the operation is complete.

6117. Preserving Eggs.

(Subscriber)—

Marsh dissolves in each gallon of water 12 ounces of quicklime, 6 ounces of common salt, 1 dram of soda, $\frac{1}{2}$ dram salt-peter, $\frac{1}{4}$ dram tartar and $1\frac{1}{2}$ drams of borax. The fluid is brought into a barrel and sufficient quicklime to cover the bottom is then poured in. Upon this is placed a layer of eggs, quicklime is again thrown in and so on until the barrel is filled, so that the liquor stands about 19 inches deep over the last layer of eggs. The barrel is then covered with a cloth, upon which is also scattered some lime.

(2)

A French authority gives the following: Melt 4 ounces clear beeswax in a porcelain dish over a gentle fire and stir in 8 ounces of olive oil. Let the solution of wax in oil cool somewhat, then dip the fresh eggs one by one into it so as to coat every part of the shell. A momentary dip is sufficient, all excess of the mixture being wiped off with a cotton cloth. The oil is absorbed in the shell, the wax hermetically closing all the pores. It is claimed that eggs thus treated and packed away in powdered charcoal in a cool place have been found after two years as fresh and palatable as when newly laid.

(3)

The Cyclopaedia of Receipts says that water glass or silicate of sodium has recently been used in Germany for rendering the shells of eggs non-porous. A small quantity of the clear syrupy solution is smeared over the entire surface of the shell. On drying, a thin, hard glassy film remains, which serves as an admirable protection and substitute for wax, oils, gums, etc.

(4)

Dip the eggs into a solution of two ounces gum arabic in a pint of cold water, let them dry and pack in powdered, well burned charcoal.

6118. Cheap Mucilage.

(J. K. M.) A cheap mucilage may be made

(1)

By dissolving clear glue in equal volumes of water and strong vinegar and adding one-fourth of an equal volume of alcohol, and a small quantity of solution of alum in water. The vinegar prevents the glue from gelatinizing by cooling, but the same result may be accomplished by adding a small quantity of nitric acid. Some of the preparations offered for sale are merely boiled starch or flour mixed with nitric acid to prevent the gelatinizing. A strong aqueous solution of dextrin makes a very adhesive and cheap mucilage.

(2)

Here is a formula which has been in service in our office work for some time with very satisfactory results. As given the formula makes a very thin, yet adhesive mucilage. If you desire a thicker mucilage add more dextrine:

Dextrine	2 ounces.
Powdered alum	1 dram.
White sugar	$\frac{1}{2}$ ounce.
Water	4 ounces.
Solution carbolic acid	2 drams.

Dissolve all the ingredients except the carbolic acid, in the water previously

raised to the boiling point. Continue the boiling until dissolved; when cold, add the carbolic acid.

(3)

Dextrine	3 ounces.
Acetic acid	1 ounce.
Methylated spirit	1 ounce.
Distilled water	5 ounces.

The dextrin is dissolved in the acid and water by the aid of heat, and the spirit added when cold.

6119. Book on the Commercial Side of the Drug Business.

(Cardamom.) We know of no work which will so thoroughly post a man, that after its perusal, he is competent to conduct a drug business or any other enterprise. Success depends upon the possession of certain principles and characteristics by the man himself. There is, of course, much to be learned from books upon business affairs, but, primarily, each must work out his own salvation. The best teachers that we know of are the current journals in various lines of trade, through diligent reading of which you may pick up a hint here, a hint there, that may be of much practical service in the conduct of your business. We call to mind a little book on "How to Keep a Store," which gives numerous hints and directions for fitting up a general store room and keeping its accounts and conducting its business. There have been published in the Era from time to time, particularly in recent issues, papers bearing upon this subject, and we shall have more in succeeding numbers. A knowledge of bookkeeping is essential in any business, and can only be learned by diligent application to books and thorough practical experience in business life. We shall shortly have a paper devoted to this particular subject.

The foregoing remarks apply as well to the matter of fitting up a store with fixtures, fountain, etc. Each must be his own judge in these particulars. The modern drug store requires showy fixtures, soda fountain and other articles which can be obtained from firms which make a specialty of these lines of wares, and from whom you may obtain much valuable assistance in the way of suggestion. The fixtures must not be too elaborate for the business you anticipate doing. We believe you will find some useful points in a paper presented on page 327 of our last issue, and in addition we refer you to the articles in the two numbers preceding under the same general head of drug store management. See also several articles on advertising by druggists.

6120. Gliding on China.

(W. J. L.) The gliding is done either by adhesive varnish or by heat. The varnish may be prepared by dissolving in hot boiled linseed oil an equal weight of either amber or copal. This is diluted with a proper quantity of oil of turpentine so as to be applied as thin as possible to the parts to be glided. Let stand, after varnishing, about twenty-four hours, then heat in an oven until so warm as to almost burn the fingers when handled. The heat softens the varnish, which is then ready to receive the gold leaf. It may be applied with a brush or plectrum of cotton, and the superfluous portion brushed off. Burnish when cold, interposing a piece of thin paper between the gold and burnisher. Where burning-in is practiced the gold reduced to powder is mixed with

powdered borax glass (anhydrous borax) moistened with a little gum water, and applied to the clean surface with a camel's hair pencil. When quite dry the article is put into a stove heated to about the temperature of an annealing oven. The gum burns off and the borax, by vitrifying, cements the gold with great firmness to the surface.

(2)

Gold Luster for China Painting.—Dissolve 1 dram gold in $\frac{3}{4}$ ounce of nitrohydrochloric acid, or simply dissolve this weight of chloride of gold in water. Add 6 grains of metallic tin, and enough nitrohydrochloric acid, if required, to dissolve it. Pour with constant stirring into a mixture of $\frac{1}{2}$ dram of balsam of sulphur and 20 grains oil of turpentine. As it stiffens add $\frac{1}{2}$ dram oil of turpentine and mix. More gold gives a brighter effect; tin inclines it to a violet tinge. Balsam of sulphur is made by boiling together in a covered vessel 1 part flowers of sulphur and 4 parts of linseed oil until the mass thickens.

(3)

To Dissolve Gold for Gliding Which Has to be Fired.—Triturate in a mortar some gold leaf and honey until reduced very fine. Then dissolve the honey with hot water and mix with a little gum water for use, or, dissolve gold in hot nitrohydrochloric acid, evaporate to dryness in a porcelain dish and dissolve in ether for use.

(4)

Gliding Compound for China.—The Techno Chemical Receipt Book gives this: Dissolve 1 ounce of gold in a mixture of 4½ ounces each of nitric and hydrochloric acids; then add 18½ grains each of tin and butter of antimony, and when the whole is dissolved dilute the fluid with 1 pint of water. The solution of gold is decomposed by a thick liquid prepared in the following manner: Dissolve at a moderate heat $\frac{1}{2}$ ounce each of sulphur and Venetian turpentine in 2½ fluid ounces of turpentine, until the solution has acquired a thick consistency and a dark brown color, and, when cold, add 1½ ounces of lavender. Pour the solution of gold upon this balsam, heat it moderately and stir. The solution of gold will be discolored, and the gold, entirely dissolved, passes into the oily fluid, which, when cold resembles rosin. The liquid standing over it, which contains the acid, is poured off, the oily fluid washed with warm water, and when the last traces of moisture have been removed, 2½ ounces of oil of lavender and 3½ ounces of oil of turpentine are added, and the mixture is heated until the whole is dissolved, when it is poured over 1¼ drams of sublimate of bismuth and allowed to settle. The clear portion is poured off and concentrated, an auriferous balsam consisting of a thick fluid with a light greenish luster is obtained in this manner. The Venetian turpentine is added as a drier. The auriferous resins remaining after the evaporation of the volatile oils become decomposed when exposed to heat, and, without melting, produce at a low temperature a residue of carbon and gold having the appearance of a very thin leaf.

6121. Black Ink.

(J. K. M.) Here are a number of formulas taken from the back files of the Era:

(1)

Logwood chips	1 pound.
---------------	----------

Boil in 1½ gallons of water until reduced to 2 quarts. Pour off and repeat as before. Mix, and add water to make 1 gallon in all. Then add bichromate of potash ½ ounce, Prussian blue ½ ounce, prussiate of potash ¼ ounce. Boil again 5 minutes, then strain and bottle.

(2) Boil repeatedly 160 parts of logwood with water. Pour the different decoctions together and reduce them by evaporation to 1,000 parts by weight. Dissolve in this liquid 1 part of neutral yellow chromate of potash, let it clear by standing, and draw the clear ink into bottles, which should be hermetically closed. This is a cheap and good ink, which flows freely from the pen, but spoils quickly if allowed to stand in open vessels.

(3) For an extemporaneous black ink:
Tannic acid..... 312 grains.
Powdered acacia..... 2½ drams.
Pyrogallic acid (Scher-
ing's) 16 grains.
White sugar..... 1 dram.
Sulphate of iron (best). 2½ drams.
Distilled water..... 1 pint.
Creosote 2 drops.

The quantity of acacia can be diminished if a freer flowing ink is desired.

(4)
Extract logwood..... 15 parts.
Carbonate of sodium,
crystallized 4 parts.
Neutral chromate po-
tassium 1 part.
Water 1,000 parts.

Dissolve the extract in 900 parts of the water, allow it to deposit, decant, heat to boiling, and add the carbonate of potassium; lastly, dissolve the chromate of potassium in the remainder of the water, and add to the logwood solution drop by drop with constant stirring.

(5)
Sulphate of Iron..... 1 ounce.
Logwood 1 ounce.
Gall-nuts 3½ ounces.
Gum arabic..... 1 ounce.
Pulverize each separately, mix, and add White wine, or acetic acid, 1 quart.

(6)
Nigrosine 160 grains.
Distilled water..... 16 ounces.

6122. Syrup Yerba Santa.

(B. S.) A very satisfactory formula may be found on page 127 of the National Formulary. Here are some others:

(1)
Fluid extract yerba santa 4 ounces.
Syrup, enough to make..... 32 ounces.
Heat the syrup to about 160° F., add the fluid extract and let the mixture stand in a covered vessel for two or three hours, occasionally stirring, a temperature of 140° F. being maintained. It may be necessary to supply the loss of water through evaporation by the addition of a little water. When perfectly cool the syrup is strained.

(2)
Fluid extract yerba santa 400 parts.
Stronger water ammonia. 4 parts.
Sugar 600 parts.
Water, enough to make..... 1,000 parts.
To 300 parts of water add the ammonia; to this add the fluid extract, stirring constantly, and allow to stand in an uncovered vessel until the ammoniacal odor disappears. Filter, add water to weigh 400 parts, and dissolve the sugar by agitation.

(3)
Fluid extract yerba santa 2 ounces.
Magnesium carbonate..... 1 ounce.
Sugar 10 ounces.
Water, enough to make..... 16 ounces.
Triturate the fluid extract with the carbonate of magnesium, and add about 7 fluid ounces of water, stirring well. Filter, adding enough water through the filter, to make the filter measure 9 fluid ounces. In this dissolve the sugar by agitation, without heat, and strain.

(4)
Yerba santa leaves..... 2 troy ounces.
Sugar 24 troy ounces.
Borax
Water, of each sufficient to make..... 2 pints.

Contuse the yerba santa so as to form a coarse powder, and mix it with 2 drams of borax. Mix borax and water in the proportion of 2 drams in the former and 1 pint of the latter. Moisten the yerba santa with 2 fluid ounces of this solution and pack it firmly into a cylindrical glass percolator; then pour on the menstruum until 1 pint of percolate has slowly passed. Should this contain a pronounced precipitate add borax at intervals in small amounts until all or nearly all of the sediment has dissolved. Filter the liquid and add the sugar to 14 fluid ounces of it. Stir the mixture until most of the sugar has dissolved, and decant the syrup. On the residue pour the remaining filtrate, apply heat, and after solution add this syrup to the previous lot and strain.

6123. Blood Albumen.

(J. J. McC.) Blood Albumen occurs in various forms. The lowest quality is packed in casks in the liquid state, and consists merely of blood which has been defibrinated by whipping. The purer forms of blood albumen are prepared from the blood of slaughtered animals, which, after coagulation, is filtered: 5 oxen, or 20 sheep, or 34 calves are said to yield the same quantity of dry albumen, viz., 2 pounds. In producing blood albumen for commerce, the objects borne in mind are the attainment of a substance whose solution is free from color, possesses perfect coagulation, and is cheap. The superior price of egg albumen has led to various attempts to produce blood albumen of a similar whiteness and quality. In these attempts animal charcoal, incipient coagulation, air rendered ozonic by means of electric induction, have severally been employed, but none have proved capable of producing an albumen at all comparable to egg albumen.

Campe recommends that the dishes and sieves for the separation of the serum should be in close proximity to the slaughter houses, since the retarding of the separation is almost sure to be followed by more or less coloration of the serum which, of course, leads to a dark-hued albumen. The blood clot is cut into small lumps, placed on the sieves, and left there from 40 to 48 hours. The first portions of the serum which pass through are always red, but after the lapse of about an hour, the percolating liquid shows a clear yellow color, the tinge varying, from deep gold to that of pale hock. After 48 hours the clear serum is drawn off, care having been taken that the lowest layer, containing the red blood corpuscles is kept back. About 25 to 30 per cent of serum is thus obtained from ox blood, and this raw

material can be manufactured into either the so-called "natural" albumen, without gloss, or the "patent" glossy albumen.

In making natural albumen ¼ pound of oil of turpentine is added to 100 pounds of serum and the whole is whipped for an hour with apparatus similar to the dasher of an old-fashioned churn. The turpentine, not only bleaches the serum and extracts the grease, but also helps to preserve it. It is allowed 24 to 36 hours to settle, when the clear serum is drawn off from the sediment. The drying is done in japanned iron dishes 1 foot long, 6 inches wide, and ¾ inch deep. The temperature is at first about 122° F., and is raised to nearly 135° F. (57° C) for 2 hours, after which it is allowed to fall to 118 or 120° F. (48 to 49° C). The drying occupies about 36 hours.

The manufacture of "patent" albumen differs from the above in the use of acids. To 100 pounds of serum are added 7 drams sulphuric acid, mixed with 6½ ounces concentrated acetic acid, and 6 pounds water; ¾ pound oil of turpentine is next mixed with it, and the compound is whipped for an hour. After settling for a day or more, the clear liquid is poured off, neutralized with ammonia, and dried as before. About 10 pounds of serum will yield 1 pound of dried blood albumen.

Both these preparations are called "primary" products, as distinguished from the "secondary" and "tertiary" products obtained from the residues left in the dishes after the drawing off of the pure serum and from the clot on the sieves. The albumen from the last named source is, of course, of very inferior quality, but is largely used in sugar refining.

6124. Silver Plating for Amateurs.

(H. D. A.) We have heard of instances where the amateur has been successful in a financial way in silver plating, and there are numerous firms which prepare full outfits for this sort of work. But as in all businesses, success comes only through perfect familiarity. There are many fakirs traveling through the country disposing of silver plating solutions which are frauds in every particular. The only satisfactory way is through the use of the electric current for the deposition of the silver upon the article to be plated. Such works as Napier's "Manual of Electro Metallurgy," Wahl's "Galvano Plastic Manipulations," etc., containing definite directions for plating in gold, silver and other metals, you will find of much service. You will also find desirable information in regard to the matter in various technical receipt books, and we republish below some formulas for producing the necessary solutions for use with the battery.

Silver Plating Solutions—For silver plating, the bath consists of potassium silver cyanide, prepared by precipitating solution of silver nitrate with potassium cyanide and dissolving the washed precipitate in excess of potassium cyanide solution.

(1)
Potassium cyanide..... 12 ounces.
Water 1 gallon.
Silver cyanide, about..... 1 tr. ounce.

Filter and use in a porcelain or glass vessel. For the whitening bath dissolve 1 lb. potassium cyanide in 1 gal. water, add ¼ oz. troy of silver cyanide and filter the solution. The baths are provided with silver feeding-plates for anodes proportionate in size to the surface of the work to be plated. These are connected with

the positive pole of the battery. The cleaned articles are connected by a copper wire with the zinc pole of the battery, dipped for a minute or two in the whitening bath, and when uniformly coated with a white film of silver, transferred to the plating bath under similar conditions. After the work is thoroughly cleaned and just before putting it into the bath, dip it momentarily in strong nitric acid or a mixture of equal parts nitric and sulphuric acids and rinse quickly. After this treatment it is sometimes dipped into dilute mercurous nitrate solution and rinsed again. This has the effect of coating the clean metal with a film of mercury, which secures a perfect adhesion of deposited silver.

Another formula sometimes used is:

Soft water.....	1 gal.
Cyanide of potassium.....	8 ozs.
Nitrate of silver.....	54 "

Dissolve the nitrate of silver in a sufficient quantity of pure water (soft) and add to it gradually, with constant stirring, hydrocyanic (prussic) acid until all the silver has been precipitated as cyanide, which may be known by the formation of no cloud in a portion of the clear liquid when a drop of the acid is added to it. Avoid adding an excess of the acid. Throw the precipitate upon a fine cotton cloth filter, and as the liquid runs through wash the precipitate on the cloth several times with pure water. Dissolve the cyanide of potassium in the water and stir in the cyanide of silver carefully removed from the cloth. If it does not dissolve in the liquid entirely, add more cyanide of potassium until it does, stirring continually. Let the impurities settle, and the bath is ready for use. Many electroplaters use a preliminary or silver "whitening" bath, which is the same composition, but contains less silver, more cyanide and is worked with somewhat stronger current. To make the work a financial success you will have to be sure of your own ability as a workman and then adopt ordinary business methods for drumming up trade. The subject is one which is a little outside the province of a pharmaceutical journal. You can get better aid from those skilled in the art.

PRESERVING EGGS—It is well known, says Food and Sanitation, that although any "kerosene" will preserve eggs for a certain length of time, the flavor penetrates and seriously affects their quality, as also does any varnish. The only absolutely certain and flavorless protection for eggs is petroleum jelly or vaseline, and this fact appears to be almost unknown. If eggs, within a day or two after being laid, are rubbed over thinly with a rag soaked in vaseline, they will keep, with all the flavor and curdiness of fresh-laid eggs, for at least six months without the slightest change, except that they slowly lose flavor and become rather tasteless, although this does not affect their quality in any way except for boiling. The packing material used must be perfectly free from taste or smell, as this would be absorbed by the vaseline and transferred to the contents of the shell, and for this reason we always use salt for packing, keeping the same salt and boxes from year to year. No doubt powdered chalk or cork dust would answer the same purpose, but as salt answers our purpose perfectly we have made no further experiments in this direction.

EXAMINATION QUESTIONS.

This Department is for the publication of questions and answers from our readers, the object being to place before them questions for self-examination and to indicate the directions in which study can be profitably carried on.

We select questions to which replies are desired, particularly questions suggested by personal experience and study.

Correct answers to the questions in each series will be published in a subsequent issue of the paper, as announced, together with the names of all persons sending us correct replies.

Write the number of the series at the top of your reply and write on one side of sheet only.

Address—EDITOR PHARMACEUTICAL ERA,
Box 583, Detroit, Mich.

SERIES NO. 3.

Replies should reach us not later than April 15th, 1894. Correct answers, together with the names of all persons answering correctly eight or more of the questions, will be published as soon thereafter as possible.

1. In what proportion must two quantities of powdered opium, containing 13.5 and 16 per cent of morphine respectively be mixed to produce 8 ounces of opium containing 14 per cent of morphine?

2. A quantity of official sulphuric acid weighs 15 grams. How many cubic centimeters does it measure? A quantity of official nitric acid measures 25 cubic centimeters. How much does it weigh in grams? In grains?

3. How would you distinguish between a root and an underground stem?

4. Which contains the larger percentage of alcohol: a solution made from equal parts by weight of alcohol and water, or one made from equal parts by measure of alcohol and water?

5. What is the percentage of bromine and how many grains of bromine are there in one ounce of potassium bromide?

6. What is an alum, chemically considered? Write the chemical symbols for two alums not containing aluminum. Name the pharmacopoeial and other varieties of alum.

7. Complete the following chemical equations:

8. What is meant by the following prefixes used in the nomenclature of salts: Mono, bi, bin, tri, quadri, di, bis, ter, tetra, super, hyper, per, sesqui, sub, hypo, proto, ortho, meta, pyro, para.

9. What are the chemical differences between red and yellow oxides of mercury? Give the chemical formula for each.

10. Which contains the more quinine (alkaloid), quinine bisulphate or quinine sulphate? Give the percentage of quinine in each salt and exhibit the figures used in your calculations.

SERIES NO. 4.

Replies should reach us not later than May 1st, 1894. Correct answers, together with the names of all persons answering correctly eight or more of the questions, will be published as soon thereafter as possible.

(1) How would you distinguish between carbonic acid and creosote?

(2) What is a symbol, also what does a chemical formula represent?

(3) How would you prove that the specific gravity of Iron is 7.50?

(4) Define stigma, and mention a drug which the pharmacopoeia directs shall consist wholly of stigmas?

(5) How would you distinguish between gallic and tannic acids?

(6) Name the best excipient for a pill mass with each of the following: An essential oil, potassium permanganate, balsam copaiba, silver nitrate, corrosive sublimate.

(7) How would you dispense the following prescription?

Ferrous sulphate..... 60 grains.

Potassium carbonate..... 36 grains.

Mix, and divide into 24 pills.

(8) How many one-eighth grain doses should there be in one-eighth ounce bottle morphine sulphate as found in the market?

(9) What is an alcohol chemically considered? Name those covered by your definition that are official in the United States Pharmacopoeia.

(10) How would you prove the air to be a mixture and not a chemical compound?

(11) What is the difference between benzoin and benzol?

CHLORINE FROM POTASSIUM CHLORATE AND MANGANESE DIOXIDE.

Prof. McLeod, at a recent meeting of the British Chemical Society, said that some years ago he showed that when a mixture of chlorate of potassium and manganese dioxide was heated, chlorine and oxygen were liberated according to the following equations:

The reactions taking place in almost imperceptible stages. Recently O. Brunck, in the *Berichte*, had stated that at a high temperature ozone and not chlorine was produced from the interaction of these two bodies. Prof. McLeod had therefore again examined the products and proceeded to demonstrate that his view was correct. A mixture of 3 grammes KClO_3 and 0.3 gramme MnO_2 was placed in a tube and connected with two U-shaped tubes, the first containing glass beads moistened with water and the second filled with a solution of nitrate of silver. When the mixture was heated the gas bubbled through the apparatus and quickly precipitated chloride of silver. The residue in the tube was also found to be faintly alkaline—a further piece of evidence in favor of the professor's view. The amount of chlorine evolved was estimated, and stated to be about 0.03. No evidence of ozone was obtained in any of the stages. (Br. and Col. Dr.)

The president remarked that this particular reaction was one of the earliest which a chemist learnt, and it was interesting to know that it was not absolutely settled even yet in spite of the usual text-book statements. Prof. Dunstan asked if it was not possible that an oxide of chloriae was produced, or that the residue contained alkaline peroxide, from which ozone might be obtained at a higher temperature than the boiling point of mercury.

Prof. McLeod replied that the temperature in the tube was considerably higher than the boiling point of mercury, and although he had not completed all his evidence in favor of the production of chlorine, he had come across no indications of ozone.

CAFFEINE CHLORAL.—A mixture of the two in molecular proportions. Administered hypodermically in doses of 0.2 to 0.4 gms. in relieving habitual constipation.

NEWS COMMENT.

E. E. Huyck has opened a drug store at Bay City, Mich.

Two clerks in a Toronto drug store fooling with a revolver; weapon exploded; one young man dead.

A plant for the manufacture of commercial chicory has been established at Chambers, Holt County, Neb.

Luke Hand, a Lake Geneva, Wis., resident, has shipped, so it is stated, ten gallons of skunk oil to the east, where it is sold for medical purposes.

A cylinder of compressed air exploded on the premises of Elmer & Amend, New York, April 3, causing very considerable wreckage of stock. No one hurt.

L. J. Kemp, a prominent citizen and druggist of Ada, O., died March 25. He was 46 years of age. His son-in-law, N. W. Tobias, assumes control of the store.

A man in a down-east drug store vainly consulted Webster's dictionary for an hour or more in search of the address of some person. Thought it was a directory.

It is reported that a number of druggists in Rochester, N. Y., are employing unregistered clerks, and the State Board of Pharmacy proposes to make it warm for them.

A New York newspaper sensationally depicts the sad case of a young man addicted to the "gentian habit," who daily swallows inordinate quantities of the tincture of gentian.

Bergen & Brynildsen have purchased the drug store of P. E. O'Connor, of Graceville, Minn. Mr. Brynildsen has been a silent partner in the business since its beginning in 1890.

Iowa pharmacists are congratulating themselves upon the fact that no legislation prejudicial to their interests is likely to be enacted in the present general assembly of the state.

Leo Joffe, the Bloomfield, N. J., druggist recently arrested on suspicion of setting fire to his store, has been exonerated by the grand jury and threatens to sue the town for \$50,000 damages.

Rochester, N. Y., druggists are cutting at a great rate. The Simon-pure cutter advertises goods at a certain price, the druggists go him one better. Both sides advertising largely dollar preparations at 55 cents.

P. A. Coughell, manager of the Market Pharmacy, Pullman, Ill., has resigned to accept a position with Stoll, Vannatta & Co., distillers, Lexington, Ky., as their representative among the drug trade of Chicago and vicinity.

Eastern capitalists have been in East St. Louis, Ill., looking over the different sites offered for manufacturing purposes. They propose to establish a wholesale druggist supply works on one of the many belt railways or switches.

First Druggist—"What do you think of the A. P. A.?"

Second ditto—"Don't believe in it at all."

First Druggist—"Don't believe in the American Pharmaceutical Association?"

Second Druggist—"What'll you have?"

—Ex.

P. Engeldinger, druggist, Hedrick, Ia., has a coin collection that is both rare and valuable. It consists of American and foreign coins, some of them being over 600 years old. He has eighty-three pieces at present and is constantly adding to it.

The body of Phillip Sommers, a St. Joseph, Mo., druggist, was recently found in an advanced stage of decomposition in one of the rooms of the Hess House, that city. Morphine poisoning is supposed to have caused his death, but whether accidental or otherwise is unknown.

Iowa papers say that Samuel W. Wilkinson, of Indianola, that state, is in Chicago performing wonderful feats as a mind reader. One of his feats was to go into a drug store and properly fill a very complicated prescription. He is not a pharmacist, had never been in that store before and was blindfolded.

The Virginia pharmacy law as amended requires physicians in business on their own account to register before July 1st, and allows practicing physicians living in towns of 1,500 or less, who are recognized by the State Medical Society and have had five years' practice, to register on paying the fee and renewing annually.

Mysterious mail robberies, detectives who cannot find the thieves and hundreds of angry correspondents whose money has gone astray have been making life miserable for certain venders of patent medicines and cosmetics at Southbend, Ind. More than \$10,000 is said to have disappeared from the mail addressed to them.

The Ohio Druggists' Mutual Fire Insurance Association, a Toledo concern, has recently been incorporated at Columbus. The incorporators are C. F. Johnson, F. T. Bower, H. F. Hastings, Fred K. Quine, T. B. Huston, A. Burger, John F. Lebold, M. C. Burlleigh, R. E. Hamlin and H. C. Kirchmaier. The general office will be in Toledo.

A terrific explosion wrecked the drug store of Alexander & Co., Canton, Miss., March 25th. A coal oil lamp fell to the floor and ignited two kegs of powder, which exploded and tore the building to atoms. Mr. Alexander, one of the proprietors, was fatally injured, and a man named Campbell received severe cuts from falling glass.

George A. Stearns caused considerable excitement among his brother druggists in Halifax, N. S., by addressing a letter to all the city doctors, asking their exclusive patronage on condition that he would sell no patent medicines. He gave as another reason that much "counter dispensing" was done in all the drug stores. A well-informed druggist says his scheme is impracticable.

Standish & Shearstone have opened a new drug and grocery store at Lockport, N. Y. Mr. Standish was for twenty-five years a member of the firm of Hartwell & Standish, now J. B. Hartwell & Son, while Mr. Shearstone was for seven years with W. J. Huntley as prescription clerk. John Phillips & Co., of Detroit, furnish the show cases and fixtures; Whittall, Tatam & Co., Philadelphia, the glass-

ware, show and shelf bottles, and the stock and sundries are furnished by New York parties.

William F. Pflueger, representative of Lord, Owen & Co., Chicago, recently took the prize as the most popular traveling man in Wisconsin. A year ago the Wisconsin Druggists' Exchange began giving short biographies of traveling men connected with the drug interests, who would send them their photographs. Each number of the Exchange has contained the picture and short sketch of the life of some of the "boys," and the publisher, Mr. Heimstreet, offered a prize of a gold medal to the one who should receive the largest number of votes, the ballots to be cast at the end of the year by the druggists in the state. Mr. Pflueger led by a large majority.

John J. Hall, of Woodstock, Ont., a druggist with an extended acquaintance among the fraternity in Canada, died after a very short illness, March 17. He was a man of great ability and having the courage of his convictions had, while yet on the threshold of life, earned a place in the hearts of his fellows of which any man might feel proud. He had occupied many positions of public trust, was president of the Ontario College of Pharmacy in 1892 and 1893, and was also a member of the Woodstock town council for a number of years. He was a Liberal in politics and a member of the Church of England. Deceased was 42 years old, and leaves behind a wife and two children.

A Buffalo druggist tells a newspaper scribe that the worst habit on earth is the patent medicine habit. He says: "Men have it a little oftener than women, and one rarely recovers from it, so far as my observation goes. Try one kind of patent medicine and that's all right. Try another kind and maybe that's all right. Try a third and you're a goner. In all my experience of many years I never knew of a person who had tried three different patent medicines, one right after the other, who had not by that time become a confirmed patent medicine fiend, given to reading newspaper advertisements in search of new remedies and of diseases to fit them. In time the habit wipes out its victim, same as morphine or drink would."

NEW HOME OF THE DETROIT FREE PRESS.

Many of our readers will be gratified to learn that increasing prosperity has compelled a change in the business affairs of that well-known journal, The Detroit Free Press. About May 10 the newspaper plant will be removed to the new purchase, the "Abstract building," on Lafayette avenue. Here, with larger quarters, new fittings, large web presses, new boilers and engines and better facilities all around the endeavor will be to still further improve the paper, which, ever since its establishment in 1831, has been a recognized leader in the field of journalism. The old building on Larned street west will hereafter be devoted entirely to the job work and show printing business of The Detroit Free Press Printing Co.

NEW YORK.

New York, April 7.—How many druggists who read of the suicide of Harry W. Hodson on April 3 remembered Harry Hodson who used to work at McKesson & Robbins' and was well known in this city and Brooklyn? They were one and the same. Hodson was a passenger on the Harlem railroad train which reaches White Plains about 1 o'clock in the morning. When the train had gone about a mile beyond Mt. Vernon the brakeman saw a man go out of the rear door of the last car and shortly afterward heard two shots. He looked out and saw the man was gone. The train was backed up and the body was found down an embankment. It was carried to White Plains and properly cared for. An inquiry came during the morning from Dr. Granger's sanitarium for weak-minded people at Brownsville about a nurse by the name of Hodson who was missing, and by this means as well as by papers in the suicide's pockets all the relatives of the deceased were apprised of his fate. "I knew Harry Hodson very well," said John Oehler, of McKesson & Robbins, "he worked for this firm at one time. About 1879 he was either head clerk or had full charge of Cyrus Pyle's drug store at the corner of Fulton and Pierpont streets, in Brooklyn. Several years later he became Brooklyn salesman for McKesson & Robbins. His work was very satisfactorily performed. We were much surprised one day when he told us he was going to leave this house. When asked for the reason Harry said that he had married a woman of some property who was, however, in poor health, and was compelled to go south. He had to go with her, of course. Since that time I have not heard much from him, but knew he was in charge of a drug store up in Oswego. When we knew him here he was a very agreeable gentleman." From other sources it is learned that the reason for the suicide was in all probability poor health. His wife had been dead some years, and after he had worked some years in Oswego he came here, finding employment as a nurse at the sanitarium.

The same good fellowship which has been shown since the first games in the tournament of the Wholesale Drug Trade-Bowling Association continues to be a marked feature of the agreeable Saturday afternoon gatherings of the teams and their friends. Now that the season is almost over, the interest in the battle for the prize has, of course, increased. Schemes for next year's tournament are many, which only go to show that everybody expects the boys will want to make it even more successful than the present series. There is a desire to secure better accommodations, and everybody admits that this is the first thing to be looked out for. The present alleys are not all they might be. The element of luck has entered very largely into the games, so that no bowling expert ought to judge by the scores in the games as to any particular man's ability. It is not stretching the truth to say that on better alleys the scores would have been 25 or 30 per cent better. Some members of the association thin, very favorably of the Germania alleys up near Houston street. The difference in time of getting to the Germania on account of the greater distance to be traveled would be more

than made up by the pleasure of bowling on alleys that are first-class. It is said that the Germania has the finest alleys in the city, so if the games are held there next year the scores ought to be a great deal better than those of this year's games. After this tournament is over, however, it will be time enough to think of what is going to be done months hence. These and other interesting matters will all come up for discussion and settlement when the association meets after the final game in the present series. The prizes will be awarded at the same time.

The game in Hohmann's alleys on Saturday, March 31, resulted in the first defeat of Whittall, Tatum & Co.'s team and two victories for the Dodge & Olcott five. The scores were as follows:

FIRST GAME.

WHITTALL, TATUM & CO.				
	S.	S.	H. Sc.	
Burgdorf	2	5	123
Lusk	0	8	106
Lester	2	3	142
Mannion	0	6	145
Tamlyn	2	3	142
Totals	7	16	671

DODGE & OLCOTT.

	S.	S.	H. Sc.	
Howe	1	5	154
Lusk	2	4	111
Euler	1	1	102
Martens	2	1	123
Ruddmann	3	6	124
Totals	9	17	725

SECOND GAME.

SEABURY & JOHNSON.				
	S.	S.	H. Sc.	
Benjamin	0	2	103
Dakin	3	3	141
Euler	3	1	92
De Zeller	3	1	62
Tremper	2	1	118
Totals	9	7	538

DODGE & OLCOTT.

	S.	S.	H. Sc.	
Howe	1	4	134
Lusk	0	3	113
Boze	2	5	157
Martens	2	5	134
Ruddman	2	5	151
Totals	5	19	689

The standing of the teams is as follows:

	W.	L.	H. S.	
Dodge & Olcott	4	1	725
Parke, Davis & Co.	4	1	751
Whittall, Tatum & Co.	3	2	671
McKesson & Robbins	2	2	822
Seabury & Johnson	1	3	641
C. G. Bacon & Co.	0	5	531

George J. Seabury has sent the following letter to Senator Voorhees in reply to the circulars sent out by the chairman of the Senate finance committee: "To the Hon. D. W. Voorhees, Chairman Finance Committee, United States Senate, Washington, D. C.: "My Dear Sir—No firm or corporation addressed by you will answer voluntarily many of the interrogatories you propounded in your circular. Even though you assume them that such was the procedure under the Walker and other tariff doctrinaires, they nevertheless will not expose their business any more than when you create an income tax and expect them to be truthful. Every importer knows full well that an inquisitorial committee will never receive facts. Ad valorem duties, pure and simple, have always brought to light under-valuations and disclosed dishonest practices. The honest importer has always been the victim, and so has been the government. "The true solution rests in specific duties. That policy gives at least a fair chance to importers and the government. Why should so much of our trade be laid on imported goods? Why not legislate for home industries and our home market and keep our profits circulated among the people instead of being hoarded by rubber baron manufacturers of Europe and their pauper labor? View the disaster that has already befallen our countrymen during the past six months under

the mere menace of the Wilson bill—not yet a law in this country, thank God! The Democratic party is always doing the wrong thing at the right time for its political opponents. Depend upon it, the more you combat the principles and policies that have always insured prosperity to the nation, the quicker the present administration will receive the censure of the people. Your legislation is neither practical nor patriotic. "We cannot expect much from politicians, college professors and theorists. Better leave your work to your successors, the Republican party. You Bourbons, Democrats never learn anything new nor forget anything old. The people will soon place the present administration where it belongs—to a dead past—and the sooner the so-called Democratic party is deposed the sooner the people will be restored to a healthy commercial and financial status. GEORGE J. SEABURY."

A. L. Cochran's store on Beaver street is open for business.

George A. Kelly, of Pittsburg, has been in the city this week.

Henry Asher has started a drug store on Broadway, Williamsburg.

S. Rosenstock has opened a drug store at the corner of Broome and Goerck streets.

Frederick B. Perry, the well known representative of Powers & Weightman, is in town.

Brent Good, of the Carter Medicine Co., has been in Montreal for a week visiting the company's factory.

Frederick Knauf has accepted a position with C. S. Erl, at Amsterdam avenue and Sixty-fifth street.

George W. Jarchow, class of '93, N. Y. C. P., has bought the store of Frank Gundlach, 538 Second avenue.

E. C. Ranney, of Delmar, N. J., is building a store on the beach, which he will occupy the coming season.

Martin J. Schmitt has bought the pharmacy of Curt W. Knappe at Carlstadt, N. J. Mr. Schmitt was one of the class of '91, N. Y. C. P.

Among other out-of-town drug trade men seen passing down Fulton street one day this week was James S. Robinson, of Memphis, Tenn.

Jeffrey L. Bauer, the far east agent of Whittall, Tatum & Co., has been in this city this week, but returns to New England in a few days.

Leo Morganstern, now located at the corner of Myrtle and Sumner avenues, Brooklyn, is going to try another corner of the same avenues.

William M. Davis, secretary of the Brooklyn Board of Pharmacy, has opened a drug store at the corner of Fulton street and Reade avenue, Brooklyn.

J. K. Brater is to open a store at the corner of Seventy-sixth street and Park avenue. He was formerly with Daggett & Ramsdell, on Fifth avenue.

Frank Gundlach has bought the drug store at the corner of Columbus avenue and 106th street. Mr. Gundlach was a member of the class of 1881, C. P. N. Y.

James E. Bartlett, of Detroit, has been in town for a few days. He is a cheerful, energetic young man, and his cheery manner makes him a welcome visitor everywhere.

Reports from the southern district of New Jersey show only one place, Atlantic City, where trade is booming at all. Complaining letters are coming in, from all the other towns.

A. M. Boney has rented the store at the corner of Thirty-eighth street and Broadway, under Abbey's Theater. He expects to open the store about May 7. His fountain is a Low Art Tile.

J. N. Hegeman & Co.'s store on Fifty-ninth street will be opened about the first of May.

Samuel Traugott has sold his store at 923 Third avenue to John Kremer and Herman Schmidt. The new firm will be known as Herman Schmidt & Co.

P. J. Noyes, manufacturing pharmacist of Lancaster, N. H., has been spending his vacation in this city seeing friends and picking up trade pointers.

Elijah Malloy, managing director of the Rosbach Mineral Water Co., Fifth avenue, sailed by the Lucania to-day for England, where he will consult with the British directors of the company.

Paul Monlun, manager of the New York office of Blanc & Cie, says the new perfume just put on the market by his house is the finest ever presented. It is called "Royal Violet" and is handsomely put up. Ill luck seems to follow T. E. Travers, of Fifty-fourth street and Second avenue. About three weeks ago he met with a painful accident in the drug house of Max Zeller, where he injured his kneecap by a fall. At last reports he was improving.

William H. Nichols, of the Nichols Chemical Company, of Brooklyn, has been elected first vice-president of the Manufacturers' Association of Kings and Queens Counties, notice of the formation of which was given in a recent issue of the Era.

Among the firms who have agreed to co-operate with the New York City branch of the Interstate Retail Druggists' League in securing signatures to the circular petition recently sent out are W. H. Schieffelin & Co., Lehn & Fink, and Tarrant & Co.

John W. Cox, of the Antikamnia Co., arrived in this city on Monday with his partner, Frank Ruf, they having had a first-class time on their three or four weeks' trip to Cuba. Mr. Ruf will spend a few days here visiting friends, and will then return to St. Louis.

William Wright, one of the most enterprising druggists of Atlantic City, has added many fine fixtures to his store, and has generally overhauled the shop, decorating liberally in white, purple and silver, and throwing out all his old cases. He has also put in a Low fountain.

Friends of H. Baskerville Mason, son of A. H. Mason, of Seabury & Johnson, will be glad to know that he is in splendid health and finds his position with Oppenheim, Sons & Co. as special representative very congenial. His home address is 14 Worship street, London, E. C.

The Fraser Tablet Triturate Manufacturing Company has a new issue of "Fraser's Notes" about ready to send out. The "Notes" have heretofore been sent out at irregular and infrequent intervals, but their favorable reception has led the firm to undertake their more frequent issue.

Friends of D. W. Wilson, of Chicago, who used to be in business here, will be pleased to hear that he is doing well out in that city. He was formerly with Gale & Blocki. Now he has opened a store in the Marshall Field building, where he will do a strictly prescription business in connection with the sale of physicians' supplies.

The uncertainty over the season's receipts of cod liver oil still continues. The fishing season generally ends at Easter, but it has been learned that the fish will go on up to the 1st of May. The

reason for this extension of a month is that the catch has been small and the livers are small, so that the crop is doubly reduced.

Frank H. Lalor, a druggist of Trenton, N. J., has been nominated for postmaster of Trenton, and will probably be confirmed. There has been quite a fight over that postmastership, and Mr. Lalor is the compromise candidate, the other aspirants having been sponsored by the New Jersey Senators. Mr. Lalor is a member of the New Jersey Pharmaceutical Association.

The Fulton Club, of 80 Fulton street, to which several gentlemen in the drug trade belong, has these new officers: President, George P. Benjamin; vice-president, Robert E. Bonner; secretary, Benjamin T. Fairchild; treasurer, Alexander Gilbert; directors, W. W. Farmer, John D. Fraser and Augustus M. Brush. The finances of the club are in good condition.

The Alden Pharmacy, at the corner of 123d street and Seventh avenue, does only a prescription business, and M. Sax, who is at the head of the concern, says that trade is very good, and that he believes that his way of conducting a drug store is the right one. Mr. Sax has had thirty-four years' experience in the business. He has a very handsome store, the premises having been completely refurbished since they were occupied by druggist Winter.

M. W. Millsbaugh has taken the position of traveling salesman for McKesson & Robbins, made vacant by the resignation of Nelson P. Snow. Mr. Millsbaugh was a member of the class of '89, College of Pharmacy of New York. Mr. Snow will try his fortune in the west. He was formerly connected with the Sagar Co. at Duluth, to whose employ he returns. He has a wide acquaintance, and as he is an energetic young man, he will undoubtedly do well in his new work.

The druggists who belong to Amalli Lodge, Knights of St. John and Malta, seem to be coming to the front in good style. T. B. Green, druggist at the corner of 15th street and Seventh avenue, has been elected eminent commander; Alonzo Dargan, city salesman for Tarrant & Co., lieutenant commander; Charles Bruhl, of Lehn & Fink, chancellor, and Warren A. Green, of Lehn & Fink, marshal. They, with the other officers, were installed on the evening of April 3.

Fassett & Messaros have bought out the drug store at the corner of 123d street and Lenox avenue, formerly known as the Lenox Pharmacy. William Wilts was the proprietor. The store is being completely refurbished both in stock and fixtures, and will be made a model uptown pharmacy. Mr. Fassett is well known in the drug trade, having formerly been with Caswell, Massey & Co. and with the Hegeman Co. He is going to make soda water one of the drawing cards of his new store, has secured a Low fountain.

R. W. Walker, New York agent for James W. Tufts, has furnished new fountains for C. F. Webster, Sixty-fourth street and Lexington avenue; G. M. Burr, Northport, L. I.; Paul Schissel, 1431 Broadway, Brooklyn, and R. G. Eccles, 111 Smith street, Brooklyn. The statement in these columns that fountains for A. G. Smith, Greenville, N. Y.; H. H. Howgate, Highland, N. Y.; C. R. Lush, Hempstead, N. Y., and C. C. Watkins, 235 Third avenue,

city, had been refitted was an error. The fountains were all new ones, placed in refitted stores.

Quite a jolly little dinner party was that given at the Arena on Thirty-first street on Friday evening last by John W. Cox. Among those present were Brent Good, of the Carter Medicine Co.; John M. Peters, of the Fraser Tablet-Triturate Co.; Joseph A. Toy, of the Carter Medicine Co.; Thomas P. Cook, of the New York Quinine & Chemical Works, and Frank Ruf. After the dinner the party adjourned to Palmer's Theater, made themselves comfortable in a box and saw John Drew's good acting in "The Butterflies."

The Pharmaceutical Graduates' Bowling Club, organized some ten years ago and to which most of the enterprising young men in the trade at that period belonged, was buried a few weeks ago. The cause of death was the fact that most of the members have either embarked on the sea of matrimony or in business for themselves, and consequently have little or no time to devote to the club. For the past five years this club was noted for its enjoyable annual ball, which was always a great success. At least 300 persons attended these functions and most of the men present were druggists. The death of so popular an organization is to be regretted.

Another restaurant besides the "Century," which seems to attract men in the drug trade, is that at the corner of Fulton and Dutch streets, very near the new home of the Era. It is a little place down in the basement, and has been well patronized for thirty years. At noon one can find there such men as Mr. Kolb, of Schering & Glatz; Mr. Phair, of R. M. Phair & Co.; Charles Weiss and William Timken, of McKesson & Robbins; M. J. Breitenbach, W. W. Dixon, of E. R. Squibb & Sons, and many others. There are generally a dozen or fifteen men in the trade gathered about a long table discussing lunch and "shop." The plans for forming the present highly successful bowling tournament were first talked of at this little restaurant.

Apocryph of the squib in these columns a few weeks ago about the great expense some druggists were going to in the matter of store fixtures, one druggist says: "Next to having a sub-station of the post-office in your store, the best drawing card is a bright, attractive shop. Of course I mean other things being equal. For instance, neither a sub-station, a nice store or anything else will make people trade at a shop whose prices are higher than at another one, two or three blocks away. Given two stores near together, same prices, same courtesy, same care in compounding, the best looking shop will get the bulk of the trade. Druggists don't spend money foolishly in fitting up their stores. They know that they have got to do it, especially if there is any competition."

Now that Lazell, Dalley & Co.'s exhibit of fine cut glass bottles is no more to be seen at Hegeman's store at Broadway and Thirtieth street, the occupants of the store have lost lots of fun. It used to be a very common thing for a crowd to stand outside the window during the evening looking at the exhibit. The young lady at the desk would turn the electric current off and on, but the spectators could not see how it

was done. After expressing their wonder they would try to find out where the light came from and would enter the store to ask questions about the matter. It was a very simple arrangement. Each of the dozen or so bottles rested over a hole in the counter, and below the holes were the electric lights. Turning on the current caused the light to shoot up into the bottles, making them shine and sparkle like thousands of gems. The mounting of the exhibit was in perfect harmony with the character of the articles, and even now passers turn and look at the window as if they expected to see the show.

NEW YORK COLLEGE OF PHARMACY.

The last drug exhibit of the senior class was given to-day.

Nux vomica and phosphorus are much in demand just at present. Ask any of the seniors if this isn't so.

A reunion dinner of the class of '93 will be held at Morelo's, Fifth avenue and Twenty-ninth street, on April 24.

H. W. Atwood is not yet able to get out of the house. He has had quite a siege of sickness, but everybody hopes to see him soon.

The seniors will have their class dinner on Monday, April 23, at Clarke's, on Twenty-third street. The professors will attend as guests of the class.

At a special meeting of the college held last Tuesday Dr. George G. Needham was chosen to take the place of the late Dr. Harrison on the Board of Pharmacy.

Pharmaceutical examinations (laboratory) for the senior class begin on Monday next, section 1 taking its turn on that day and section 2 on the following Wednesday.

The Alumni Association and the executive board will hold a meeting on Wednesday evening, April 11. Dr. James K. Crook will deliver a lecture on "First Aids to the Injured."

Oral examinations have been coming along one after the other since the last Monday in March. The questions were good, fair ones, but some of the boys had to wipe the perspiration off their foreheads before they got through.

Dr. Coblenz is a great favorite with the seniors. His last pharmacy lecture to them was given on Wednesday, and the young men showed by their applause what they think of this popular instructor.

In order to interest the students in the Alumni Journal the publishers of that excellent monthly have decided to reduce the annual subscription price for students only from \$1 to 50 cents. The Journal should not lack subscribers after that more than liberal offer.

The seniors did not succeed in having their class picture taken in front of the new building. That was, of course, a disappointment, but the class picture of 1894 has at least one value outside of its intrinsic worth. It is the last class picture taken in front of the old building, and as such will be treasured by the classes that are to come as well as the one that soon bids good-bye to the ancient structure. The picture of the present senior class was taken last Friday, and the proofs show that a first-class (in more than one sense) photograph was the result.

BOSTON.

Boston, April 9.—They are discussing at the State House the Norwegian system of selling liquor—a bill providing for the adoption of that system here being under consideration; and this has afforded the impregnable and always suspicious Henry H. Faxon, of Quincy, a chance to get in a bling at the druggists. Mr. Faxon said the other day: "The only virtue in the bill is the provision that retail druggists and apothecaries shall only sell liquor on presentation of a physicians' prescription. What good is that after all? You might as well try to regulate a whirlwind as an irresponsible, rascally druggist." Now, he probably fancies that such hollow talk is a sound argument. If the friends of the bill are depending upon such support as this for its passage, the measure will probably never become a law here.

Biddeford, Me., has had plenty of food for gossip of late, a suit for divorce having been begun by Dr. Henry Reny, proprietor of the Marble block drug store, who alleges that his wife has made a systematic attempt to end his life by administering poison in his food. Dr. Reny has been thrice married. His last marriage was to a Waterville young woman three years ago. By his first and second wives he had three children. Shortly after his last marriage he left his drug store in charge of a nephew, George G. Bellevue, and went to Somersworth, N. H., and began the practice of medicine. Last fall the nephew dying, Dr. Reny returned to Biddeford and resumed charge of the drug store. His friends there had received no intimation of any trouble between him and his young wife, but since the doctor has been living here it has been common report that discord reigned in his household. The wife was charged with being cruel to his children. Dr. Reny has frequently acknowledged to his intimate friends that he feared his wife. She became jealous of him, and frequently accused him of unfaithfulness. A short time ago Dr. Reny's health began to fail, his symptoms being those of arsenical poisoning. He had a short time before taken home six ounces of a solution containing a large percentage of arsenic. He had used less than half an ounce of it, but when he looked for the bottle he found it nearly empty. At the advice of his physicians he sent to Prof. Robinson, of Bowdoin College, a quantity of his secretions for analysis. The analysis showed distinct traces of arsenic. As soon as the chemist's report was received, Dr. Reny consulted counsel with a view to seeking a divorce, and made preparation for a hasty leave taking of his home. He took up a temporary abode at a friend's home, and sent two officers to his house to get his children. Mrs. Reny was not at home. Her adopted daughter let the officers in and they took the children in charge and carried them to a temporary place of abode. When the officer had an expressman went to the house to carry off the furniture. Mrs. Reny locked the doors and defied them to enter her home. City Marshal Harmon has threatened to arrest Mrs. Reny on a criminal charge, but the husband has pleaded with the marshal to defer his action. It is claimed that the children, especially the eldest, show signs of abuse. Dr. Reny's physical condition is said to be much worse than he realizes. It is the opinion of some that he can

never recover from the effects of the poison. Mrs. Reny denies that she ever administered poison to her husband. It is said that when the case comes to trial an attempt will be made to show that the traces of arsenic found by the chemist came from medicines administered by her husband himself or his attending physician, and that she knew nothing of the solution of arsenic in the house. Her counsel claims that the serious charge against her is but the outcome of a plot perpetrated by her husband and his relatives as a means of bridling about his separation from her.

A report comes from St. John, N. B., that Chesley, the druggist of Bostonville, Mass., who disappeared from that place with Mrs. Munz, the wife of the man with whom he boarded, has bobbed up in St. John. Now Chesley has announced himself as "Paul Ivereig," and the woman as his wife, and said that together they intend circling the globe, something after the "Paul Jones" fashion. The local papers boomed the pair for days, and one night there were several hundred people in a rink to see them start. Chesley delivered an address, in which he said: "Recently while sitting in a club room in New York discussing Paul Jones, some one wagged that I could not accomplish a feat like the one he had attempted. I accepted the wager, and agreed also, to have my wife accompany me. In one year from to-night we expect to be in this rink with \$5,000 in our pockets, plenty of clothes and unbounded fame. The pair then retired to a private room to disrobe. In a room adjoining 75 people were allowed to stand for 5 cents each. Autographs were disposed of at small sums each, and with the money collected, about \$10, Chesley purchased burlap, a needle and two pairs of women's cheap stockings. Clad in garments of burlap, which the woman sewed together with twine, the couple reappeared before the audience, and made more money by selling photographs and autographs. It is thought that the proposed tour is a bit of strategy to enable the runaways to get out of the country.

Among those who are making a vigorous remonstrance against the proposed subway in Boston are Smith, Benedict & Co., the wholesale druggists, who very pointedly say: "Our objections are as follows: First, we believe that its construction will cost millions in excess of the present estimate. Second, the street being opened from curb to curb, leaving no opportunity for teams to bring or carry freight, will cause all traffic on the street to be practically stopped, entailing upon all merchants on said street a loss which cannot be estimated, as it will, to all intent and purposes, suspend for the time any and all business. Third, the fact that all this expenditure of millions will not bring about what we are now seeking, viz., rapid transit, but on the contrary be a waste of the public funds, causing the taxpayers to seriously consider whether we are justified in committing our city to this costly scheme, which, provided it should be completed after years of delay and expense, would then be of little practical benefit to the public." Another drug house, that of Francis T. Church & Co., writes: "According to the admissions of the subway commission this Tremont street subway would be but a stepping stone to a system of tunnels which would honeycomb the found-

dations of our city, and we are fully convinced that many millions of dollars would be foolishly wasted, and that the traveling public who are now clamoring for rapid transit would find nothing but grievous disappointment and increased taxation." These expressions of opinion show that the Boston druggists are wide awake when great questions come up, and know how to state their views in a way that carries weight.

Experiments in tobacco growing in Massachusetts are now being made by experts, and upon the results of these experiments depend largely the future prosperity of this industry, so far as growing fine tobacco in New England is concerned. In the winter of '92 there was organized in Windsor the Connecticut Tobacco Experiment Company, for the purpose of carrying on the business of an experiment in the culture and care of tobacco, the same to be conducted and carried on in connection with and under the supervision of the Connecticut agricultural experiment station. The growers in Massachusetts believe that fine tobacco can be grown in this state, and await the results of the experts with much interest. Questions as to the effects of different fertilizers, climatic conditions and soil and their relations to each other are now receiving attention from the Massachusetts Tobacco Growers' Association. The preparing of the fertilizers is under the direction of Prof. Goessmann, of the experiment station, and the composition is unknown by the grower, or those who are to judge of the relative quality of the different plats. It is proposed to have three or more pieces in different towns, each piece to be divided in ten plats and each plat to be fertilized with a different formula. The area upon which good wrapper leaf such as the trade demands can be grown is limited, and is practically confined to the Connecticut and Housatonic valleys, and even within these limits the production has been far from uniform in color and quality, owing without doubt to the fact that in many instances a farmer has tried to grow tobacco because his neighbors did, not taking into consideration, perhaps, the fact that the soil upon his farm was very different from his neighbor's.

William J. Cutler died at his home, 388 Beacon street, on April 1. He was one of the oldest wholesale druggists in Boston, having been actively engaged in the business for sixty years up to the time of his retirement on account of declining health three years ago, at the age of 76. He came to Boston at the age of 12 years, founding in 1830 the wholesale drug house of Read & Cutler, which was afterwards changed to Cutler Bros. & Co., Mr. Cutler being the senior member of the firm. The house has long been one of the leading houses of its kind in Boston, and has headquarters on Broad street. Mr. Cutler was confided so closely to his main business that he found little time for other connections. He was one of the original directors of the First National Bank of Boston, and also one of the first members of the Boston Society of the New Jerusalem on Bowdoin street, taking always great satisfaction in the growth of the society. He had a wife and one son, Edward H. Cutler, of the firm of Noyes Bros. & Cutler, of St. Paul, the leading wholesale drug firm of the Northwest.

Weymouth druggists are to have no liquor licenses this year.

James W. Tufts has returned from Florida.

Bernard D. Sullivan, druggist, Dover, N. H., has failed.

Henry Stoll, formerly a Boston druggist, has lost his wife, who was an actress.

Clark Nutter's drug store at Somersworth, N. H., has been damaged slightly by fire.

Six druggists in New Britain, Conn., have been prosecuted for alleged violation of the liquor law.

Lombard & Boynton have bought out Pollard's drug store in Magoun square, North Somerville.

It is stated that the drug store of the late Dr. Barden, of South Boston, is to pass into new hands.

A new drug store has been opened in Lowell by M. L. Proulx. The Low Co. supplied the fountain.

A discharge from insolvency has been refused in the case of James A. R. Underwood, a Boston druggist.

Thomas D. Q. Perry, druggist, 625 Shawmut avenue, has failed. The liabilities amount to \$4,067, and the assets are slight.

W. E. Luscomb, of Salem, has closed one of his drug stores and consolidated two in his fine place in Town House square.

Edgar D. Chase, who, it is alleged, swindled H. C. Hall, a Waltham druggist, by means of forged checks, has been arrested.

Charles P. de Langille has bought Fuller's drug store on Market street, Lynn. In fitting it up he has put in a Tufts fountain.

C. A. Bass, who was in business in Cambridge for a long time, has bought the Oxnard pharmacy on Main street, Charlestown.

Dr. George Rice, a druggist, lost \$2,000 by a fire in Nohscott block, Framingham, on March 28. Fortunately he had his property insured.

F. M. Frost, who already had a drug store in Hyde Park, has opened another in Roslindale. Mr. Frost has put in a Low fountain.

William A. Blossom, who has just been elected ruler of the Elks of this city, was originally a drug clerk. At present he is a court constable.

A. Markwick, Jr., & Co., of Hartford, Conn., having sold out to the Park Drug Co., have bought the drug store of W. R. Chaffee in that city.

F. E. Gilbert has opened his third drug store in Providence. It is at the corner of Charles and Nichols streets, and contains a Low fountain.

Lothrop & Plnkham, of Dover, N. H., who have two drug stores there, are erecting a fine building, into which one of the stores will be moved.

On account of the widening of Harrison avenue, the drug store on the east side, at the corner of Beach street, will be demolished. It is a landmark.

There was a fire on the morning of April 3 in the house No. 5 Dover street, where Frank Smith, a druggist, had a room. Like other lodgers, Mr. Smith was a loser by the fire. One man in the building lost his life.

There has never been a drug store in Castine, Me., till now. W. A. Walker is the enterprising man who has established it, and he expects to do well in the summer, at least. His handsome fountain, from the Lows, will undoubtedly prove an attraction for vacation visitors.

There has been considerable complaint by several of the physicians in South Boston of the neglect of the apothecaries to respond to a ring of the night bell.

A discharge from insolvency has been granted Frank N. Littlefield (Willard Remedy Co.), 175 Tremont street. The case of Wm. R. Webster, the Roxbury druggist, comes up again in this court on April 27.

The members of the W. C. T. U. of Malden have voted to empower their committees representing the union to sign the petition of the Prohibition Club, praying that licenses be not granted to the druggists.

Herbert A. Greeley, proprietor of a drug store on Elm street, Somerville, was before the court recently, charged with keeping and exposing for sale intoxicating liquors. Being fined \$75, he appealed, and was held in the sum of \$100.

It is a fact of some interest that three of the chief officers of the Massachusetts Pharmaceutical Association—President J. Allen Rice, of Milford, Treasurer T. B. Nichols, of Salem, and Secretary M. L. H. Leavitt, of Boston—all use Low fountains.

Thieves entered the drug store of W. T. Brown on North Main street, Randolph, and carried away a quantity of cigars and tobacco, beside sundry other articles. The entrance was effected by breaking a square of glass in the front door.

The selectmen of Revere have voted not to grant any druggists' licenses this year, thus heading off any petitions. There are but three druggists in the town, and they had not petitioned for licenses when the board passed the vote shutting them off.

Here's a chance for some good druggist. Thomas H. Hall, hatter, 702 Main street, Worcester, has a good business block and desires to fit up the corner store for a druggist; "some one with a little cash and a lot of energy," he says. He is willing to give the man a start.

G. W. Cobb, of East Boston, one of the most active and progressive druggists here, has been canvassing Western Massachusetts in the interests of the retail trade. An association has just been organized in Hampden County, with L. R. Davis, of Northampton, as president.

Among the druggists who have recently bought apparatus from Tufts—some of it quite expensive—there are Dr. John McDonald, South Boston, G. C. Sweet & Co., Jamaica Plain, Samuel M. Moore, Danvers, J. P. Roller & Co., Salem, J. Fred Gilson and C. E. Walsh, Providence.

A new firm has been formed to look after the interests of J. W. Tufts in Chicago. It consists of Burton Adams, a brother of the late W. P. Adams, who long represented Mr. Tufts, and W. P. Niles, an ex-druggist from Belleville, Ont., who has been with Mr. Tufts for twenty years.

A tenant has been found for the drug store which was fitted up in handsome style in Rice's new block on Boylston street, near Massachusetts avenue, the proprietor of the store at the corner of Commonwealth and Massachusetts avenues having decided to move into the new quarters.

Some of the most "catchy" circulars seen in a long time are those prepared by Mr. John Macksey and issued by J. W. Tufts. All are carefully prepared and

some are handsomely illustrated. They are exactly what druggists want, for they contain much valuable information about soda fountains.

Walter A. Demeritt, druggist, No. 270 Columbus avenue, has purchased a new frame dwelling-house, numbered 68 Osborn road, Brookline, near Tubcock street, and will take up his residence there. The house is a twelve-room structure and is equipped with all modern improvements. The price is understood to have been about \$8,500.

The first meeting of the Cambridge and Somerville Druggists' Association since its organization was held on March 29, 11 Raymond hall, Cambridgeport, about 90 members being present. The principal business transacted was the beginning of arrangements for a new schedule of prices for patent medicines. Several articles were placed on the new list.

The Bracon police on March 21 made the biggest seizure of liquor ever known in that city. J. E. O'Connor's drug store and grocery at Centreville was raided and 200 barrels of cider, which was stored in the cellar, was seized. In the Police Court, just prior to the raid, O'Connor was sentenced to three months' imprisonment and to pay a fine of \$100. He appealed.

A lease for ten years has been executed by the Dolber-Goodyale Company, manufacturers of Mellin's Food, with the owners of the new six-story mercantile building, which has just been completed on the corner of Atlantic avenue and India street. The firm will take immediate possession. This building is so situated on the corner as to have light on three sides. It fronts 57 feet on the avenue, and 90 feet on India street, and is one of the best arranged buildings for business in that part of the city.

Following are the summaries of some of the corporation returns just filed at the State House: Angler Chemical Co., of Newton; assets, machinery \$300, cash and debts receivable \$18,467, manufactures and merchandise \$9,891; total, \$28,659; liabilities, capital stock \$10,000, debts \$18,213, profit and loss \$456; total \$28,669. Chemical Paper Co., of Holyoke; assets, buildings \$380,000, cash and debts receivable \$91,192, manufactures and merchandise \$116,064, trustee account \$90,390; total \$647,556; liabilities, capital stock \$250,000, debts \$287,872, profit and loss \$19,684, reserve for depreciation, \$90,000; total, \$647,556.

The Alumni Association of the Massachusetts College of Pharmacy gave a reception the other evening in the college building on St. Botolph street to the members of this year's graduating class. There was a large attendance of the members of the association and of the '94 men, and almost every gentleman was accompanied by a lady. The evening was passed in social conversation and in listening to a musical entertainment, which had been provided by the officers of the association. There was orchestral music under the direction of Mr. Bert Caswell, of Charlestown, and singing by Miss Alice Clark, of Wellesley, and Mrs. and Miss Denton. Among those present were Prof. Scoville, Mr. Jordan, of the milk inspection office, and his wife, and the president, Mr. J. Allen Talley, and wife, who have just returned to Boston from their wedding trip. A handsome clock was presented to Mr. and Mrs. Talley.

PHILADELPHIA.

Philadelphia, April 9. For a number of years William Wilson was employed by Smith, Kline & French Co., and until recently he was considered one of their trusted employes, and it was only by accident that his irregularities were discovered. A few nights ago Wilson came out of the store with a can which contained alcohol. He boarded one of the cars going up town, and it seemed that he recognized the detective, for he quickly jumped off the car, and showed what he could do in the way of sprinting.

The next morning he confessed to having robbed the firm and implicated David Bentley, who keeps the drug store at 829 Elm street, Camden. Bentley was immediately arrested on the charge of receiving stolen goods. He at first denied that the goods were in his place and when they were recovered on a search warrant he declared that he did not know that they had been stolen by Wilson. Both of the accused were held in \$1,000 bail. Mr. Kline said that the peculations had been going on for over two years. At one time both of the accused were employed in the same department.

An instance in which a doctor's directions about a prescription were disregarded, with fatal effect, is reported from Stratlington, Va. Robert C. Herman, of that town, became ill on April 4, and a four-ounce mixture containing strychnine and atropine salts was prepared for him with instructions to take a teaspoonful after each meal. Mr. Herman was impatient to get well and drank half of the contents of the bottle. Soon afterwards he became violently ill. The doctor was not told of his patient's rash action, and an injection of morphine and atropine was given. Then the man fell asleep; in the morning he was dead, and his wife awoke with a corpse at her side. The coroner's jury exonerated the doctor.

The election of Professor Henry G. Trimble to the editorship of the American Journal of Pharmacy is felt to be a guarantee for the future success and development of that publication. The Journal was first published in 1825, and until 1829, appeared but once a year, after which time it was a more frequent visitor in pharmaceutical circles. In 1835 a new series under its present title was commenced. Professor R. E. Griffith, who occupied the chair of materia medica, continuing as editor, in 1838 Professor Robert Bridges was editor, with Dr. Joseph Carson as his associate. Ten years later Professor Bridges withdrew and William Proctor, Jr., took his place. The late Professor John M. Maisch became editor in 1871 and held that position up to the time of his death last year. Not wishing to be too hasty in electing a successor for such an important trust, the college authorities waited several months before making a decision. Professor Trimble was not a candidate for the place, which involves much painstaking work, but his associates desiring to secure an editor whose reputation as a pharmacist and scientist would be of value to the Journal, he was finally induced to withdraw his objections.

R. Fideau, a representative of a large New York chemical house, has been in this city for over a week. His business has carried him to all parts of South America, to the West Indies and to Mexico. In speaking of the commercial inter-

ests he said: "Commercial interests in Brazil will be unsettled for a long time, and supply houses will not be in a hurry to solicit trade there, as no one knows to whom credit should be given. Most of the other South American countries are prospering. We still have to accept bills of exchange on London when dealing with the South American people. In Mexico they want to pay us in silver, but when we get a Mexican silver dollar across the line into the United States we find we can only get 65 cents for it, so we accept exchange on London. Business is improving in this country and I expect to see a boom in 1895. If the Wilson bill is passed the reciprocal treaties with some of the South American countries will not be abrogated. Those treaties have been of great advantage to the United States manufacturers. Before they were made we could not compete with French and English exporters, because we paid higher wages than Europeans, but when the duties on imports into the Latin countries were made less upon goods shipped from the United States than from Europe, our goods found a ready market. The treaties were made for a period of years, and I think they will stand until that period expires."

The Philadelphia College of Pharmacy has been the recipient of a splendid gift which will be of greatest interest to its students for generations to come. The famous herbarium collected and preserved by the late Isaac C. Martindale, one of this country's most eminent scientists, was presented to the institution on Friday, April 3, at a meeting of the board of trustees. It was purchased at a recent sale ordered by the executors of the Martindale estate by the Smith, Kline & French Co. and Mr. Howard B. French. This collection of plants and ferns was formally presented at the trustees' meeting, Mr. French making the donation speech. Chairman T. Morris Perot responded warmly in appreciation of the generosity of the donors, and he was followed in like vein by Mr. Charles Bullock, president of the college, and Mr. J. W. England and G. M. Beringer. A motion was adopted to the effect that three sets of engrossed resolutions be prepared, one for each of the donors and the third to be hung in the college library, thanking the gentlemen and setting forth the value of the gift. The collection will be kept apart from the herbarium already in possession of the college and will be known as the "Martindale Herbarium." It is the largest systematic herbarium in the United States, containing upward of 200,000 plants and ferns which have been secured from all parts of the globe. Expert botanists have classified and named the specimens. They have all been fastened on boards and enclosed in handsome walnut cases. The herbarium represents the life-work of Isaac C. Martindale. Years of untiring research and \$10,000 in money were expended to secure rare plants and complete the families of the vegetable kingdom. Many leading botanists and writers on scientific subjects considered it a high privilege to be allowed to obtain data from the Martindale herbarium. Professor Britton, of Columbia College, largely used it in compiling the flora of New Jersey in the Geological Survey. The herbarium is received at a very appropriate time—just when the facility is able to place it to such advantage in the newly furnished museum, that its

admirable features may be generally appreciated. All the students and friends of the college feel grateful towards the donors for their generosity and the practical shape it assumed.

The spring course in analytical chemistry under direction of Professor Trimble was formed on April 2 with an increased number of students, many of whom are pursuing advanced lines of research.

Haentzler's drug store at the corner of Third and Poplar streets has been sold to Harry Lee Barber.

Lehman R. Phillips has purchased the drug store of B. F. Creighton, at Third street and Washington avenue.

D. E. Branson, a representative for Johnson & Johnson, also for the Royal Malt Extract Company, is in this city.

J. H. Vogelbach has purchased the drug store formerly conducted by Dr. J. O. Everhard, Fifth and Cumberland streets.

While most of the drug houses and those connected with the drug trade report bad business, French, Cave & Co. continue to have plenty of orders, the business up to date showing an increase over the same period last year of 25 per cent.

George L. Geiger & Co. have bought out the store of C. Austin Mille, at Broad and Stevens streets, Camden, N. J. Mr. Geiger was formerly with Robert Shoemaker & Co., and was also interested in the drug store at Germantown avenue and Cambria street, trading under the name of Corley & Geiger.

Monroe P. Lind, of Schandeln & Lind, has been spending a week with Baltimore and Washington druggists. Notwithstanding the "calamity howlers" who abound in this city, and in whose opinion no prosperity can be expected during Democratic misrule, Mr. Lind succeeded in placing "Garwood's" new odors with nearly every firm he called upon.

On March 28 the body of a young man was found in a box car at Twelfth and Federal streets, Camden, and a few days later it was identified as Carl Weil, a drug clerk, 17 years old. He disappeared from his boarding house on March 25, and, it is thought, while temporarily insane, wandered to Camden, and lay down in the car, in which he froze to death. The body was taken to Baltimore for interment.

The famous "Midway Plaisance" of Bullock & Crenshaw, which has created considerable attention since its erection, has been dissected and its bones scattered to the four points of the store. The "Midway" was nothing more or less than a conglomeration of samples of sundries kept by the firm, and as they decided some time ago to go out of this kind of business they were selling such goods below the regular retail price.

Dr. Joseph H. Schenck has been recently afflicted with more than an ordinary share of trouble. On March 22 he received a telegram announcing that his son, Joseph H., Jr., was sick in Pittsburg, whither he immediately went and found his son dangerously sick in the hospital. He telegraphed for his wife to come on, which she did, and while they both were away their other son, Walter, was hurt by a heavy weight falling on him, and he was removed to the Pennsylvania Hospital. He was severely injured. Joseph, Jr., has a severe attack of typhoid fever.

CHICAGO.

Chicago, April 8.—Wacher & Dietz, Lake avenue and Cable Court, have dissolved partnership in their World's Fair store, by dividing their stock and selling their fixtures and lease to S. E. Hawley, the owner of the building. This was one of the most attractive stores during the fair and may soon be opened again under a new proprietor.

Silver Pharmacy Co., Chicago, Incorporated for \$8,000.

Charles H. Achelpohl, druggist, is succeeded by A. H. Hond.

C. J. Froning, druggist in Freeport, Ill., is reported to have sold out.

O. C. Kundson, of Yorkville, Ill., is succeeded by Kundson & Hallock.

John F. Carnegie has returned from his western trip, much improved in health.

Quincy, Ill. Sommer, Lynds & Co. now style themselves "Aldo Sommer Drug Co."

Thomas Burton, one of Morrison, Plummer & Co.'s representatives, is now here.

"Al." Hoffman, of Peter Van Schaack & Sons, reports trade in the country very good.

F. F. and James Wakefield have been closed on confessed judgments amounting to \$44.

Mr. Clark, of Clark & Barker, Rochelle, Illinois, has been in the city visiting friends.

Julius Mayr's pharmacy, 128 West Lake street, has been bought and is now occupied by Mr. Giddings.

Representative Ed. Hoff, of New York, w.... his glib tongue, reports immense sales in his special line.

L. Jungk, of Fifty-first and Halstead streets, is reported to have taken a Mr. Brill as partner in his business.

George Palm, city shipping clerk of Fuller & Fuller Co., was married on March 29 to Miss Josephine Rhoeber.

A. C. A. Foot, Fort Atkinson, Wisconsin, has been in the city visiting his many drug friends, and is looking remarkably well.

Ed. L. Scholtz, from Denver, has paid Morrison, Plummer & Co. a visit, and reports a steady and very firm business in Denver.

Franciscan Herb Medicine Co. has been licensed in this state and located in Chicago. Incorporated, capital stock of \$100,000.

Harry Graft has accepted a position with H. J. M. Schroeter, of 425 State street. Harry comes from the World's Fair district.

R. E. Rhode, of the North Side, is soliciting the drug trade for his specialties, offering elaborate show cards for inducements.

The Paris green combine announces the appearance of their schedule of prices for the coming season April 20th, for all standard brands.

George H. Owen, of the Unity Building, has sent out a circular offering to sell retail druggists postage stamps in \$50 lots at 2 per cent discount.

Mrs. A. E. Ebert is still in a helpless condition, it being necessary to administer ether each day for the dressing of her ulcers, now of long duration.

J. R. Shean, of the stock yards district, is now doing service in behalf of the school board. His brother is in charge of the store during Mr. S.'s absence.

Theo. C. Koessel is now in the employ of John Dietz, corner of State and Forty-fifth streets.

Mr. Gallbrith, of Robert Stevenson & Co., is now getting around an crutches at his home in Englewood.

Messrs. Well & Hall, of Elgin, Ill., have been represented in Chicago the last week by Mr. Hall—buying goods.

J. S. Link, of No. 649 West Twenty-first street, corner Paulina, is successor to Otto Coltzan, formerly Coltzan & Bat.

Professor Hugo W. C. Martin is still longing for a prominent corner down town store into which to move his drug stock.

Francis H. Tuthill, city bookkeeper for Morrison, Plummer & Co., is confined to his home at Austin, Ill., with inflammatory rheumatism.

Harry F. Krueger, Fifty-sixth and Jefferson avenue, is the new proprietor of the Jackson Park Pharmacy, formerly owned by Oscar F. Schmidt & Co.

A. J. Welsh's Morgan Park drug store was considerably damaged by fire and water March 22. It is not known yet whether Mr. Welsh will resume business.

Mr. German, of Lord, Owen & Company, seems very much enthused over the large increase in their cigar business, some of their brands having become quite popular.

Fred List, the druggist, supposed to have died from heart disease, was found by coroner's jury to have died from morphia. His store has already changed hands.

Otto Coltzan is now in his new store room opposite the old corner. With this move ends the Triangle Pharmacy, it having passed from a triangle to a square.

Francis H. Tuthill is again at his post of duty in Morrison, Plummer & Co.'s office, after his attack of inflammatory rheumatism, which has yet quite a hold on him.

Rausch Brothers, Cottage Grove avenue and Oakland boulevard, are having a Mosaic floor put in their store, also new paper and other fine improvements, with ceiling to match.

Dr. T. J. Baird, Wyoming, Iowa, is in the city replenishing his stock, which was partly destroyed by fire. Mr. Fitzgerald, of Morrison, Plummer & Co., has the doctor in charge.

L. D'Adouck Harris, the cut rate druggist at Grand Crossing, Ill., has been closed up by his creditors, and he has since left the city, his whereabouts being at present unknown.

W. W. Swearingen and wife have left the city for a visit to friends at Indianapolis and Terre Haute, Ind., and Decatur, Ill., expecting to be gone about ten days or a fortnight.

Charles L. Feldkamp, owner of two North Side drug stores, has failed, confessing judgments to the amount of \$5,226. This is a great surprise to some of his drug acquaintances.

The base ball team of Morrison, Plummer & Co. have a good deal of Anson's spring song "What I Will Do!" They promise to keep up with their past record and surpass it if possible.

C. W. Horton, night death watch of the county jail, an ex-druggist, formerly in the employ of T. N. Jamieson, was called upon to help execute the ex-druggist—Painter. He is now watching in the "wee hours" over "Assassin" Prendergast.

Allandra Pharmacy, conducted by A. G. Winkler, proprietor, has been making an elaborate display of the Crown Perfumery Company's extracts, soaps and other toilet articles.

Mr. Taft, city salesman of Sharp & Bohme, who is at present working for the interests of the firm among physicians of this city, is reported soon to go on the road. Mr. Powers is his successor in the city.

There is soon to be a grand ball at Brand's hall, under the auspices of the "buying boys" of the different wholesale drug houses of Chicago, and they have extended a cordial invitation to all drug friends.

G. H. Creik has purchased the store of George Umstead, corner Hoyne avenue and Harrison street. Mr. Creik was formerly manager of the Morgan Park store, and also at one time represented Sharp & Bohme.

Stone & Co., of Fifty-first and State streets, will remove to Twenty-sixth and Calumet avenue the 1st of May. Mr. Stone has done well at the old stand and hopes to do better in this nice residential neighborhood.

Charles H. Avery, druggist corner Fifty-fifth street and Monroe avenue, Hyde Park, will be very closely confined to business the next few weeks, as his prescription clerk was called home by the illness of his father.

Curtl & Co., Twenty-second street, opposite Dearborn street, will remove their stock and fixtures this month to the northeast corner Sixty-third street and Cottage Grove avenue, at the station of the South Side elevated railway, where they expect to do an increased amount of business.

John Masquett, formerly of Ashland avenue and Forty-seventh street, but later of the Western Glass Company, which has been destroyed by fire, is about to resume the retail drug business, and his ambition is to have a "South Side" drug store. Mr. Masquett is at present in Marlon, Ill., rebuilding the glass works, for which the town has offered to raise the funds.

A pathetic and touching incident occurred the other day in a southwest side drug store. A little while before, a man was seen gazing anxiously up and down, as though waiting for some one. He was apparently a laboring man. Some little after he entered the drug store and said: "You can telephone the doctor not to come now—the baby is dead." What a world of pathos and sorrow, expressed in those simple words, and how deep the hidden pain.

Last Friday the Retail Drug Association, of Chicago, called a meeting down town and spent an hour and a half in electing a president before taking up the regular routine of business. One of the members related an instance showing how careful the inspection of goods should be. He was called on to sell to one of his lady physicians some powdered ergot, and noticing the rather peculiar color of the powder, he took it to the inner room and after examining it, found the jar had been filled with "Maccaboy" snuff. It is hardly necessary to say that "Maccaboy" did not fill R. T. V. Wooten, West Madison street, was elected president, and a committee was appointed to investigate the "Hayes plan."

ST. LOUIS.

St. Louis, April 9.—The wholesale drug houses report a continued increase in the volume of business, both from the city and country trade. But while there is such a large volume of trade, there is a very unsatisfactory financial condition, so much so that wholesalers are not pressing sales, and in some instances they are declining to fill orders. A month ago the collections showed a promptness that led the wholesalers to believe that the period of stringency had passed, and that with the opening of spring there would be an abundance of money to meet all the requirements of the retailers. If this had been so, the season's trade would have been perfectly satisfactory. The Indian Territory offers St. Louis a very considerable trade, and while in volume it is as large as usual, the cash returns are so meagre just now that few sales are being made.

The St. Louis School of Pharmacy graduated about fifty pupils on April 9.

Mayor Cyrus P. Walbridge has returned from Hot Springs much benefited by his rest, and is again seen at his desk in the J. B. Merrill drug house.

Louis H. Behrens carried off the honorable mention in the graduating class of the Missouri Medical College. He has passed an examination for admission to the City Hospital.

The St. Louis wholesale drug houses continue to maintain the compact relative to prices and methods of delivering goods. Some of the retail druggists still object to the system, but the majority of them are accommodating themselves to the situation.

The Missouri State Board of Pharmacy met Tuesday at Kansas City and examined six applicants for registration as pharmacists. The examination was a written one, and also a practical one in the recognition of drugs, bottles and jars, which were in the examining chamber. The next sitting will be at Sedalia on the second Monday in July.

Joseph P. Tierney, the LaCade Hotel pharmacist, who went to his farm residence to recuperate his health, is being greatly benefited by the rural atmosphere. Mrs. M. M. Tierney, who succeeded him in the management of the store, has had extensive improvements made to the interior. The furnishings are all in white, and it is now one of the handsomest pharmacies in the West.

The effort to unite the Beaumont Medical College and the College of Physicians and Surgeons has come to naught. The object in uniting the two colleges was to strengthen the faculty and secure an endowed college. The trustees of the two colleges could not agree upon the proposition of the Beaumont board that all the members of the Beaumont should be taken into the faculty of the consolidated college. Another move may be made to effect a union.

Dr. John H. Jenks, professor of physiology and modern languages in Washington University, St. Louis, died Monday, April 9, of blood poisoning, the result of an accident which occurred a few days prior while dissecting a specimen before a class in physiology. He scratched his finger, but did not regard it as serious, but an itching sensation a day or two after alarmed him. Drs. H. H. Mudd and Harry Hodgson were summoned, but they discovered that his life could not be saved.

BUFFALO.

Buffalo, N. Y., April 9.—The drug trade is not satisfactory yet. Wholesalers say that the demand on them is not what it should be and retailers complain that a curious unsteadiness upsets all their calculations. If there is a good day once in awhile it is sure to be lost in a half-dozen very poor ones. Trade is not only slow, but movements of clerks and transfers of property have almost entirely dropped off. Every clerk is engaged in holding his place, for if he gives it up the chance is that the proprietor will conclude to get along without filling the position at present, and the result is that somebody is out. This being the time of year when there is a special call for cough medicines and the like, the failure to increase the slow sales of the winter is very disappointing. It's an ill wind that blows nobody good, though, and the mineral water people have found it out. The difficulty with the city water, which began about a month ago, at once increased the sales of all sorts of bottled water enormously. Even manufactured waters sold at such a rate that it was impossible to meet the demand. Bottles gave out and the wholesale druggists were beset for packages. The Lancaster glass works drove a rushing trade and are still doing so, for the confidence in the city water supply is not yet restored, though the danger is supposed to be practically confined to the mains, where the germs may propagate.

The typhoid fever epidemic, as it is called, involves two members of the faculty of the College of Pharmacy in a great amount of work. Dr. Wendt is health commissioner and Dr. Hill is city chemist. Both have worked very hard and given general satisfaction where fault-finding would naturally be great if any blundering or neglect could be discovered. Dr. Wendt detected the rapid increase of typhoid fever cases and at once ordered the use of boiled or filtered water only. The difficulty is supposed to have come from a single case of typhoid and was communicated to the water mains by the opening of a shore inlet to the pumping tunnel sometime in February, on account of the inlet in mid-Niagara being clogged by running ice. There were several hundred typhoid cases in all, 100 being reported in a single day, though some of them were old ones. As a rule the disease has been mild, though there have been a number of deaths. Hardly since the last cholera epidemic here in 1852 or thereabouts, has there been more of a stir. The medical fraternity soon divided on the question whether a filter would purify the water. The typhoid cases have dropped off, but the water will not be recommended till the big reservoir can be drawn off and the mains flushed. There was some doubt as to the method of attack. City Chemist Hill went to New York to look into the workings of the new electrozone and was satisfied that it is the coming disinfectant, but it involves the setting up of an expensive electrical plant that might not be needed afterwards, so the health commissioner has decided to use bromine. The plan is to draw off the reservoir and then use the dissolved bromine in spray form. As 60 pounds will be sufficient and the price by the single pound is only 80 cents, the cost will not be great. Dr. Vandenberg, the chemist, is not in the good graces of the

health commissioner and his suggestion that the big reservoir be drawn off was not at first received with favor, but was at length adopted. The trouble now is over the merits of liquid chlorine and bromine as disinfectants. Dr. Vandenberg asserts that it stands in proportion of 30 to chlorine and 35 to bromine. Moreover, chlorine can be had for 25 cents per pound. The health commissioner sneers at the wisdom of anyone who claims that a gas—not appearing to be acquainted with liquid chlorine—is worth anything in disinfecting a reservoir, and Dr. Vandenberg retorts in kind as to people who think chlorine is always a gas. He has procured an offer from a New York firm to sell liquid chlorine in quantity at the above price. Still the health department has ordered City Chemist Hill to go on with the bromine. The walls of the reservoir will be sprayed and scrubbed with brooms.

The Buffalo druggists have lately shown their strength in a determined descent upon three bills in the Legislature. They are called the liquor bill, the fluted bottle bill and the cocaine, chloral, etc., bill. The first provides for a druggist's license of \$50, by which the druggist may sell all sorts of liquors in less than 5-gallon quantities for certain named special purposes. The second bill concerns the trade in poisonous liquids by making it necessary to handle them only in certain labeled fluted bottles, and the third forbids the sale of preparations of opium, chloral or cocaine except on a physician's written prescription. (See editorial comment in this issue.—Ed.) The Erie County Pharmaceutical Association, which exists mainly for the purpose of dealing with emergencies, held two meetings late in March, the latter being on Saturday, March 24th, so that the local members of the Legislature could attend, as some of them did. The meeting was in charge of President A. C. Anthony, with Plin S. McArthur, secretary. A local paper sums up thus concisely the action taken:

"A lively discussion of the conditions of the bills ensued. It was declared that their passage would rob the druggists of the right to do a legitimate business. Erie County at the present time is not governed in the matter of restrictions of the sale of drugs as some of the other parts of the state, but a special law was enacted some time ago which is thought stricter upon this county than any other county in the state. The bill regulating the putting up of certain poisonous liquids in fluted bottles was the one which was most hotly received. It was impossible for the members to determine how it would work any benefit to the public if it should become a law. The distinction for the customer would be no different than at the present time. It is claimed if any of the bills become a law it will work a great injustice to the druggists, and in a large measure ruin their business. After the discussion had brought out all the objections to the bills it was resolved to repeat former action and to place the association upon record as opposing all of the bills, and also to request the Erie County members to do all in their power to defeat the proposed measures."

The meeting directed Secretary McArthur to send out circulars to every member of the association, calling attention to the bills and urging them to send individual letters to their representatives

at Albany, asking them to oppose the bills. The association has also asked for a hearing in the legislative committees, the bills having been introduced, some in one House and some in the other, and as soon as one is appointed another meeting will be held and a delegation made ready. So far no hearing has been announced and it is possible that none will be needed. It is reported that at least one bill is already dead in committee, and it is thought that the others will share its fate.

Charles A. Cooley, of Batavia, a graduate of the Buffalo College of Pharmacy, has bargained for a drug store in the neighboring village of Nunda.

William J. Pauling, clerk in Gregory's Genesee pharmacy, took the typhoid fever during the prevalence of it and went to the hospital. The attack was mild, however, and he is recovering.

F. L. Zimmerman, a Rochester pharmacist, has leased a store in the new business block at Central avenue and South Liberty street, Batavia, and will soon open a drug establishment there.

The Buffalo Ammonia Company has decided to enlarge its plant in order to about double its capacity. This company has recently acquired control of a similar works in Toronto and will also increase their capacity, as a part of the product turned out at the factory in Buffalo depends upon the capacity of that factory.

City druggists are wondering how far the price of cod liver oil will advance. They hear all about the small catch of cod to account for the smart rise in the price and wonder if that is all there is in it. The sharp fellow who is ready to corner any article that has suddenly become scarce may be about somewhere.

Judge White, of the Buffalo Superior Court, has issued an order authorizing Frederick Haller, as receiver of the Holland Medicine Company of this city, to sell all the outstanding book accounts and medical formulae for the medicines known as German Blood Food, Vitalka, and also a specific for catarrh. The accounts amount to about \$1,000.

Dr. Gregory lately visited the Illinois College of Pharmacy and the University of Chicago. He was greatly taken with the Kent laboratories of chemistry that have lately been established in the latter and calls them wonderful. He regrets that the Buffalo colleges were too far away from the World's Fair to profit, as Chicago colleges did, by the donations from exhibitors who didn't care to take their goods home again.

The College of Pharmacy is preparing for the annual examinations, which begin on April 16th. Some of the lecturers in the course concluded their work as early as April 1st, and the others hastened forward to get through. The class is a good one, but the course is severe and there is the usual amount of anxiety. Drs. Gregory and Gray are already engaged on the announcement for next year. The course is now so well defined, however, that few further changes are contemplated.

The students at the University of Buffalo have organized a collegiate V. M. C. A. John R. Mott, international secretary of this society, is here and has aroused much enthusiasm on the subject, especially in the matter of foreign missions, in which the organization is largely engaged. The four colleges of the university, medicine, pharmacy, dentistry and

law, muster about 450 students all together and a strong branch is assured. Mr. Bond, assistant manager of the American Radiator Works here, is to address the students on the subject also.

Charles Emmons, a druggist of Allegheny, near Olean, has been acting very queerly lately. He went into the house of Mrs. Flora Blessing, of Olean, a week or two ago and asked her to go on a trip with him. She refused and he drew a revolver and threatened to shoot her and her children. They ran out of the house and called a neighbor, who took the revolver away from Emmons. The latter then ran into the pantry and cut his throat with a butcher knife, though not inflicting a dangerous wound. Both he and Mrs. Blessing are married.

A city druggist says that the morphine habitues, as they are called, are destined to practically disappear with the present generation. There are no young people taking to the use of the drug. As a rule druggists dislike the trade and will be glad when it disappears. The regular customers now are mainly oldish women. The remark was occasioned by some reference to a customer, a woman, of course, who actually takes 25 grains at a dose and besides that fills up the chinks with brandy. She uses up all the money in that way that she can get and sets people to wondering what she would do if cash were unlimited.

The County Board of Pharmacy is having a quiet season at present in respect to violations of the law. There is so little change among the stores that the new druggist who imagines he can sell his goods without a licensed pharmacist is not at all numerous. The board has been very vigilant and gives no quarter. A story that there were groceries and other establishments on the east side selling poisons and the like is denied. There is a rumor that there is indication of an outbreak of price cutting, but druggists are reticent about it, saying that they hope to smother the thing quietly and save a resort to arms.

CLEVELAND.

The Ohio Druggists' Mutual Fire Association is a new Toledo corporation.

Will Flood, the popular Woodland avenue druggist, will organize a baseball nine.

Otto R. Goodyear, of 1396 Pearl street, contemplates opening a new store in the Lucas block, corner Walton avenue and Pearl street.

These hard times are leading to all sorts of makeshifts, a fact exemplified by the action of the city hospital authorities.

The officers of the Sandusky Druggists' Association for the ensuing year are Chas. A. Lehrer, president, and Adam Gerlach, secretary.

Novel and greatly improved changes are going on in the laboratory of Strong, Cobb & Co. When finished it will answer all modern requirements.

Wm. Bodenbender's well-known east end pharmacy is about to be sold. The name of the ingoing firm will be announced in the next issue.

S. M. Strong has been confined to his home for some time, but is now convalescing. While engaged in pruning trees, he lost his footing and injured his leg.

The Norton Chemical Co., of Chicago, and the Beemalt Co., of Boston, Mass.,

are holding a great advertising revival in this city.

The Kleant Manufacturing Co. is a new Akron corporation. It will manufacture cleaning compounds, etc.

A Coxy cigar is already on the market. What is the matter with a Coxy remedy? A commoneval cure with Coxy's trade mark is just the thing.

Henry W. Stecher is making preparations for the opening of the fly-paper season. His facilities will be equal to any enlightening spurt which may set in.

"Shall or can an allopath consult with a homeopath from a moral standpoint?" This is the question which perturbs the peace of the Cleveland Medical Society and threatens disruption.

Kinney, Levan & Co., the great Cleveland crockery house, are exploiting a patent jug especially destined for liquors or liquids in quantity. It is pronounced the most ingenious desideratum of the times.

Albert Schram, one of Arthur F. May's assistants, fell into the hands of a sharper recently, but did not care to avail himself of the inducements offered, notifying the police instead. It was the old bogus gold watch racket.

James and Charles Melville, the Sandusky druggists, were recently arrested for obstructing an officer of the law. The trouble seems to be the outgrowth of a political feud in connection with the possession of the county books by an examining committee.

The Diamond Rubber Co., of Akron, has been incorporated with a capital stock of \$50,000. The incorporators are Park B. Johnston, George Sherbundy, William Sherbundy, Frank O. Reinsnyder and Walter Sherbundy. The lines of manufacture will include druggists' specialties.

There are dangerous, rebellious law propositions now before the Ohio Legislature directly affecting the pharmaceutical profession. I say with Texas Siftings: Don't be a clam. If you have got to be anything of the kind, be a mud turtle. Then you may have some snap to you.

Novelties received by a local wholesale house in the sundry line are Havana cigars packed each in a hermetically closed glass tube, ten in a box. A liquor flask in true imitation of a cigar. The latter will no doubt become popular, owing to its practicability and cheapness. Hypocrites, both male and female, are happy.

The pure food exhibition which opened at the Cleveland Grays' armory April 2, has proved a success. It should be repeated periodically on a much larger scale to fitly illustrate the scope to which the pure food and drugs movement has attained. The exhibits will be shipped to Detroit, to reopen at the Auditorium for three weeks.

The Star Pharmacy, of imputed cut-rate-iniquity, was dislodged from its erstwhile location in the Case building, but hobbled up soon after at 55 Euclid avenue. The act of retaliation adopted by the C. P. A. will consequently remain in force indefinitely unless somebody decides that a move à la Da Gama were allowable under the circumstances.

Among the exhibits of the pure food fair are the Andrews Soap Co., Cincinnati; Plymouth Rock Gelatine Co., Cincinnati, Mass.; the Malted Milk Co., Racine, Wis.; C. B. Knox Gelatine Co., Johnston, N. Y.; the Welch Grape Juice Co., Vine-land, N. J.; E. S. Burnham Co., New

York; New York Condensed Milk Co., Swift & Co., Chicago, and the N. K. Fairbanks Co.

The city chemist has been put to work at compounding medicines and drugs in quantities, and he claims to have reached the following economical results: Tincture acetone, formerly \$5.35 per gallon, now \$2.65; tincture belladonna reduced from \$2.43 per gallon to \$1.43; tincture digitalis from \$2.38 to \$1.38 per gallon, tincture opium from \$5.50 to \$4 per gallon, other preparations have been produced at a similarly low cost.

There is more business done now on a cash basis than was ever known before the calamity period. Necessity and caution compelled a great many retailers to sell for cash only, a practice which, if continued, will have most salutary effects. J. F. Mund, the Broadway druggist, has always conducted a cash business, and practically demonstrates that it can be done without running the risk of diverting desirable patronage.

An old-time drug clerk of downtown nocturnal experience ought to be an infallible judge of mankind, but it seems as if C. M. Jordan, the night operative at the Euclid Avenue Pharmacy, were still uninitiated in the wiles of this world. About a fortnight since a stranger dropped in on him early in the morning requesting a loan on a \$250 diamond ring. C. M. was smitten with the hard-luck story of the caller and the morning star brilliancy of the ring with which he hoped to out-dazzle the most aggressive Easter avenue belle. But, oh, my! The police value the ring at about ten cents, and C. M.'s \$10.50, which he advanced on it, seems to be gone, gone forever.

April 1 was certainly a fool's day for Henry Johnson, alias Russel, and an unlucky one into the bargain, for that date marks the sudden termination of his bold career of crime. Johnson, who claims to be a chemist, and incidentally, the representative of a medical publishing house which accepts superannuated patent medicines in payment for advertisements, had been wanted by the police for some time for obtaining goods and money under false pretences and forgery, but deeming himself in danger had skipped for parts unknown. Emboldened, however, by the seeming lassitude of his Nemesis, he returned to Cleveland on April 1, coming from Detroit, where he has doubtless defrauded the drug trade also. No sooner did he land here than his canvass among the druggists was resumed; for he had obtained a new supply of drugs and medicines which he was anxious to turn into money. The detectives were not long in scenting their prey, and "chemist" Johnson was nabbed dead to rights. The specific charge against the swindler is forging Supt. Webber's name of the Huron Street Hospital to an order for medicines which Heller & Clouvy filled, as reported in the Era of March 15.

J. D. White, father of druggist W. L. White, Grand Rapids, Mich., committed suicide recently. It is thought domestic trouble induced despondency and led to the deed.

The death of Maj. Henri Le Carron, the British government spy, has been announced in London. He was at one time president of the Illinois Pharmaceutical Association and a retail druggist in Braidwood, Ill.

CINCINNATI.

Cincinnati, O., April 8. The suicide of druggist Charles Kampfmüller on March 27 last caused no end of talk, as the deceased was one of the best known pharmacists in southern Ohio. Shortly after 1 o'clock p. m., on the above date, a son of the deceased walked into the drug store, corner of Fairfax and Woodburn avenues, Walnut Hills, and found his father seated in a chair behind the prescription case, apparently deathly sick. The latter, with much anxiety, gasped "I have taken poison." A doctor was hastily summoned and then young Mr. Kampfmüller set to work to resuscitate his father, but his efforts were unavailing. In a short time life was extinct. The members of the Kampfmüller family are unable to assign any reason for the rash deed of the deceased save that he was an almost constant sufferer from muscular rheumatism. His pain was often so intense that he could no longer bear it, is the logical conclusion which many have formed as an excuse for his ending his earthly career.

Mr. Kampfmüller was born in Cassel, Germany, fifty-eight years ago, and came to this country when quite young. He conducted the drug store at Central avenue and Everett street for about twenty-five years. Ten years ago he opened the elegant pharmacy in Walnut Hills, and it is to-day doubtless one of the best-paying stores in the hill. The domestic relations of the deceased were always of the most pleasant nature, and he leaves a most interesting family. The funeral was one of the largest ever seen in Walnut Hills. The store at Fairfax and Woodburn avenues will in the future be conducted by the son of the deceased.

Louis W. Sauer, the central avenue druggist, came into possession of a novelty the other day that attracted widespread attention among the residents of Brighton and vicinity. It was nothing less than a pair of shoes that have been sent from one point to another on the lines of the United States Express Company, until now the tags attached to them can be counted by the hundreds. Mr. Sauer is an agent of the above company in the west end. The shoes are roughly constructed affairs, and from the inscription on the soles it is ascertained that they started on their travels from Norwich, Ct., February 27, 1894.

A well known travelling salesman caused no end of comment in drug circles here a few days ago by announcing that Eb. Cheney, the drug salesman who was supposed to have been drowned in the Ohio river, had been seen in New York and other eastern cities. Cheney traveled for C. P. Calvert & Co. for a number of years, and was supposed to have met a watery grave near Ripley, O. It was thought at the time his body was found that the identification was complete, but Mrs. Cheney recently stated that she never saw his remains. The matter is being investigated by Mr. Cheney's relatives, and developments are anxiously awaited.

(In this connection the following letter is pertinent.—Ed.)

To the Editor:

Your correspondent from this city says the accounts of W. C. Arons, the book-keeper who suicided, were all straight. We wish to make no reflections on the deceased, but have never said this to anybody. The accounts are being exam-

ined, and it is not known what, if any, shortage there is. Eb Cheney, who traveled for the writer, was mentioned in a way to at least justify the conclusion that his was a case of suicide. Mr. Cheney was not in the employ of C. P. Calvert & Co. at the time of his death, but was with a jobbing house of Columbus, O. But I wish to state my belief that Eb. Cheney NEVER SUICIDED. The writer investigated the matter carefully, and to his mind Mr. Cheney was accidentally drowned. His was a noble character. There was no shadow of a suspicion on anything he did. He was a good business man, truthful, earnest and conscientious in his work, and had the most delightful family relations. Nothing previous to nor since his death has ever shown there was the slightest cause for a desire to die. He was, in the mind of the writer, one of God's noblemen, and it is a pleasure to speak with such knowledge of a man known to the writer from the beginning of his business career.

Very truly,

C. P. CALVERT,
President of the Standard Drug Co.

Druggist Ed Gray is out again.

Dr. Leroy Bramble, the physician-druggist, is on the convalescent list.

John F. Haynes, who is representing Lehn & Fink, of New York, on the road, will soon be with us again.

Adolph G. Falk has opened an elegant drug store at Delhi. The place is a beauty and is strictly up to date.

Frank B. Hight, the clever representative of the Butler Hard Rubber Company, is here circulating among his host of friends.

Herman E. Iglar, the well known pharmacist, has just opened an elegant pharmacy in the beautiful suburban village of Glendale. The appointments of the store are excellent.

John B. Rascher, the veteran pharmacist who was formerly with H. H. Kooken, is now the manager of the Darragh Pharmacy, corner Richmond street and Central avenue.

Dr. John Keeshan, the veteran druggist, has been suffering from the peculations of one of his employes. The fellow was caught "dead to rights" a few days ago and peremptorily discharged.

The commencement exercises and annual examination at the Cincinnati College of Pharmacy will be held next week. The boys are putting in their best licks now preparing for the examination.

Dr. John C. Otis is still making extensive alterations in his pretty store corner of Sixth and Vine streets. When the doctor gets through with his remodeling his place will be entirely metamorphosed.

A fine oil painting of Sandow, the strong man, is on exhibition in one of the large show-windows at Weatherhead's drug store, corner Sixth and Vine streets. The picture is the property of the Bovox Essence of Beef Company, of Boston.

Dr. R. H. Weatherhead is making some necessary changes in his store at Sixth and Vine streets. The cigar department has been rearranged and the soda fountain is adorned with potted plants in honor of the arrival of gentle spring.

Druggist Emil Heun has been re-elected treasurer of Elmwood Place. His term of office began last Tuesday, and was for the next two years. The election of Mr. Heun was against the wishes of the coun-

cilmen, who at once increased the treasurer's bond from \$5,000 to \$25,000. Mr. Heun gave the increased bond.

The Stillwell bill, which is now pending in the Legislature at Columbus, is being bitterly fought by the druggists of the city, and, in fact, all over the state. The bill makes it mandatory that all pharmacists in Ohio shall pay \$250 a year for retailing liquors.

At the commencement exercises of the Ohio Medical College last night a number of local young pharmacists were noticed. The drug business must certainly be a healthful occupation, for a large number of druggists were also prominent at the banquet table.

Frank G. Grote, well known wholesale druggist, was throwing bouquets at himself yesterday, and every one of his many employes received a nice present. The cause of Mr. Grote's bilious mood was the arrival of a beautiful girl-baby at his home in Walnut Hills.

Gov. McKinley has appointed the three new police commissioners, and there was not a druggist in the trio. Ed Detner, John Bauer and other pharmacists who had aspirations in this direction must now be contented to take a back seat and wait until some member's term expires.

Julius Greyer, the clever pharmacist, is now said to be the champion bowler at Music Verein. Julius is also "some pumpkins" at dancing, and his society is much sought by the charming members of the gentler sex. Herr Greyer's friends regard him as the Beau Brummel of the profession.

The show-window at Ed Voss's drug store, corner Twelfth and Vine streets, contained an automatic hen last week which laid wooden eggs at certain intervals. The device was used as an advertising medium for an Easter theatrical attraction, and it also did some good for Bro. Voss and his pharmacy.

George W. Kyllius, the druggist at Liberty and Denman streets, has gained some distinction by being the first member of his craft to purchase a season ticket at the ball park. George is a dyed-in-the-wool crank, and between his library and horse and buggy he will now have very little time for "frivolous" pleasure.

Louis Rapp, a popular young "peste jammer," is now in charge of Groenland's pharmacy at Fifth and Smith streets. Lou is well known among the druggists and was for several years the senior clerk at Friemalt's Pharmacy, corner of Eighth and Main streets. It is hinted that he is soon to lead a charming society belle to the altar.

A petition was circulated among the wholesale druggists one day last week to see how they felt about closing their stores at 12 o'clock noon on Saturdays during the heated term. Every man signed the petition, and the boys can now rest assured that they can see all the ball games on the last day of the week during July and August.

The Board of Hospital Trustees met yesterday, but no decision was arrived at as to whether the homeopathic and eclectic physicians should be accorded the same privileges as their allopathic brethren. The board of trustees, as a committee of the whole, will soon visit the Cook County Hospital to see how that institution thrives under the management of a "mixed" staff.

A novelty has been introduced among local druggists which seems to be in popular favor. It is a small celluloid dial with two hands. It can be fastened upon a bottle and the hands so arranged that an absent-minded patient cannot forget when to take his medicine. Several of the downtown pharmacists have laid in large stocks of the simple little device.

There is a scheme on foot among local physicians and pharmacists looking to the erection of a mammoth building for the use of the leading disciples of Esculapius. The contemplated structure is to be patterned after a similar building which is soon to be erected in New York. The first floor is to be occupied by druggists and dealers in medical supplies, and the offices are to be rented to doctors. The building will be nicely arranged for the convenience of the sick.

The employes of the various wholesale drug houses have taken the preliminary steps toward organizing a social club, to be known as the "Pill Rollers." It is expected that the organization will include fifty of the best known young men employed in this city, and a club house is to be secured in the west end. The proprietors of the different drug houses are encouraging the scheme, as they think social intercourse among the men will be productive of much good.

FROM THE SOUTH.

Ed Delouest, Ocala, Fla., has sold out. D. D. Smith has opened a new store at Waterboro, S. C.

E. S. Lyndon, La Grange, Ga., is succeeded by P. R. Holt.

Dr. P. Burgos, of Key West, Fla., has removed his business to Tampa.

J. T. Ames has purchased the pharmacy of J. A. Woodcock, Asheville, N. C.

P. F. Fleischmidt has accepted a position with G. F. Hedrich, Charleston, S. C.

E. A. Phillips has removed his business from Clear Water Harbor, Fla., to Tampa.

H. E. Walsh, representing the Pictorial Printing Co., of Chicago, has been in Atlanta.

Richard Nevette & Co., Richmond, Va., have dissolved, and are succeeded by D. A. Kuyk.

George Hughes, a prominent druggist of Jacksonville, Fla., has made an assignment.

Dr. J. A. Paciti, Jacksonville, Fla., died several days ago. His business is being wound up by his widow.

Messrs. Lewis, Bailey & Co., Shreveport, La., who were burned out a few weeks ago, will at once rebuild.

T. L. Massenber, of Macon, Ga., was made permanent receiver for the Brady Crotine Co., of the same town.

Max. Bloomstein, Nashville, Tenn., has removed into his new store, which he recently fitted up in elaborate style.

Dr. Bailey, of Beaufort, S. C., has bought the business of N. J. Hathorn, deceased, 117 West Mitchell street, Atlanta, Ga.

J. A. Conover, late manager for Dr. J. C. L'Engle, Jacksonville, Fla., has bought out Mr. N. Woodridge, of the Everett Pharmacy.

M. E. Lee, H. M. Lee and J. H. Collins have applied for a charter for the "Lee's Pharmacy Co.," Atlanta, the capital stock to be \$3,000.

G. H. Thompson, for some time with C. F. Swettman & Son, is now with H. Plenge, both of Charleston, S. C.

The Clara Pharmacy, Atlanta, Ga., has removed from corner Clara and Marietta streets to corner Moore and Decatur streets.

Mr. Phillips, formerly with Bowle & Moles, of Charleston, S. C., has gone into the wholesale drug business in Jacksonville, Fla.

Frank Smith has purchased the West End Drug Store, 138 Wentworth street, Charleston, S. C., formerly owned by C. G. Elekman, deceased.

Mr. Hayden, of Hayden & Kirke, Jacksonville, Fla., is dead. Mr. Kirke has bought his late partner's interest, and the firm is changed to J. E. Kirke & Co.

Charles E. Scharloek has purchased the branch store of Dr. H. Baer, corner Middle and Calhoun streets, Charleston, S. C., of which he has been manager for many years.

Several of the druggists of Atlanta have been fined in the city court for running nickel-in-the-slot machines at their cigar stands, they being called lotteries on a small scale.

Trevitt & Johnson, Rome, Ga., have bought out Hammock, Lucas & Co., and will run this store, together with Crouch & Watson's old store, 206 Broadway street, same town.

W. H. Lightstone, of the Palmetto Pharmacy, Jacksonville, Fla., has sold out his business and removed to Charleston, S. C., and is now clerking for the Palmetto Pharmacy, of the latter city.

Jacob's Pharmacy Co., Atlanta, have leased nearly the whole ground floor of the Old Capitol building, corner Marietta and Forsyth streets, and will remodel it, making it the largest drug house in the south.

There is great excitement in South Carolina over the dispensary law, allowing apothecaries to search private residences. Riots have occurred in several towns, and a few of the dispensaries sacked and burned.

PACIFIC COAST.

Mr. Richardson and family, of Merced, have arrived in Modesto, where Mr. Richardson is engaged as druggist.

D. J. Hill, a popular druggist of Castle Rock, Wash., was recently united in marriage to Hattie Clark, one of Cowitt's successful school teachers.

The new drug store at Moreno, Cal., is being rapidly put in shape, and will be in running order next week. Ward McKim has assumed charge of the store.

The Board of Health of Sacramento, Cal., held a short meeting March 22 and elected Dr. Fowler city physician. He will act as Health Officer and secretary of the board.

Wm. Hunter, formerly in a drug store at Walla Walla, Wash., has been arrested on a warrant sworn out by a livery firm of Spokane, charging him with the larceny of a team.

Otto G. Trautz, who has had charge of the prescription department of Parker & Chatfield's drug business, Biggs, Cal., has accepted a position with a firm in San Francisco, where he will go after the 1st of April.

The manufacture and sale of drugs is the object of the Dr. C. E. Teel Co., which has filed articles of Incorporation. The place of business is to be at Taco-

mn, Wash., and the capital stock is \$100,000.

After April 1 the store now occupied by the City drug store in the International Hotel block, Helena, Mont., will be for rent. Marcus Lissner, the owner of the store, will make it an object to any one who may desire to rent the premises for the drug business.

Wm. Stewart, the druggist at Napa, Cal., files his petition to be declared insolvent. His liabilities are \$4,482.25, divided about equally between Napa parties and San Francisco and eastern firms. His assets, consisting of stock and fixtures, amount to \$1,100.

The congress of physicians is to convene in San Francisco June 5. Among the prominent men who will attend is N. S. Davis, of Chicago, the father of the association. Excursions will be arranged for the visitors in all directions. Special rates have been offered by steamship companies and by some of the railroads, as well as by the hotel people.

The business failure of C. B. Elbe, proprietor of the pharmacy at the corner of Park street and Santa Clara avenue, Alameda, was a decided surprise to his neighbors. The failure is attributed by Mr. Elbe to his inability to collect outstanding bills. He made an assignment to Redington & Co., wholesale druggists of San Francisco, to whom he is said to be indebted in the sum of \$2,000. Max Glas, who has been in Mr. Elbe's employ for some time, was installed as manager by Redington & Co.

THE INTERSTATE LEAGUE AND JOHN D. PARK & SONS CO.

The enemy of the retail drug trade is beginning to realize the power of united action instituted by the Interstate Retail Druggists' League. This is so clearly demonstrated by the issue of a circular letter by Messrs. John D. Park & Sons Co., of Cincinnati, that comment upon this fact is wasted. The circular plainly indicates that the wholesale drug trade of the United States has commenced to retaliate for Park's many aggressions by refusing to distribute their special goods and patents of their own manufacture. This firm is likewise convinced that there will be no break in the ranks of the wholesaler and that they need not look for aid in that direction. The circular letter calls upon the retail drug trade, under the guise of friendship, for assistance to defeat the legitimate wholesale druggist in his efforts, as the true friend of the retailer, for the re-establishment of legitimate profits. According to this carefully worded circular, the retail druggist is requested to order direct Park's special goods and all other wares; in consideration of Park's generous offer of the payment of freights and the additional inducement of an extra 2 per cent discount. Was there ever a more striking illustration of the "wolf in sheep's clothing" than this circular letter of Messrs. John D. Park & Sons Co.? In the guise of injured innocence, Park calls upon the retailer for assistance; such audacity is unheard of in all annals of mercantile history. The retailer will not allow himself to be again deceived and caught by the miserable bait of 2 or more per cent. The wolf in sheep's clothing has been recognized and the baiting process, to defeat the efforts of the true and tried friend, the wholesaler, is a thing of the past. One need but read a little history

to be convinced that the firm of J. D. Park & Sons Co. are not the friends of the retail drug trade. According to the minutes of the United Drug Association of Cincinnati, O., a committee of three called upon this firm seeking their cooperation with the wholesale drug trade of this city in the re-establishment of full prices on all patent medicines. The firm, J. D. Park & Sons Co., flatly refused, saying, according to the minutes of the association, "Our interests are with the cutter and cutting. Our trade consists to the amount of 60 per cent of cutters and we prefer the cutter's trade to that of the legitimate retail druggist." Their opposition caused failure, not alone in Cincinnati, but in every large center of the United States. Every retail druggist has had a taste of cutting and has ascertained by this time that the wholesaler is his friend, and not the supporter of cutters, Messrs. J. D. Park & Sons Co. This firm realized this some time ago, and therefore the present appeal, "Come here to me, you retail druggists of the United States, give me your orders, I am your friend because I give you 2 per cent on the regular wholesale prices." The wholesale drug trade, in connection with the manufacturers, have exerted themselves to assist the retailer, and it depends upon the retailer to accept or refuse that support. To be misled by this sly circular of John D. Park & Sons Co. means absolute ruin to the retailer. The retail drug trade must operate under the principle, "Stand by your friends and withhold your orders from the enemy." Organize in every locality and join hands with the Interstate Retail Druggists' League.

C. T. P. FENNEL.

REMEDY FOR HARD TIMES.

Never keep money which is due to another. Simple as is this rule, there is none so generally disregarded. We have a large class in this community whose bank accounts would allow them to owe no man anything save charity and good will, yet who make it a matter of pride to pay no small debts save by lordly courtesy or at such times as it may please them to make a check to the marketman or the mechanic. To them it appears as though the good name they have always borne puts them above suspicion. They would pay instantly upon being dunned by the humble creditor, and the latter would await their pleasure months and borrow money rather than ask for his due, since to demand his own would be to lose their custom in future. If you cannot pay what you owe, or owe nothing, you have no duty in this respect; but if there is the least sum due for work or purchases see to it that the sun does not set to-night until that sum is put into circulation.

Spend all you can possibly afford to disburse. I give this advice boldly, says a writer in the Boston Transcript, although it is just to the contrary to that usually offered. But one does not have to be a political economist to see that the relief would be instantaneous. Debt is always to be avoided, but the last available dollar is a blessing to the community. What possible good does money do which is hoarded instead of being put into circulation? Suppose a man in the possession of an income of \$10,000 a year were to enter into one of our suburban villages and daily spend among his neigh-

bers that proportion which he would receive each day? I do not mean giving it right and left for the support of the poor or shiftless, but buying the labor or products of his poorer brethren. Does it require any instruction in political science to see that he would at once turn that town into a very paradise of prosperity? And if all those in comfortable circumstances would scrupulously do this, the dissemination of comforts would increase in proportion to the money spent. The philosophy of Benjamin Franklin has cursed this country with a mania for hoarding. We fail to realize that the identical economy which may be commendable in the young mechanic, may be a positive wrong in the retired merchant. Did you ever calculate the amount of good done by (let us call it the Franklin phraseology) the useless extravagance of inviting a lady to the theater? In the first place, in accepting, she will probably disburse for gloves, millinery or seamstress work quite a pretty sum, each payment being a blessing to the one who receives it, sometimes representing to the employe the very means of life. Then your own disbursement will help support the hack driver, the florist, the hotel where you dine together, while it would be impossible for the worthy corps of the employes of the theater to get their daily bread were it not for just such extravagance as that of which you are guilty.

To rigidly economize at such times as the present, so that you may have the means to give for benevolent purposes is simply to withhold with the one hand that you may disburse with the other. If the two rules herein recommended were observed by every person in the community, only the inebriate and the culpably shiftless would be a charge on their fellows. As intimated here, I do not in the least share the general commendation of Benjamin Franklin. His maxims are worldly, sensual, selfish, entirely ignoring chivalric, spiritual or lofty ideals. The effect of his parsimonious ideal of human conduct is to be seen in just such stringency as that which is now felt by the American people.

BOARDS OF PHARMACY.

Florida Board of Pharmacy convenes May 15 at Tampa for the examination of candidates for registration.

Connecticut Pharmacy Commission will hold its next meeting for the examination of candidates Tuesday, June 5, in the capitol at Hartford.

Louisiana Board of Pharmacy at its session held in New Orleans March 15, gave certificates of registration as qualified assistants to Chas. A. Lopez, E. F. Bacon, F. E. Wellbacher and G. Charbonnet, of New Orleans. Certificates as registered pharmacists were granted to H. J. Fournet, St. Martinsville; B. F. Holmes, Franklyn and C. G. Magruder, New Orleans.

Wisconsin Board of Pharmacy at a recent session in Green Bay elected H. C. Schranck, Milwaukee, president, and E. E. Helmstreet, Janesville, secretary-treasurer. Meetings for examinations were fixed as follows: Madison, June 13; Racine, August 17; Milwaukee, November 14; Milwaukee, January, 1895, Baraboo, March, 1895. One hundred and sixty-five candidates were examined by the board last year, out of which number thirty-two

licentiates of the first class and sixty-three second grade certificates were granted, while seventy were rejected. Thirty-seven licentiates from other states were granted certificates. There are in the state 1,133 first grade and 286 second grade registered pharmacists. Since the law was passed in 1882, 2,455 have been registered, and of this number 1,036 have been canceled by death, removal or retired from business.

The Virginia Board of Pharmacy at its eighth annual meeting held in Richmond, March 19, examined forty-two candidates, granting certificates as registered pharmacists to H. J. Brady, Baltimore, Md.; J. A. Booth, Stuart; Robt. L. Fruar, J. Virgil Tarrant, Richmond; Fred S. Boyd, Winchester; J. R. Connell, Lynchburg; E. L. Erb, Roanoke; J. S. Fitzhugh, Charlottesville; W. C. Ellett, Christiansburg. Registered assistants: W. R. Canbourne, Roanoke; H. R. Coleman, Charlottesville; S. J. Carson, Staunton; Samuel W. Stone, Robert C. Ruedy, Roanoke; W. E. Griffiths, Edmund Christian, Robert L. Booker, J. A. Garland, Richmond; T. A. Harrison, Manchester, and Robert E. Nelson, Norfolk. C. P. Kearfoot, of Martinsville, was appointed to succeed C. E. Fleet as a member of the board.

The legislature having materially amended the pharmacy law the board adjourned to meet at Blue Ridge Springs, July 10 to consider its provisions. T. A. Miller, of Richmond, was chosen president of the board.

PHARMACEUTICAL ASSOCIATIONS.

The Kentucky Pharmaceutical Association meets in Paris, May 16.

The Eastern Maine Pharmaceutical Association has been organized by the druggists of Bangor and vicinity. J. W. Taney is president and F. H. Tupper secretary and treasurer.

Santa Clara County, Cal., Retail Druggists' Association at its annual meeting held March 19, elected the following officers for the ensuing year: President, R. E. Collins, Sr.; vice-presidents, T. J. Riley, W. S. Johnston; secretary, J. G. Munson; treasurer, C. W. Fischer; executive committee, S. H. Wagener, L. Callish, G. G. Morehead, C. Perrin and E. H. Baker.

The Boston Druggists' Association met April 4 for the purpose of taking appropriate action upon the death of William J. Cutler. The following resolutions were presented and unanimously adopted by a rising vote:

Resolved, That as members of the Boston Druggists' Association, as well as on behalf of the trade which we represent, we desire to place on record our appreciation of the life and character of William J. Cutler, a member of this association from its organization and at one time its president. That we recognize the comprehensive and executive ability which characterized his faithful devotion to his public and private interests of his calling for more than sixty years. That we gratefully bear witness to his firmness of purpose, his ready friendliness and helpfulness to others, his courtesy, his absolute integrity, and his spotless character. That we tender to Mr. Cutler's family our sincere sympathy in a sorrow which we share with them. That a copy of these resolutions be furnished to Mr. Cutler's family and to the press.

The following gentlemen were appointed a committee to attend the funeral of Mr. William J. Cutler: Mr. Thomas Doliber, Mr. Joseph Burnett, Mr. Nathaniel J. Rust and Mr. Gorham D. Gilman.

The Nebraska Pharmaceutical Association meets in Hastings June 5. The local druggists are already making arrangements for the event and the local secretary says the meeting will be a complete success.

The Ohio Pharmaceutical Association meets in Cincinnati May 22. G. L. Hechler and Lewis C. Hopp, both Cleveland druggists, are president and secretary respectively. A. Wetterstroem, Columbus, is local secretary.

The Milwaukee, Wis., Drug Clerks' Association believe in frequent social gatherings. At a recent meeting H. I. Webber delivered an address on "Pharmacy" and Casper Henrici gave a recitation. E. Memecher, Jr., is the corresponding secretary.

COLLEGES OF PHARMACY.

The Pittsburg College of Pharmacy at its commencement exercises held in Carnegie Music Hall, Allegheny, March 29, conferred the degree of Ph. G. upon the following members of the graduating class:

Perry Linden Kerr, William Schuchmann, Wilbert Edward Corey, James Devan Thomas, Chas. David Aldenderfer, Theodore J. Hermann, Michael John Gross, John Reynolds Thompson, Charles John Kenah, Henry William Heckel, Henry August Spilker, Charles Adolph Schafer, George Scott Paisley, William Cannon Griffith, Edward F. Stephens, William Grant Young, William Thomas Gordon, Edward S. Allen, Robert W. Mackenzie, John A. Faessel.

Mr. Kerr took first honors, Messrs. Gross and Thompson second honors, and Mr. Faessel received the certificate of proficiency.

At a meeting of the college held Monday, March 26, the following officers were elected:

President, A. C. Robertson, vice-presidents, Louis Emanoel, Peter Weber; recording secretary, Louis Brehm; corresponding secretary, George W. Kutscher; curatorial secretary, Samuel Jamison; curator, J. A. Shaffer; librarian, T. F. Aschman.

MICHIGAN UNIVERSITY NOTES.

Shinichi Ando, Ph. C., '93, is chemist in charge of the Apollo Iron Works, Pa.

The Michigan Board of Health held a sanitary convention at Menominee April 5 and 6.

A. H. White, B. S., '93, has been appointed instructor in chemistry at Champlain University, Ills.

T. Griffen, Ph. C., '89, has been elected secretary of the Hoffman, Thompson Drug Co., successors to J. R. Hoffman & Co., Minneapolis. Mr. Griffen has charge of the recently equipped analytical laboratory which has been added to their manufacturing department.

Saccharin finds employment in disguising the taste of various fatty oils. The following for cod liver oil (Wiener Klinische Rund) has been suggested:

Saccharin	40 centigrams.
Acetic ether	2 grams.
Cod liver oil	100 grams.
Peppermint or cinnamon oil	q. s.

Dissolve the saccharin in the ether, and add the cod liver oil, little by little, with frequent agitations. Finally add the peppermint or cinnamon oil.

CORRESPONDENCE.

We accept no responsibility for the views and utterances of our correspondents. Contributions must carry full name and address of the writers, which, however, will not be published, if so requested. Copy should reach us ten days in advance of date of issue.

NEW YORK PAINT TRADE. A CORRECTION
To the Editor.

In a recent number of your esteemed journal I noticed an article on "Paint Trade Reorganized," and wish to correct what may be misleading to the paint trade throughout the country.

New York, for several years, has had a Paint, Oil and Varnish Club, with about seventy-five members of the paint, oil and varnish trade of New York City. A number of our membership were members of the New York Board of Trade and Transportation, and it was thought advantageous for us to form a paint, oil and varnish section of that board, which was done on the 20th of March last, and such members of our club as were members of the Board of Trade and Transportation are now the paint, oil and varnish section of that body. There was no reorganization. The officers of the section are: J. A. Elmendorf, of Edward Smith & Co., chairman; C. H. Patrick, of H. W. Johns Manufacturing Co., vice-chairman, and W. B. Templeton, of the Trade News Publishing Co., secretary and treasurer. The members of the executive committee are: Henry Merz, of Heller-Merz Co.; A. B. Garner, of Murphy Varnish Co.; R. Pyatt, of Rogers & Pyatt; William E. Lucas, George W. Portmayer, of the National Lead Co., and W. D. Eger, of A. B. Ansbacher & Co. The regular monthly meeting of the section is the first Tuesday in each month at 1:30 p. m. The object of the section is to add our influence to that of the Board of Trade and Transportation Company for all subjects that are for the good of trade in general. Our Paint, Oil and Varnish Club is entirely separate from this section. Yours very truly,

JOHN A. ELMENDORF.

LIQUOR SELLING IN MASSACHUSETTS.

To the Editor:

In your issue of April 1, pages 25 and 213, are rather startling statements regarding Massachusetts. The Board of Pharmacy of this state are required to make an annual report to the governor of the condition of pharmacy, and the statement in the Springfield Republican seems to the Board of Pharmacy to call for an investigation. Accordingly our agent was instructed to visit Westfield on account of a communication which appears in the Springfield Republican in regard to the liquor traffic carried on by the druggists in Westfield. Upon inspecting the town six stores made the complete quota in lawful condition. As regards the startling report referred to, the facts are these: Westfield voted no license last year, the result being sixteen rum shops closed up. Therefore, upon licensing the six druggists, their trade naturally increased at first, were they ever so careful. A committee comes around under the pretext of simply wishing to inform themselves in regard to the working of the license law. This was after the first week in July. Not knowing that the said committee was in the interests of the saloonkeepers, the druggists let them take

books containing the sales of liquor up to that time. After two days they were returned to them, and nothing more was heard of the matter until the communication of the Springfield Republican, which was prepared and kept for a campaign document, which was sprung by the friends of the saloons and served its purpose, as the election which took place this day shows the verdict, being Westfield's votes for license. The druggists' declaration was that for the year their sales had not increased 10 per cent, that for the first year of license the arrests for being drunk were 175, for the year of no license not quite 100. This is a verbatim copy from the March report of our agent, and is sent to you in justice to the druggists of Westfield, and, as we believe, a true statement of all the facts.

H. M. WHITNEY,

President of the Board of Registration in Pharmacy.

WHAT THE DRUGGIST MUST KNOW.

Wine ounce hourhoned 5 cents.

Abes tea

Katon

Eits mecel to rob in the had

Castl fist

Coterime to put in closet.

S. A. EPSTEIN,

Chelsea, Mass.

Poder of Pur Oxed Hiderjen

White charcoal

DIRECTORY OF BOARDS OF PHARMACY.

For full information, dates of meetings, etc., address the secretaries of the respective boards.

Alabama.—P. C. Candidus, Mobile, president; J. W. Milner, Florence; E. P. Gait, Selma, secretary.

Arizona.—Has no pharmacy law.

Arkansas.—J. M. Anderson, Pine Bluff, president; F. G. Kerr, Van Buren; W. L. Carr, Hot Springs; J. M. Colburn, Little Rock; W. W. Kerr, Russellville, secretary.

California.—S. H. Melvin, Oakland, president; J. H. F. Hart, Maryville; W. M. Searby, San Francisco; J. W. Wood, Pasadena; H. J. Finger, Santa Barbara; R. J. Van Voorhles, Sacramento; J. H. Dawson, San Francisco, secretary.

Colorado.—Chas. M. Ford, Denver, president; C. H. Wells, Pueblo; F. H. Arcularius, Colorado Springs, secretary.

Connecticut.—C. A. Rapelye, Hartford, president; J. H. Grannis, M. D., Saybrook; Henry M. Elshop, New Haven, secretary.

Delaware.—W. H. Cooper, Kenton, president; O. G. Robinson, —; J. H. Spruance, Wilmington; E. Hoffmann, Wilmington; C. D. Sypher, Dover, secretary.

District of Columbia.—D. W. Prentiss, president; F. G. C. Simms, I. T. Wenter; R. L. Elliot, Washington, secretary.

Florida.—J. D. Palmer, Monticello, president; H. C. Cushman, Pensacola; S. B. Leonard, Tampa; F. Clarke, Jacksonville; E. Delouet, Ocala, secretary.

Georgia.—J. W. Goodwyn, Macon, president; S. C. Durban, Augusta; H. Sharp, Atlanta; George F. Payne, Macon; H. R. Slack, Jr., La Grange, secretary.

Idaho.—Has a pharmacy law empowering each county to organize its own board.

Illinois.—T. N. Jamleson, president, Chicago; L. C. Hogan, vice-president, Englewood; H. H. Green, Bloomington; I. N. Coffee, Cairo; A. Zimmermann, Peoria; Frank Freury, secretary (not a member), Springfield.

Indiana.—Has no pharmacy law.

Iowa.—J. H. Mitchell, Bloomfield, president; F. Howard, Sheldon; J. H. Pickett, Oskaloosa; S. J. Spaulding, Des Moines.

Kansas.—F. E. Holliday, Topeka, president; J. T. Moore, Lawrence; W. C. Johnson, Manhattan; W. E. Sheriff, Ellsworth; H. W. Meh, Leavenworth, secretary.

Kentucky.—J. W. Fowler, Louisville, president; W. S. Johnson, Henderson; W. G. White, Richmond; E. Y. Johnson, Louisville; W. Rogers, Louisville, secretary.

Louisiana.—T. J. Labbe, St. Martinsville, president; P. L. Viallon, John Gazzo, R. T. Gibbs, L. F. Challin, F. C. Goibold, Wm. Graner, F. T. Royer; Walter T. Taylor, New Orleans, secretary.

Maine.—E. H. Thompson, Searbro Beach; N. C. Earl, Portland; F. R. Partridge, Augusta, secretary.

Maryland.—D. M. R. Culbreth, president; E. Barickson; J. F. Hancock, secretary. (Law applies to Baltimore alone.)

Massachusetts.—H. M. Whitney, Lawrence, president; J. Larrabee, Melrose; A. K. Tilden, Boston; J. A. Rice, West Adams; F. H. Butler, Lowell, secretary.

Michigan.—O. Eberbach, Ann Arbor, president; G. Gundrum, Ionia; C. A. Bugbee, Cheyboygan; F. W. R. Perry, Detroit; Stanley E. Parkill, Owosso, secretary.

Minnesota.—W. A. Frost, St. Paul, president; J. H. Salls, Lake Crystal; H. P. Barclay, Stillwater; W. S. Getty, St. Paul; H. G. Webster, Minneapolis, secretary.

Mississippi.—B. Lemly, Jackson, president; J. B. Small, Winona; J. M. Kimbrough, Meridian; J. W. Eckford, Aberdeen; J. C. Means, Natchez, secretary.

Missouri.—A. T. Fleischmann, Sedalia, president; A. R. Edmonds, Miami; F. W. Sennewald, St. Louis, secretary.

Montana.—Has no pharmacy law.

Nebraska.—J. Reed, Nebraska City, president; W. D. Haller, Blair; C. M. Clark, Friend; G. J. Evans, Hastings; M. E. Schultz, Beatrice, secretary.

Nevada.—Has no pharmacy law.

New Hampshire.—C. A. Tufts, Dover, president; E. H. Currier, Manchester; G. F. Underhill, Concord, secretary.

New Jersey.—W. R. Laird, Jersey City; A. Drescher, Newark; W. C. Alpers, Bayonne; G. W. C. Phillips, Jersey City; A. S. Elwell, Bridgeton, secretary.

New Mexico.—W. C. Porterfield, president, Silver City; E. G. Murphey, Las Vegas; C. M. Creamer, Santa Fe; E. W. Spencer, Albuquerque; J. L. Zimmermann, East Las Vegas, secretary.

New York.—A. B. Huested, Albany, president; C. H. Haskin, Rochester; F. L. Norton, Delhi; J. C. Smith, Plattsburg; E. S. Dawson, Jr., Syracuse, secretary.

North Carolina.—H. R. Horne, Fayetteville, president; W. H. Wearn, Charlotte; A. W. Rowland, Wilson; E. V. Zoeller, Tarboro; W. Simpson, Raleigh, secretary.

North Dakota.—H. E. White, Jamestown, president; H. L. Haussamen, Grafton; W. S. Parker, Libson, secretary.

Ohio.—F. T. Bower, Toledo, president; C. Krone, Hamilton; J. Meyer, Cincinnati; C. E. Ink, Columbiana; W. R. Ogier, Columbus, secretary.

Oklahoma.—A. F. Masterman, El Reno, president; J. M. Craig, Guthrie; C. P. Wickmiller, El Reno, secretary.

Oregon.—M. M. Davis, Yaquina City, president; A. A. Jones, Baker City; S. P. Gould, Pendleton; W. B. Welch, Portland; D. J. Fry, Salem, secretary.

Pennsylvania.—A. Robbins, Philadelphia, president; L. Emanuel, Pittsburg; A. J. Tafel, Philadelphia; A. B. Burns, Montrose; C. T. George, Harrisburg, secretary.

Rhode Island.—W. B. Blanding, Providence, president; W. E. Clarke, Providence; N. N. Mason, Providence; J. H. Taylor, Newport; A. B. Collins, Westerly; H. M. Dudley, Woonsocket; E. C. Danforth, Providence, secretary.

South Carolina.—E. S. Burnham, Charleston, president; A. A. Kroeg, Charleston; J. S. Duffie, Columbia; A. Memminger, J. Forrest, H. W. Hummel, Charleston, secretary.

South Dakota.—A. H. Stiles, Sioux Falls, president; C. F. Ayer, Howard; O. H. Tarbell, Watertown; I. A. Keith, Lake Preston, secretary.

Tennessee.—R. H. Gordon, Nashville, president; J. F. Voigt, Chattanooga, vice-president; A. A. Yeager, Knoxville; L. Laurensen, Memphis; J. O. Burge, Nashville.

Texas.—Has a separate board for each senatorial district.

Utah.—F. A. Druehl, Salt Lake City, president; W. A. Wade, Brigham City; F. B. Hurlbut, Ogden; H. S. Pyne, Provo; C. H. McCoy, Salt Lake City, secretary.

Vermont.—Has no pharmacy law.

Virginia.—C. B. Fleet, Lynchburg, president; C. A. Santos, Norfolk; T. Ashby Miller, Richmond; Robert Brydon, Danville; E. R. Beckwith, Petersburg, secretary.

Washington.—A. M. Stewart, Tacoma, president; C. F. Krum, Spokane; C. G. Snyder, Davenport; L. D. Collins, New Whatcom; W. H. T. Barnes, Seattle, secretary.

West Virginia.—O. P. Sydenstricker, Lewisburg, president; J. W. Brown, Charleston; G. W. Dudding, Hurricane; J. G. McLain, Wheeling, secretary.

Wisconsin.—J. Rosch, Menasha, president; H. C. Schranck, Milwaukee; C. R. Bechmann, Fountain City; H. O. Frank, Milwaukee; E. B. Helmstret, Jamesville, secretary.

Wyoming.—W. C. Wilson, Jr., Laramie, president; F. P. Shannon, Carson; A. R. Troxell, Cheyenne, secretary.

PATENTS, TRADE-MARKS AND DESIGNS.

- 515,473—Device for Closing Bottles.—Richard Herz, Vienna, Austria-Hungary.
- 515,504—Atomizer.—John H. Scharlink, Newark, N. J.
- 515,556—Bottle-Washer.—William J. Smeatlie, Amsterdam, N. Y.
- 515,559—Display-Counter.—William L. Sontak and Robert A. Brennan, Evansville, Ind.
- 515,597—Toilet Vaporizing Apparatus for the Complexion.—Bottle H. Owens, Denver, Colo.
- 515,605—Bottle-Stopper.—Albert Stutzer and Julius Schafer, Bonn, Germany.
- 515,700—Germ-Proof Filter.—Algeron L. Wilkinson, Sr., Richmond, Va.
- 515,705—Hypodermic Syringe.—John W. Dally, Boston, Mass.
- 515,721—Bottle-Wrapper.—Theodore F. W. Schmidt, Dayton, Ohio, assignor to one-half to the Dayton Paper Novelty Company, same place.
- 515,764—Red Azo Dye.—Arthur G. Green, London, England, assignor to Brooke, Simpson & Spiller, Limited, same place.
- 515,889—Process of and Apparatus for Distilling and Refining Volatile Substances and Essential Oils.—Albert M. Todd, Kalamazoo, Mich.
- 515,894—Filtering Apparatus.—Wilhelm Balz, Plouheim, Germany.
- 515,895—Process of Making Alumina.—Karl J. Bayer, Elabuga, Russia.
- 515,897—Polyzazo Dye.—Johann J. Brack, Basle, Switzerland, assignor to L. Durand, Huguenin & Co., St. Pons, France; Basle, Switzerland, and Hueningen, Germany.
- 515,909—Art of Manufacturing Ammonia.—Hans A. Frasch, Cleveland, Ohio.
- 515,930—Bottle-Sealing Device.—George A. Boyden, Mount Washington, Md.
- 516,075—Process of Making Soda Crystals.—Herbert R. Browne, Cadesthead, assignor to himself and Malcolm Guthrie, Liverpool, England.
- 516,235—Toilet-Paper Holder.—Allen N. Spooner, Jersey City, N. J.
- 516,238—Suspensory Pouch.—Aleck Bauer and Theodore W. Heinemann, Chicago, Ill.
- 516,338—Phenol-Bismuth Compound.—Bruno R. Seifert, Radebuhl, Germany, assignor to Dr. F. von Heyden, Nachfolger, same place.
- 516,401—Inhaler.—Theophilus G. H. Nicholson, Liverpool, England.
- 516,448—Inhaler.—William H. Russell, New York City, and Harvey C. Earl, New York, N. Y.
- 516,590—Apparatus for Carbonating Liquids.—Charles F. A. Convert, Chicago, Ill.
- 516,708—Oil-Purifying Apparatus.—Charles H. Freyer, London, England.

516,707—Paratolydimethylpyrazolone.—Ludwig Knorr, Jena, assignor to the Farbwerke, vormals, Meister, Lucius & Brunling, Hoechst-on-the-Main, Germany.

516,752—Diamido Base.—Johann J. Brack, Basle, Switzerland, assignor to L. Durand, Huguenin & Co., St. Pons, France; Basle, Switzerland, and Hueningen, Germany.

516,753—Diamido Base.—Johann J. Brack, Basle, Switzerland, assignor to L. Durand, Huguenin & Co., St. Pons, France; Basle, Switzerland, and Hueningen, Germany.

516,754—Diamido Base.—Johann J. Brack, Basle, Switzerland, assignor to L. Durand, Huguenin & Co., St. Pons, France; Basle, Switzerland, and Hueningen, Germany.

516,755—Diamido Base.—Johann J. Brack, Basle, Switzerland, assignor to L. Durand, Huguenin & Co., St. Pons, France; Basle, Switzerland, and Hueningen, Germany.

516,756—Red Tetrazo Dye.—Johann J. Brack, Basle, Switzerland, assignor to L. Durand, Huguenin & Co., St. Pons, France; Basle, Switzerland, and Hueningen, Germany.

516,757—Blue Tetrazo Dye.—Johann J. Brack, Basle, Switzerland, assignor to L. Durand, Huguenin & Co., St. Pons, France; Basle, Switzerland, and Hueningen, Germany.

516,758—Blue Tetrazo Dye.—Johann J. Brack, Basle, Switzerland, assignor to L. Durand, Huguenin & Co., St. Pons, France; Basle, Switzerland, and Hueningen, Germany.

516,759—Red Tetrazo Dye.—Johann J. Brack, Basle, Switzerland, assignor to L. Durand, Huguenin & Co., St. Pons, France; Basle, Switzerland, and Hueningen, Germany.

516,760—Blue Tetrazo Dye.—Johann J. Brack, Basle, Switzerland, assignor to L. Durand, Huguenin & Co., St. Pons, France; Basle, Switzerland, and Hueningen, Germany.

516,766—Process of Making Ether.—Friedrich Kraft and Alfred Roos, Heidelberg, Germany.

516,811—Inhaling Apparatus.—Wilhelm Scheerer, Tuttingen, Germany.

516,812—Speculum.—Wilhelm Scheerer, Tuttingen, Germany.

517,073—Micrometer-Callipers.—John D. Sloane, St. Paul, Minn., assignor to Gertrude Duval Sloane, same place.

517,068—Process of Making Concentrated Nitric Acid.—Hans A. Frasch, Cleveland, Ohio, assignor to the Grassell Chemical Company, same place.

Expired February 27, 1894.

187,751.—Apparatus for Recovering Waste Alkalies.—J. W. Dixon, Philadelphia, Pa.

187,802—Disinfecting Compounds.—H. J. Bang, New York, N. Y.

187,855—Fluid Meats.—John L. Johnstone, Sherbrooke, Quebec, Canada.

187,881—Apparatus and Processes for Manufacturing Purified Saccharine Solutions.—A. Maubres, Penze, England.

187,897—Stove Polish.—D. W. Parker, Cambridge, Mass.

Expired March 6, 1894.

187,956—Compositions for Preserving.—C. G. Am Ende, Hoboken, N. J.

188,217—Process of Making Dyes From Naphthaline.—Justus Wolff, Wyke, near Bradford, and Ralph Betley, Wigan, England.

Expired March 13, 1894.

188,226—Pomade.—Mack Culbertson, Lake City, Minn.

188,271—Filters.—Geo. W. Woolsey, Toledo, Ohio.

Expired March 27, 1894.

188,891—Apparatus for Manufacturing Hydrated Sulphurous Acid.—W. Davidson Jones, Hazarman's Mills, N. Y., assignor of one-half his right to H. H. Pawling, same place.

189,065—Machines for Making Pills, Lozenges, Etc.—T. J. Young, Philadelphia, Pa., assignor to H. Bowser, same place.

Belows.

7,529—Processes of Purifying Paraffine Wax.—E. N. Byerly, Cleveland, Ohio.

TRADE MARKS.

24,277—Dye Stuffs.—L. Durand, Huguenin & Co., Basle, Switzerland. The word "Gallazine."

24,280—Liniment for External and Internal Use.—Joseph Miles Vost, Charles F. Green, and Frank C. Houck, Williamsport, Pa.

24,281—Natural Mineral Water.—Stafford Mineral Springs and Hotel Company, Limited, New Orleans, La. The representation of a heart having a band across it and the word "Ho-Go-Ha-Ma" on the band.

24,283—Castile Soap.—California Olive Oil Soap Company, New York, N. Y. The representation of an olive tree.

24,284—Shaving Soap.—The J. B. Williams Company, Glastonbury, Conn. The words "Travelers' Favorite."

24,285—Shaving Soap.—The J. B. Williams Company, Glastonbury, Conn. The word "Luxury."

24,286—Toilet Soap.—The J. B. Williams Company, Glastonbury, Conn. The words "White Cross."

24,287—Face Powder.—Henry Tetlow, Philadelphia, Pa. The word "Gossamer."

24,312—Mineral Spring Water.—The Lenape Springs Company, Philadelphia, Pa. The word "Lenape" and the representation of an Indian chief.

24,313—Tonic.—Hazzard, Hazzard & Company, New York, N. Y., and Newport, R. I. The words "Mensman's Peptonized Beef Tonic."

23,314—Witch Hazel Distillate.—Connecticut Witch Hazel Company, Chester, Conn. The words "Hazel Bloom."

24,315—Pharmaceutical Product.—L. Durand, Huguenin & Co., Basle, Switzerland. The word "Gallanol."

24,316—Pharmaceutical Product.—L. Durand, Huguenin & Co., Basle, Switzerland. The word "Galloborol."

24,317—Chemical Compound for Medicinal Purposes.—The New York and London Alkaloid and Chemical Company, New York, N. Y. The word "Quinophen."

24,318—Remedy for Coughs, Colds, Consumption and Other Diseases of the Throat and Lungs.—Edward H. Fienhold, Philadelphia, Pa. The word "Murdoleum."

24,319—Remedy for Indigestion, Dyspepsia and Similar Affections.—Finley R. Butterfield, Concord, N. H. The representation of a Puritan maiden and the word "Puritana."

24,320—Remedies for Diseases of the Stomach and Bowels.—Sultan Drug Company, St. Louis, Mo. The word "Seng."

24,321—Preparation for Female Diseases Done up in a Ball and Wrapped in Tin Foil.—Caroline E. Langworthy, Greenwich, N. Y. The word "Sachets."

TRADE COMMENT.

The olive oil production of California is estimated at 12,000 gallons for 1892, and the importations into the United States during the same period were 706,486 gallons.

A steel casting trust has been formed for the purpose of reducing (?) the price of steel castings to the consumer. The promoters of the enterprise also say that it isn't a trust, anyway—it's simply an organization.

The Iowa House of Representatives has passed a bill prohibiting the coloring of imitation butter with yellow coloring matter. This is apparently in line with similar legislation in another state requiring such products to be colored pink.

A Bordeaux (France) pharmacist, upon joining the ranks of the cutters, adulterated his wares to correspond with the cut in prices. He is now spending his time in prison, and at the expiration of his two-years' sentence will undoubtedly have different views upon the cut-rate evil.

It is announced that the Sulphur Mines Company, of Virginia, the Atlantic & Virginia Fertilizer Company, of Richmond, Va., and the Monumental Chemical Company, of Baltimore, have consolidated, and the combined business will be conducted by the first named company.

Up to the middle of March the season's production of cod liver oil at the Lofoden Islands amounted to about 5,000 hectoliters of refined oil, against 12,800 hectoliters last year. As the season is now at a close, there is no possible means of making up the deficit.

Count Orloff-Davidoff has offered a prize of \$5,000 to be awarded in 1899 by the Imperial Institute of Experimental Medicine of St. Petersburg, Russia, for a certain remedy or protection against the cattle plague, which every year causes such great mortality among the herds of that country.

What is apparently a blow aimed at the methods of several corporations is a bill lately introduced in the New York Senate by Senator Collins, compelling corporations which issue rebate vouchers to deposit in New York banks such sums as shall equal in amount the said rebate vouchers or certificates.

A simple relief for writer's cramp is suggested by Langes (Munich Med. Wochenschr.), who directs that the pen be held between the second and third fingers in such a way that the holder rests upon the latter at an angle of from 110 to 125 degrees, while it is supported below by the thumb, the index finger resting lightly above.

The Supreme Court of Georgia held, in the recent case of Briscoe et al. vs. Montgomery et al., that a "commercial traveler" whose business is to travel and sell goods for his employer, though employed and paid for his services by the day, is not a "day laborer" in the sense in which the words are used in section 3554 of the Georgia code, and that his wages are not exempt from the process of garnishment.

Judge Grosscup handed down a decision at Chicago on March 5 in the patent suit of the American Soda Fountain Co. vs. Hart Manufacturing Co. in favor of the latter firm.

That there are two strong sides to every question wherever there is more than one interest involved is pointed out by Henry Lyman in a recent communication to the Montreal Pharmaceutical Journal. The newspapers of Ottawa have been bringing some pressure to bear upon the Canadian government, with a view of reducing the protective tariff, which the Dominion now has in force, upon the plea that it lessened the sale of goods from the United States and thus lessened the income of the newspapers from advertising. Mr. Lyman, from a Canadian point of view, points out the benefits derived from the necessity which compels many prominent houses of this country to equip and maintain in Canada branch establishments, involving large outlay for buildings, wares, etc., thus conferring a direct benefit upon the citizens of that country. Surely the losses of Peter are the wages of Paul.

The German Apotheker-Verein is now having a chance to demonstrate its usefulness by combating a bill which was lately introduced by a cabinet officer in the Prussian Chamber of Deputies for the purpose of abolishing the present system by which the number of pharmacies is made to bear a certain ratio to the population. This system, while regarded with favor by pharmacists both in Germany and other countries as a means of enabling the pharmacist to elevate the professional aspect of his calling by doing away, to a certain extent, with the evils following unrestricted competition, is denounced by the author of the bill as a method which fosters favoritism of the grossest kind and has led to the most notorious speculations in concessions. As this system has so long been held up to the American pharmacist as an ideal one, the outcome of this movement against it will be awaited with considerable interest.

The world's supply of crude phosphate and guano, as given in the best official sources, is as follows: South Carolina, 560,000 tons; Florida, 425,000 tons; Belgium, 400,000 tons; France, 400,000 tons; West Indies, guano, 30,000 tons; South America, guano, 45,000 tons; Russia, 70,000 tons; Germany, 50,000 tons; Spain, 40,000 tons; England, 30,000 tons; Canada, 15,000 tons; Norway, 20,000 tons, and North Carolina, 2,000 tons; total, 2,087,000.

The world's consumption of commercial manures is as follows: United States, 1,225,000 tons; France, 1,000,000 tons; Germany, 1,445,000 tons; Great Britain, 1,600,000 tons; other European countries, 800,000 tons; total, 5,470,000 tons. The consumption in Germany of the various kinds of fertilizers is given as: Acid phosphates, 500,000 tons; slag, 250,000 tons; bone meal, 70,000 tons; sulphate of ammonia, 50,000 tons; potash salts, 220,000 tons; nitrate of soda, 250,000 tons; precipitated phosphates, 5,000 tons; total, 1,445,000 tons.

Massachusetts legislators are struggling with a bill which imposes a penalty of \$500 on anyone who shall paint on any building, other than that in which the business is being conducted, any patent medicine or other advertisement in which the letters or characters are more than six inches in length or four inches wide. The bill is intended as a prevention against the disfigurement of rural scenery.

Lieut. Elsdale, an English writer, enumerates the following as important problems which will probably approach solution during this generation or the next: (1) Aerial navigation, which, at the rate of progress of the last fifteen years, may be confidently counted as an accomplished fact within a like period in the future; (2) the diminution of the waste power due to surface friction of vessels; (3) the direct conversion of coal into electricity; (4) the reduction of vegetable food, now suited only to domestic animals to a condition fitted for the human palate and digestion. To these might be added changes in our social conditions to which the present state of unrest seems most certainly to point. The subjects of finance and taxation even in the light of history are receiving an amount of attention such as they never received before. The "tendency of the times" is losing its application as a mere phrase to explain conditions not fully understood, as is shown by the continual inquiry as to why things are tending in certain directions. The chemist, electrician and political economist now have their hands full; their ranks are not really crowded, and there is no prospect of their joining the forces of the unemployed for at least several centuries to come.

Up to the present time it has generally been accepted that the biblical manna was identical with a substance that oozes out of the tamarisk branches near Mt. Sinai. This has recently been denied by L. Errera, who, at the instigation of the Belgian Academy, undertook an examination of the "Bread of Heaven," which, in 1890, fell near Diabekir. In May of that year Diabekir and the region of the upper Tigris experienced a terrible storm, during which in addition to heavy hail, a thick coating of an edible substance also fell upon the ground. The latter had happened in this neighborhood before, and was called by the Kurds "Bread of Heaven." Baked with flour, they were accustomed to it. The consul at Aleppo sent specimens of this find to the Ministerium at Brussels, and these entrusted Errera with the microscopical examination of the substance. It turned out to be a kind of lichen (*Lecanora eulenta*), which is found, also, in Persia, Palestine and Algiers, and sometimes covers the ground to height of fifteen to twenty centimeters. The substance examined was of a light brown color, chemical analysis showed that it contained but little nutritive qualities. Errera is fully convinced that this "Bread of Heaven" is the manna of the Bible, mentioned in Num. 11, 8.—Independent.

INDUSTRIES OF THE U. S.

The extra Census Bulletin, No. 67, issued March 15, 1894, presents for each state and territory of the United States the statistics concerning all classes of mechanical and manufacturing industries as reported in the eleventh census. The tabular statements include only establishments which reported a product of \$500 or more in value during the census year ending May 31, 1890, and the figures can therefore be regarded as only approximate. The comparative estimates are based upon 322,624 establishments reporting in 1880, against 253,502 in 1890, an increase of 27.27 per cent. The figures for 1890 shows capital invested \$6,138,716,694, against \$2,789,766,886 in 1880, an increase of 120.76 per cent; total wages, 1890, \$2,171,586,919, against \$929,462,256 in 1880, an increase of 131.13 per cent. The total number of employes are given as 4,476,091 in 1890, and 2,790,732 in 1880, an increase of 63.71 per cent. The value of products amounted to \$9,654,435,337 in 1890, against \$5,349,191,458 in 1880, an increase of 89.27 per cent. The latter figures cannot be taken as indicating the correct contribution to the wealth of the country, as the products of one industry very frequently become the raw material for another, this being continued through several processes of manufacture. The table arranged in the alphabetical order of the various industries shows 563 chemical establishments reporting with an aggregate capital of \$55,022,452, employing 16,552 people, paying wages to the amount of \$9,691,813, using materials costing \$33,894,357, and turning out products valued at \$39,352,548. In the chocolate and cocoa business, 11 establishments reported with a capital of \$2,630,607, employing 663 people, paying wages amounting to \$396,694, using material costing \$2,892,219, and producing goods valued at \$4,221,675. Sixty-five establishments reported in the cork-cutting industry, having a total capital of \$1,829,360, employing 2,138 people, paying wages amounting to \$762,518, using material worth \$1,501,962, and turning out product valued at \$2,840,359. In the manufacture of druggists' preparations, not including prescriptions, 1,805 establishments with an aggregate capital of \$4,624,814 are reported. They employ 3,949 people, paying wages amounting to \$1,938,790, and turned material worth \$2,411,851 into products worth \$6,659,797. Thirteen drug-grinding establishments, with a capital of \$337,883, and 173 employes, receiving wages amounting to \$103,594, are reported as converting \$192,321 worth of material into \$466,796 worth of finished product. The dye stuffs and extract industry shows 60 establishments with capital of \$8,590,096, employes 2,227, wages \$1,275,649, material \$8,819,498, product \$19,114,714. Patent medicines and compounds show 1,127 establishments, capital \$18,596,823, employes 9,380, wages \$5,094,292, raw material \$11,030,916, finished product \$22,620,182. Perfumery and cosmetics show 157 establishments, capital \$2,238,501, employes 1,755, wages \$877,679, raw material \$2,128,420, finished product \$4,620,141. The soda water apparatus business shows 12 establishments, capital \$3,354,928, employes 593, wages \$728,121, raw material \$1,016,292, finished product \$2,711,879. Caster oil has 7 establishments reporting, capital \$621,798, employes 101, wages \$70,131, material \$431,231, product \$573,963. Essential oils, 67 establishments, capital \$102,222, employes 220, wages \$37,492, material \$129,735, product

\$25,847. Linseed oil, 62 establishments, capital \$14,063,358, employes 2,073, wages, \$1,286,062, raw material \$19,374,543, product \$23,534,396. Cottonseed oil and cake, 119 establishments, capital \$12,808,996, employes 6,301, wages \$1,507,827, material, \$11,363,126, product \$19,335,947. Although the drug and chemical trade can take considerable interest in these figures, and the aggregate amounts are not so large as to be hard of comprehension, yet there are other figures in these tables which show what an enormous amount of wealth it requires for a year's existence by the people of the United States. For instance, the meat production amounted to \$661,656,925; flour and grist mill products to \$513,571,471; clothing, \$503,258,556; boots and shoes, \$273,893,498; iron and steel, \$430,954,348; cotton goods, hosiery, etc., \$335,222,737.

POTATO WINE.

About six years ago attention was called to the fact that an attempt was being made by an ingenious English chemist to manufacture so-called wine from the ordinary potato. That the project did not receive the amount of success that its designer anticipated may be inferred from the silence that has since reigned as to its merits. We now hear, says an English exchange, that the mantle of the aforesaid inventor has fallen upon the shoulders of a Frenchman named Moutine, who claims to have found out a process by which a pleasant beverage of a wine character, can be made out of a combination of malt and potatoes, the cost of which only reaches the modest price of 11-24 per gallon. We regret that we have not yet had an opportunity of tasting the seductive fluid in question, and, therefore, are unable to give an opinion as to whether or not it is dear at the price. Nevertheless, we have been favored by a correspondent with the receipt for its manufacture, and this we place at the disposal of our readers.

"First grind the potato and then press it well to remove every drop of water, by which means other substances, which might infuse a bitter taste to the beverage, are also got rid of. The remaining starch, in combination with malt, produces grape-sugar. The must, secured by the reaction of the malt, is filtered and transferred by steam and high pressure to a special boiling apparatus, invented by Moutine, and used by him for the fermentation of all beverages. The temperature is raised under pressure to 130 to 150 degrees, and kills all fermenting matters; the albumen coagulates, and the grape-sugar becomes a kind of caramel, which gives an agreeable taste to the drink. The boiling process at five to six atmospheres finished, the temperature is reduced to 25 degrees, and the fermentation is produced by lees of wine."

Should this beverage eventually come into consumption among the peasantry of France, it will afford one more shock to the delicate susceptibilities of Sir Wilfred Lawson & Co., who will henceforth have to regard the potato and vine with equal aversion.

The business of Dr. J. A. Deane & Co., manufacturers of Dr. Deane's Dyspepsia Pills, Kingston, N. Y., has been incorporated under the name of the Dr. J. A. Deane Co. The office will continue as heretofore at Kingston, N. Y.

GERMAN EXPORT UNIONS.

The first factor in helping to secure foreign markets for German manufactures, apart from the almost absolute necessity of having such markets, is the great interest taken, even by inland cities, to secure foreign trade.

All over the empire are societies organized to encourage colonization and export trade. These unions are active agents in helping to extend foreign markets. Their methods are simple, and thus far have been very successful. They are endorsed by the press, authorities and people.

They project all kinds of schemes for bringing German wares to the notice of foreigners. Emigrants and Germans resident in foreign countries are enlisted in favor of German products. The Saxon Export Union has opened a permanent sample exhibit of German wares in Bulgaria. The almanacs published and circulated contain hundreds of names of German firms, with illustrations of their products. The purpose is to keep the Bulgarians posted as to Germany's ability to supply every possible need in the way of manufactures. Since its organization in 1887 the union has spent \$25,800 for traveling agents, etc. It has sent out 135,000 printed circulars and 94,000 letters of correspondence. In return it has received 7,000 sample orders, amounting to \$1,071,000.

To illustrate German energy in seeking foreign trade, we have only to take Russia during the strained relations of the past nine months. In drugs, iron, machinery, leather, silk and woolen goods Germany has beaten her last year's record by \$11,424,000. This has been done during a time of business depression, when the press was pouring out complaints about the backwardness of business, the stopping of factories, etc.; at a time, too, when a tariff war was being waged between the two empires. Especially worthy of note is the fact that Russia took from Germany during the first nine months of 1892 in machinery alone \$21,919,800 worth, against \$30,801,200 during the same period in 1891. This in face of the fact that Russia's import duties on German goods have gone up 50 per cent, giving England, the United States and Austria a tremendous advantage.

A German correspondent in St. Petersburg writes his paper in Chemnitz to tell his people how the thing has been done:

"In spite of differential duties, in spite of the activity of our rivals and competitors, Germany has sold her machinery because (1) of her credit system and (2) because her agents and exhibitors beat those of all other nations. We are the only people that seem never to tire of giving the Russians credit. In a country poor in capital but vast in undeveloped resources this fact settles it. It is the weak and, at the same time, the strong side of our export of foreign trade. Against the millions made are millions lost. The conservative German, alongside of the cautious Frenchman and often as cautious Englishman, risks, wins and remains in markets where his rivals offer for cash much cheaper than he can on credit. In countries like Russia credit plays as important a part as, if not a more important part, than price. Here, as elsewhere, only the rich can buy cheap."

The German possesses the faculty and power to put himself in the other man's

place; to understand his conditions and circumstances; to find out, if not feel, his needs. So great is his power in this respect that he has absolutely no rival or competitor worth considering. Not only does he study the language of the people among whom he is to work, but he makes a speciality of it and of their agricultural and industrial needs. When selling needles and pins, he may be watching where to sell a knitting machine or a plow. Not only this, but his education fits him to tell the buyer what is best suited to certain kinds of work, especially where it is a question of introducing anything new. It is a notorious fact that the Russian farmer buys from a German in preference to an Englishman, an American or even a Russian manufacturer. The German language, after Russian, is the most used in business circles, partly because there are so many Germans settled in Russia and partly because of proximity. Again, the German not only seeks to find out what the people want, but he sells machines and parts of machines, so that when injured or broken they may be easily and at once repaired—a very great consideration. German agents and traveling salesmen are willing to work hard to sell small quantities. This makes them popular among the people to whom they are sent and satisfactory to their employers."

For so old a country the progress of the last twenty years seems incredible. The impulses of her unions, the energy of her agents, the patriotism of her people, the co-operation of her governments, the education furnished by her schools, the excellence of her products, the faithfulness with which orders are filled and the wisdom with which each people's wishes are met, are only a few of the many factors that make the empire rich, prosperous and progressive. The nation's interest in foreign trade is intense. The newspapers teem with all kinds of information regarding it. Not a day passes that a consul could not find information valuable to our merchants and manufacturers. On my table at this moment are editorials out of the local papers covering the empire's commerce with many foreign countries. I pick up one at random—Puerto Rico.

Puerto Rico bought last year 157 tons of linen and cotton goods, worth \$38,343.35. Of this quantity England sent 61, the United States 47, Spain 24 and Germany, France and Italy together 19 tons. Of chemicals, a very costly commodity, Germany sent 10, France 29, Spain 14, the United States 14, England 7 and Belgium 3 tons. Of paraffin and stearin, Germany sent 43, Spain 135 and England 10 tons. Of writing and printing paper, Spain sent 107, England 23, the United States 21, Germany 18 and France 12 tons. Of straw and packing paper the United States sent 476, Spain 178, Germany 18 and England and France together 7 tons. Germany sent 100,000 cubic feet of building lumber. Spain sent almost all the shoes used—21½ tons (Germany sent 10 tons). Railroad materials were taken mostly from Belgium—2,187 tons (Germany supplied only 120 and England 5 tons).—United States Consular Report.

The gold production of the world for 1893 was \$150,000,000; that of 1892 was \$138,860,000.

MALAYAN ARROW POISONS.

Last year Ralph Stockman contributed to *Pharm. Jour.* a short account of the physiological action of an arrow poison used by the natives of Perak. Since that time he has been enabled to work upon larger quantities, and in a recent contribution to that journal gives the results of more extended investigation.

"The poison is made by the natives from the root-bark of three trees, the extracts being either mixed or used singly to smear on the arrow-heads. By the natives the poisons are known as "Ipoh-aker," "aker-lampung," and "prual," respectively. I have examined the physiological action of alcoholic and watery extracts, made from the bark and wood of the trees from which the poisons are derived, and find that these all possess toxic effects.

Ipoh-aker.—This is obtained from a species of *strychnos*, as yet unidentified. My few previous experiments led me to conclude that the extract from the bark killed by an action on the heart similar to that of digitalis. Further experiments on rabbits confirmed these results, namely, that the animals died rapidly after subcutaneous administration of a large dose, from its effects on the heart, and that the motor nerves remained excitable to electric stimulation for some time after death. I find, however, that in addition there is a well marked curare-like action which is more easily observed in frogs than in rabbits. In the former animals the terminations of the motor nerves are readily seen to be either partially or completely paralyzed, in addition to the digitalis action on the heart.

Extracts made from the wood were very much less toxic than those from the bark. Large doses were required to cause death, and it took place slowly and gradually, and from paralysis of motor nerves in rabbits, not from cardiac paralysis. Both in rabbits and frogs, however, the effects on the heart were quite distinct.

The combined action on the heart and motor nerves is by no means a new observation in plants of the genus *strychnos*. As is well known, curare is obtained from *strychnos* species, and several observers in experimenting with curare have seen and described an action on the heart as well as on the motor nerves. In 1886, Bohm isolated two alkaloids from curare, which he named curine and curarine, and Tillie has shown that the former has a digitalis-like action on the heart, while it is the latter which paralyzed the motor nerves. It is therefore in the highest degree probable that ipoh-aker, derived from a species of *strychnos*, also contains two active principles having these different actions. The bark evidently contains more of the cardiac poison, in proportion to the nerve poison, than the wood does.

Aker-lampung.—This is also obtained from an unknown species of *strychnos*, but it does not seem to be very toxic; at least the specimen which I examined must either have contained very little of the active principles, or the latter may have become partially decomposed in making the extracts. From the roots sent me 40 grammes of bark was obtained, and this was thoroughly exhausted with rectified spirit; on evaporating the alcohol 1 gramme of dry extract remained. A half of this (20 grammes bark) dissolved in a little alcohol was given subcutaneously.

the heart was slowed and passed through certain phases as if poisoned by digitalis, ultimately stopping with the ventricle in extreme systole. In some cases the motor nerves were also completely paralyzed. So that here, also, we have most probable, as in curare and ipoh-aker, two distinct active principles, the one acting on the heart muscle, and the other on the terminations of motor nerves.

A watery extract from the wood of the root showed the same actions, although very large doses were necessary to cause death.

Prual.—The botanical source of this poison is unknown. I had only a very small quantity of the bark to work with, and made from it an alcoholic extract. When this was given subcutaneously to frogs in a little water, the muscles at the point of injection became almost immediately quite stiff, and there occurred a considerable subcutaneous extravasation of blood. On removing the skin the blood escaped and the muscles in the neighborhood were found to be white, dead, and non-responsive to electrical stimulation. The nerves and muscles elsewhere were found to be quite normal. When a very large dose was given the animal collapsed almost at once, and the heart stopped in diastole. In rabbits no general symptoms were observed, but at the point of subcutaneous injection there was always some extravasated blood and stiffness of the muscles. A watery extract from the wood gave similar results. Apparently its action as an arrow poison consists in disabement of the muscles where the animal is struck.

The mixture of all three substances is no doubt excellently adapted for use as an arrow poison. As I pointed out in my previous paper, its action is different from that of antiarin, or strychnine, or any arrow poison from the same district hitherto described."

Eight millions of the human race use coca. The plant grows in the hot, moist eastern valleys of the Andes, and is mostly cultivated in terrace gardens, often not more than eight or ten feet wide, and of which sometimes as many as 100 are placed one above the other on the mountain slope. The plant is from four to six feet high. It is raised from seed sown in December or January, at the beginning of the rainy season, which continues until April. In the following year the plants are transferred to specially prepared ground, and at the age of 18 months the first harvest, "quita calzon," is gathered. The plants continue to yield for about forty years, three or four crops being gathered each year. The largest crop is in March, after the rains; the smallest at the end of June. The leaves are called "matu" when green, and only acquire the name "coca" after drying, which is done in the sun with great care. The internal trade of coca in South America has always been very large; at the end of the eighteenth century its value in the Peruvian vicerealty was reckoned at over \$2,500,000. In South America it is generally considered that the coca leaf can be kept for five months, after which it loses its flavor.—*Chemist and Druggist*.

The correct medical name for the "grippo" is *Myxioletema*.

Warehouse, Chester, Conn.

THE CONNECTICUT WITCH HAZEL CO.

The Connecticut Witch Hazel Company is a Connecticut corporation organized in May, 1893, with its principal office at Chester, Ct., and a branch office at 132 Nassau street, New York. The plant of the company consists of three distilleries and one warehouse, situated in the towns of Chester, Haddam and Killingworth. The plant and warehouse of the company being only some three and a half hours' ride from New York. It is an easy and a pleasant task for one who is interested in witch hazel to make a trip of inspection to their properties by leaving on one of the special Boston trains, which make the run to New Haven without stop, the second stop being Saybrook Junction, where a change is made to the local train running up the valley road to Chester, some nine miles distant. Arriving at Chester, the first thing that will strike the eye of the visitor is the large warehouse near the depot, as shown by the illustration, a building 128 feet in length by 50 in width, with two Ls. for the use of the boiler and engine. This building, which is used entirely for the inspection, handling, storage and bottling of the company's goods, is well situated for freight facilities, having its own wharf on the Connecticut river, and shipping platforms extend from the building direct out to the railroad tracks.

This property was purchased to provide at some central point a system of checks in the manufacture of "Hazel Bloom," so that it would be impossible for any careless work or change of grade to be made in the product shipped under the company's brand. The product from the three distilleries is received at this warehouse. The company does its own trans-

portation, as a safeguard against practices similar to those sometimes alleged against certain milkmen who visit the town pump. As the witch hazel product is nothing more or less than a water distillate, it would be a comparatively easy matter, with proper arrangements, for the bulk of the goods to materially increase in transportation if they were allowed to go out of the company's hands.

The first care in the handling of the product is the cleansing and steaming of the barrels. Herein lies a great secret, as nine-tenths of the possible trouble with witch hazel product comes from the use of impure packages and careless work at the distilleries. To provide against any such possible trouble, the necessary number of barrels are prepared and set aside for the truckmen each day, and a special set of trucks is used for this purpose, which are taken to each one of the mills one day and filled and returned the next, the company never allowing any accumulations of packages at the distilleries.

Arriving at the warehouse, the barrels are hoisted to the third story, as shown in the illustration, and there received for inspection by the superintendent of this department. Each barrel is opened and samples taken of the product; it is then gauged, credited to the proper mill and the contents emptied into large filters and conveyed to one of three large receiving tanks by an ingenious arrangement of valves and rubber hose. The product is allowed to settle for twenty-four to thirty-six hours, according to the different capacities of the tanks. If destined for bulk packages, it is then drawn off to the filling tank on the first floor (illustration 3) and from there run into the barrels or half barrels for stock. Here a very im-

portant check is made, the superintendent noting the number of gallons, date, mill, run, etc., of the product as it goes into the tanks, each tank being allotted to the reception of extract from a certain mill, and the different products are never mixed. When it is barreled each package is first marked with a series of letters, which show the mill and the day of the month of distilling; the package is also numbered and gauged. This settles the identity of any one package forever, as these marks are never removed, and no other marks are ever permitted on the packages until they are shipped. The entering of all these records into the receiving book of the warehouse establishes a permanent and practical history of each item. The filling tank, as shown in illustration 1 is a rather novel apparatus, specially designed to give an absolute gauge and a considerable pressure so as to fill the packages quickly, and at the same time provide against any possible error in quantities expressed and to save the time which would necessarily be consumed by the older method of taking the gauge by the stick. The valves that connect with each one of the tanks on the second floor allow the engineer at will to use product from any one of them, independent of the others. These valves are automatic, and are released by a touch of the hand and close themselves when the zero mark at the top shows that the tank is full. Being some ten feet in height, the pressure is very considerable, and when released through the filling hose a barrel of forty-seven gallons can be filled in something less than a minute and a half. The moment that the flow is stopped the gauge tube shows exactly the gallons and fractions of a gallon that

have been put into the barrel. At this point the alcohol is added, and here the company has adopted a method to prevent any possibility of mistake in the way of putting the stated amount into each barrel. The alcohol is put into the package first, then the package filled up with the crude extract. As alcohol barrels vary all the way from one to two and a half gallons in the gross gauge, and as the company "alcohol" on the basis that all barrels would gauge at the minimum, the product generally overruns in percentage of alcohol, and never shows a less percentage than the standard. We have thus rapidly described the history of a barrel of crude extract arriving from the mill and going through the different stages of inspection, tankage, measuring and mixing, and finally the placing upon the package of the number, quantity and other marks of identity. The barrel then joins many of its predecessors in the large storage room (illustration 2), which, at the time, contained something over 550 barrels, representing in all over 25,000 gallons, valued at over \$12,000. Before leaving the warehouse we must go back to one of the largest and most important departments located on the second floor, viz.: the extensive and complete bottling room, with its appurtenances and apparatus used in the business. Illustration 3

shows the labeling and wrapping of the bottles, which are specially manufactured for the company by the Whitney Glass Works, of Philadelphia. They are first unpacked and washed in an ante-room, and are at that point placed in trays which contain a specified number of the different sizes. When the bottles are once cleaned and drained and placed in these trays they practically remain there until they have been filled, corked, labeled and wrapped and sent out to the packing room. It is this observance of details that enables the company to handle its large business and keep a constant check on all its employes, and in so small an item as these trays lies the secret of their never yet having a mistake made in the bottling-room, or, according to the records of the company, a claim made of any shortage in the packing of the thousands of bottles that pass through this department each week. All of the Hazel Bloom that is destined for the bottling department is taken from one of the tanks on the second floor and run through a purifier. If there is any secret process in the whole business it apparently lies in this one piece of apparatus. The chief engineer informed us that we could investigate and ask any questions that we pleased about any piece of property owned by the company except this purifier, and on

that point he would have nothing whatever to say. We have simply to record from observation that it probably takes eight hours for a barrel of the crude product to go through this piece of mechanism, and, although it is comparatively clear when it is put in, whatever process it is subjected to in this piece of apparatus, when it emerges it is as bright and sparkling as the alcohol itself, which is only a part of it. From the purifier it is put into special packages, which are attached by a simple hose and pressure bottle-filling apparatus fitted to a regular bottling sink such as is common to all establishments requiring bottling facilities. This has been reduced to so simple a system that one girl can easily fill and cork all of the bottles required for the daily use of this department, which practically averages over 1,000 per day. As noted before, the bottles are filled and corked without removing from the tray they were originally put in at the washing tank, and after filling and corking they are piled up, the quantity and size being stenciled on the end of each tray. The trays are of a size containing such quantities as are easily handled, and they are taken one by one by a girl who may be working on any particular size of bottle to her table, where the labels are put on, the tissue wrapper added, the bottle replaced in the tray, and it is then carried to the other side of the room and placed in a rack, where it remains until sent out to the shipping-room.

Another mechanical feature introduced by the company as a labor-saver is an overhead trolley railroad track (illustration 1), from which is suspended a combination chain block, by means of which a barrel of 45 pounds can be picked up at any point in the warehouse and transferred to another point with an expenditure of labor such as any strong boy can easily furnish. The shipping platform, from which all deliveries are made, is situated at the south end of the store-room. The company, not satisfied with being able to handle any amount of stock with a single pair of hands, found a way to save the handling of the packages between the warehouse and the railroad by building a continuous platform six feet wide from the side of the warehouse over onto the main tracks of the railroad, and arrangements were made so that a car can be loaded direct from the platform, or shipments delivered direct into a freight train by the means of special skids, etc.

We have noted briefly the facilities of this building in relation to the manufacturing part of the business, but in addition the company have all the accessories necessary to handle their business in the way of a large steam plant, Corliss engine, large steaming-room, sawdust and drying-room, with bins and mechanical appurtenances to deliver the sawdust to the packing-room, where all the bottled goods are packed in barrels and surrounded by sawdust, which the company has found the most practical way of shipping bottled goods without running the risk of breakage. The company also have their main offices on the first floor of the building, and the conveniences of the establishment are such that it has an easy working capacity of ten gross of bottles per day, and a storage capacity of 1,000 full packages and the same number of empty packages.

(1) Filling Tank.

Leaving the warehouse, a pleasant drive through the village of Chester brings us to the first, or Chester, mill, about two miles distant. This mill is one of the oldest in the country used in the manu-

requires considerable capital. The brush is all contracted for in November, December and January, and the brush bills are settled every Tuesday morning. From twenty to thirty persons are employed in

The mantle of secrecy which has been held up before the manufacture of this product is thrown aside by this company. They are perfectly willing to offer any of their customers or other reputable parties any explanations they may desire in regard to the manufacture of their goods, and, judging from the amount of business which they are handling after an existence of only a year as an organized company, it is quite safe to predict their future success in building up a large business in the sale and distribution of this product.

The company has adopted a trademark, "Hazel Bloom," for their standard product, protected by full letters patent granted in this country and on the continent, and under United States number 2531, they put up and manufacture only one standard grade of goods, which bears the name and title adopted by them. Wherever this brand is seen, it bears the guarantee of the company as to quality and percentage, and if by any possible circumstance there is ever a package of goods shipped or delivered by them that has passed the many barriers and checks devised to insure its quality, they are not only perfectly willing to replace it, but will thank any customer to report it, as by their system of registering, numbering and lettering each package it can be traced back and the careless employe detected. They are in the business to give an honest return for the money paid them, and with such principles for a guide and the facilities they have there is no question about their success.

The main offices of the company are at Chester, Ct., and the financial branch is located at 132 Nassau street, New York City. Messrs. Cushman Bros., of 78 Hudson street, New York, are the selling agents for New York City and vicinity, covering a circuit of forty miles. Mr. William S. Banker, of Albany, N. Y., holds the selling agency for the remainder of New York State. The Morley Drug Company, of Chicago, are the western

2. Storage Room.

facture of witch hazel extract, and is run by water-power. The internal arrangements of the mill comprise a full distilling equipment of five stills, steam boilers, condensing coils, brush cutters, etc. The capacity is fifteen barrels per day, and at the time of the visit there were over 100 tons of brush piled up alongside of the building and for quite a distance along the road, awaiting manufacture into crude extract.

Leaving the Chester mill, a five-mile drive over the Middletown turnpike and a short dive off into the hills from the main road brings us to the second, or the Killingworth, mill. This mill has a capacity of six barrels per day, and is completely equipped with a copper plant and the old form of distillation, known as the direct process, in which individual fires are used underneath each still, and old processes used instead of the more modern employment of steam.

Still another drive of about five miles across country brings us to the third, or Haddam, mill, situated in the heart of the brush country. This mill has a capacity of ten barrels per day, with a full complement of five stills, together with the same full detail of apparatus as described in the Chester mill, and using the modern steam process. It is impossible to describe in a brief article the many evidences of care and business ability shown in the management of the various details necessary for the successful handling of such an extensive business in the way of economy of labor and the carrying out of a perfect system. But there does not seem to be anything that has been forgotten to save a nickel in the proper transaction of the business, and there is certainly no evidence of any disposition to save money where, by its expenditure, the practical working of the business can be facilitated.

The business of the company necessarily

the various distilleries and warehouse, so that at the end of every month the product owned by the company represents quite an outlay of ready cash.

If anyone believes that the manufacture of witch hazel of a quality that can be depended upon, and in such quantities as will be necessary to supply the market, is child's play or a small matter, they will change their minds upon visiting the works of the company and seeing what a

(3) Labeling and Wrapping.

vast amount of labor and detail is necessary to manufacture the product which is so widely known in the United States and is rapidly becoming a household necessity in foreign countries.

agents. Negotiations are under way and nearly completed by which the company will be also ably represented in San Francisco, Washington, D. C., the City of Mexico and London, England.

TRADE NOTES.

Emmor H. Lee, drug broker, formerly of Columbia, S. C., has removed his family to Atlanta.

Lewis, Balfie & Co., Ltd., Shreveport, La., who were burned out recently, will resume business about May 1.

The Standard Carbonating & Bottling Co., incorporated, have begun operations at the corner of Pryor and Mitchell streets, Atlanta.

The registry of a label for "Clarke's Cherry Rye Phosphates with Pepsin" by Colburn, Birks & Co., Peoria, Ill., is noted in a late number of Mida's Criterion.

Glenn's Sulphur Soap is claimed to be the original sulphur soap, and it has been before the public long enough to have its reputation thoroughly established. It is advertised "For sale by all druggists," and that is where the public expects to find it.

When you want something in the way of a corn remedy do not forget the preparation manufactured by the U. S. Corn Killer Co., Buffalo, N. Y. Their motto is: No kill! No pay! They offer one dozen and a half for \$1.50 on the first trial order. Retail for 25 cents.

The druggist in all communities is considered the standard bearer of scientific achievements, the first to recognize meritorious production. This truth accounts for the 20,000 patrons of the Liquid Carbonic Acid Mfg. Co., of their perfected apparatus for charging soda and mineral waters.

The druggist who is looking for a box prescription scale, with all the latest improvements should not overlook the offer of Robert Stevenson & Co., Chicago, on page 8 of this issue. The Dearborn Box Prescription Scale and Dearborn Counter Scale are now offered at \$20 for both. See detailed description of these scales.

If there are any people in your neighborhood who ought to have invalid chairs, crutches, or any kind of mechanical appliance for the alleviation of suffering, you should send for the catalogue of R. Boerick & Co., 495 Wells street, Chicago, who manufacture apparatus of this kind, and make an effort to work up trade. It will pay you.

The necessity of text books upon pharmacy has always been recognized, and their value to the profession has always been duly credited; but it is only within late years that the necessity for books upon profitable side lines has been clearly recognized. Now that the soda water business is so strongly established in connection with that of pharmacy proper, the demand for something of this kind is quite clear, and it is to fill just such a demand that Saxe's New Guide has been written. It fulfills its mission by showing how to manufacture and dispense soda water in a manner which will attract trade and keep it. The profits on 100 glasses of soda water will pay for it, and the information it contains is yours for all time, and the investment of \$3 will pay dividends as long as you keep a soda fountain. It is published by the Saxe Guide Publishing Co., 409 Dearborn street, Chicago.

The Searle & Hereth Co., of 183 Canal street, Chicago, manufacture nearly everything in the way of standard pharmaceuticals, but their popular specialty is "Trificia." Interesting literature upon this preparation will be sent you if you desire it, and your physician can obtain samples free of charge upon application.

By ordering your prescription blanks in large lots of J. B. Burr & Co., Hartford, Conn., you are able to get them as low as 35 cents per thousand. It certainly pays to buy in large lots. If you desire anything in the way of office books, using carbon paper for duplicating correspondence, you should write this firm for prices.

Ordinary corks are perhaps good enough for ordinary purposes, but the Williamsburg Cork Co., Brooklyn, N. Y., believe that greater satisfaction will be obtained by making special corks for druggists. They therefore make that kind of corks, and a trial order for their goods will convince that these special goods are just what every druggist wants.

Commercial travelers who visit the drug and fancy goods trade will find an opportunity to make money by writing A. P. Preston, Portsmouth, N. H. "Preston of New Hampshire" has an exceptionally fine line of toilet articles, perfumes, etc., and a deaf and dumb man could sell his goods with the samples he furnishes. Write him for particulars.

Powers & Weightman, of Philadelphia, request that their friends when ordering their U. S. P. products to kindly specify which pharmacopoeia is meant, that of 1880 or 1890. In the absence of specific instructions they believe they are correct in sending "1890" preparations, but greatly prefer that orders be explicit on this point.

The Stopped Citrate Bottle with patent lightning stopper, lately introduced by the Saltsburg Bottle Works Co., Saltsburg, Pa., is sure to be a great favorite with the public, as by its use the bottle can be corked and uncorked at will without detriment to the medicinal properties of the preparation contained therein. The bottles cost but \$7.50 per gross.

Alfred Legoe & Co., Philadelphia, not only make several sizes of the Keystone Tablet Machines to meet all requirements, but they furnish any information desired in regard to mixing materials, formulas, etc., to their customers. When you think of purchasing a tablet machine investigate the Keystone.

Is the uniformly ornamental appearance of your shelf-ware becoming deteriorated by the shabby appearance of some of the labels upon your bottles? If so, Dr. R. R. Lansing, of Detroit, Mich., can help you out. His patent glassine labels are intended for wear, and he can reproduce any style of glass label that you desire. Send 8 cents for sample and see what they are like.

The ordinary cutter will have to bestir himself if he undersells you on the Beef, Wine and Iron which you buy of Henry K. Wampole & Co., of Philadelphia. He sells in bulk, barrel lots, at \$1.30 per gallon, and bottled in gross lots with your lithographed label at \$42 per gross. Samples will be sent you if you desire to assure yourself of the quality of Wampole's Beef, Wine and Iron.

Kinlool, the new antipyretic and analgesic, is now put up in one ounce vials in either powder or tablets, the latter being made of five grains each. In headache and neuralgic pains this preparation exerts a most pleasing influence relieving the pain without depressing the system. Send to the Kinlool Company, Cleveland, O., for free samples, and let your physicians test their merits.

As American agents for the well-known foreign firms Heine & Co., Leipzig, Lautier Fils, Grasse, George Lueders & Co., 218 Pearl street, New York, are in a position to furnish the drug trade with oils in which perfect confidence may be placed. When ordering Oil Mustard, synthetic, specify "Heine & Co.," and when Olive and Almond oils are wanted specify "Lautier Fils."

The spring housecleaning season will soon be here and every druggist should be prepared to furnish his customers with Gypsigne, the wall finish, manufactured by the Diamond Wall Finish Co., Grand Rapids, Mich. Write them for particulars, color cards and a copy of the "Gypsigne Advocate." This little paper is bright and attractive, sells Gypsigne, and advertises the dealer who handles it.

Henry W. Stecher, of Cleveland, O., argues that other things being equal, the largest sheet of sticky fly paper will catch the most flies and he asks the drug trade to carefully consider this point when looking into the merits of "Stick-Em." The public is very thoroughly posted on this undoubted advantage and will show its appreciation by favoring the large sheet.

Remarks about the weather are always in order, and the weather is such that remarks concerning the packing away of winter clothing will soon be apropos and the public will soon be heard calling for naphthaline. Schoellkopf, Hartford & MacLagan, 3 Cedar street, New York, are headquarters for this product in flake, crystals and balls. Large buyers should send to them for special quotations.

WORLD'S FAIR PICTURES.

Later parts of the Michigan Central's World's Fair Portfolio fully justify the claim made upon the publication of the first number, that it was the best, the finest and the most artistic of popular publications on the White City.

Each part contains sixteen (16) large plates and is sold for only ten cents. If you haven't seen it, the nearest Michigan Central ticket agent will show it to you, or you can write to O. W. Ruggles, G. P. and T. Agent, Chicago.

A LAWYER'S TESTIMONY.

Mr. John W. Lyon, a prominent lawyer at Port Jervis, N. Y., writes: "With Quinn's Ointment I have reduced a lump or bone difficulty on forward leg of my valuable road horse and am much pleased. It had been previously treated without success." For curbs, splints, spavins, windpuffs and bunches use this wonderful remedy. Quinn's Ointment is indorsed by the leading breeders from Maine to California. It will pay to carry it in stock, and if you desire advertising or will send the names of ten or twelve of your customers, write to Messrs. W. B. Eddy & Co., Whitehall, N. Y., they will forward them, without charge, trial packages.

The Herf & Fretlich Chemical Co., of St. Louis, are now in a position to supply Sulphite Soda, Granular, Crystals and Dried Powdered, in large quantities and at low prices. Their quality is excellent and they solicit inquiries from large buyers.

He who attacks old methods may be called an iconoclast or other hard names, but progress and perfection has been the motto of the Liquid Carbonic Acid Mfg. Co., Chicago, Pittsburg and St. Louis, and they now feel that they have planted their banner on the very pinnacle of achievement in their line. Write for catalogue and prices.

Garwood's Perfumes have for many years been regarded with much favor by leading retail druggists. Their two new odors, "Gardenia" and "Sweet Scented Shrub" seem to excel their usual high standard, judging at least from the number of orders the firm are booking. Perhaps the unusually liberal offer they make as an introduction may have something to do with it. Look for their announcement in the next issue.

One way to counteract the influence of the physician's supply houses is for the pharmacist to make an effort to interest the physician in the preparations and specialties of a house which does business through regular channels. This is the position taken by The Tilden Co., of New Lebanon, N. Y., and they are always ready to co-operate with the pharmacist in bringing their goods, through him, to the notice of the medical profession.

"Book of Soda Water Syrups" is the title of a 68-page book just issued by James W. Tufts, 33 Bowker St., Boston. Mr. Tufts wants every druggist who has a soda fountain to have a copy of this neat little book, and if excellence of the material contained in it is any indication, a great many will want it. It is full of formulas and good advice as to the proper manner of conducting a soda water business to make it pay.

The statement that complaint and loss can be avoided by handling "Tanglefoot" is one which does not apply to flies, but to the dealer who handles this popular sticky fly paper. Tanglefoot is so carefully made that its manufacturers claim that it will retain its good qualities and be true to its name under the range of climatic conditions which prevail from Manitoba to the equator. See prices for 1894 in advertisement in this issue.

The Iron Clad Manufacturing Co., of 22 Cliff street, New York, claim that not a single case is on record where one of their patent Truss-bottom riveted Steel Fountains has exploded, and they present some very good arguments why their peculiar processes of construction have made this record possible. If you are interested in soda water matters you should investigate the steel fountains manufactured by this firm.

The Welch Grape Juice Co., of Vine-land, N. J., have exhibited at thirteen food exhibitions during this season, and they estimate that they have given away in sample tastes over 2,000 quarts of their grape juice. That this pays them is evidenced by the fact that their spring trade is far in advance of that of last year, and their order for glassware for use during the coming season has just been placed for over one thousand gross of bottles.

Have you taken advantage of the offer which the Acme Tablet Triturate Works, 96-98 Maiden Lane, New York, are making to introduce their Little Liver Tablets? They will furnish you all you can sell within thirty days free of cost if you will order and pay for a like amount within the following thirty days. These tablets cost 84 cents per dozen, \$8.64 per gross; \$5 in five-gross lots. Retail for 10 cents.

The retail druggists have discovered that there is money in handling bath mitts, flesh mitts, slippers, robes and Turkish towels and the Star and Crescent Mills Co., of Philadelphia, report a growing demand for this kind of goods manufactured by them. They are now making arrangements to place their goods in the hands of the regular jobbing trade, and the retailers will soon be able to have their wants supplied through this channel.

A pill cabinet is an article of furniture which every druggist has a use for, and when the same can be procured free of charge with purchases of goods in every day demand, the opportunity should not be neglected. The Upjohn Pill & Granule Co., of Kalamazoo, Mich., offer two sizes of such cabinets with orders for assortments of their goods amounting to \$50 and \$100 respectively. Write them for their latest pill list, and ask about these cabinets.

Owing to the great increase in their soda water business the Silurian Mineral Spring Co., of Waukesha, Wis., have made arrangements to charge fountains at their Chicago warehouse. This will effect a great saving in time and will enable them to give much better satisfaction to their customers in Chicago and vicinity. They have a complete apparatus for charging fountains at their Chicago warehouse, and will ship the water from Waukesha in block tin-lined barrels.

"Something worth reading" is what everybody is after, and as the catalogue of the Tyer Rubber Co., Andover, Mass., comes within this category every druggist should have it. Send for it and see what this company has to offer in the way of syringes, breast pumps, atomizers, water bottles, rubber gloves, etc. Druggists ought to be able to do something with the Tyrian plant sprinklers this summer, and should investigate the Tyrian Sanitary Cover as a seller.

The accompanying illustration represents the patented Automatic Alarm Box used by the J. Hungerford Smith Co., of Rochester, N. Y., to pack their "True Fruit" Pepsin & Kof-Kure chewing gums. It is a fancy counter box, lithographed in attractive colors, having a glass cover which operates the striking mechanism, giving a single stroke on the bell every time the cover is raised. The box attracts attention, helps sell the gum and besides prevents pilfering. Each box contains sixty

5-cent packages. Write for prices.

The "U. S." brand Empty Capsules are offered to the trade as standard articles at standard prices, and anyone desiring to investigate the claims of the manufacturers regarding the uniformity in size, cut and finish of these goods will have samples furnished for comparison with other brands. Address U. S. Capsule Co., Detroit, Mich.

There are many conditions of disease which a quickly assimilable, agreeable and comprehensive nutriment is required, and there is none, perhaps, which so fully approaches these requirements as Panopepton, the bread and beef peptone manufactured by Fairchild Brothers & Foster, New York. It is meeting with great approval from the medical profession, and is a preparation which will pay the druggist for the space it occupies upon his shelves.

Have you received the latest revised and enlarged prices current of the Wm. S. Merrell Chemical Co., Cincinnati, O.? If not it will be sent you upon application. The products of this firm cover such a wide scope that a price list issued by them becomes a valuable index both of materia medica and prices. See their advertisements in this issue, and note the list of tablet triturates and compressed tablets upon which you can have a good trade the coming season if you will add them to your stock.

A. H. Wlitz, of 913 Cherry street, Philadelphia, manufactures so many things which every druggist needs that his catalogue should be in the hands of every member of the trade. He makes a specialty of bottle stoppers for corks and screw-neck liquid and powder bottles, collapsible tubes for ointments, pastes, perfumes, etc., pill machines, moulds for suppositories, bougies, camphor ice, cosmetic, etc., and makes a general line of metal goods for the drug trade.

All druggists who handle trusses, elastic stockings, etc., should have the catalogue of George R. Fuller, Rochester, N. Y., and compare his prices with those of other manufacturers. Those of the trade who have never given the subject much attention will also find upon examination of this catalogue that they have only to take advantage of opportunities which exist in every neighborhood to work up a profitable trade in crutches, artificial limbs, etc. It only requires a little effort to do this and it pays well.

The New York office of the Deane Plaster Co., of Yonkers, N. Y., has been removed from 42 Dey street, to 100 Fulton street.

You will probably have to pay "trust" prices for the alcohol which you must use in making bay rum, but there is no use in paying fancy prices on extract of Bay Laurel when you can purchase a pound for \$2 of Henry Thayer & Co., Cambridgeport, Mass., and make eight gallons of superior bay rum with it. See list of jobbers in this issue, who keep it in stock.

Besides furnishing goods of unquestioned high quality, W. H. Bowdler & Co., of Boston, put up their pure white and pure refined beeswax in an attractive manner and in parcels to suit the retail trade. Many dealers will consult their own interests by noting the various packages in which these goods are put up as shown by the firm's advertisement in this issue, and will save money by ordering original packages. The leading jobbers handle the W. H. B. brands of waxes.

We are Chicago agents for "True Fruit" Fountain Syrups, manufactured by the J. Hungerford Smith Co., of Rochester, N. Y., from the finest selected fruits, by a new cold process of their own. They are concentrated, rich, heavy, triple strength syrups, far superior to fruit juices, retaining the true flavor and bouquet of the fruit. The most convenient. Dilute with two to four parts rock candy syrup and they are ready for use.

D. B. SCULLY SYRUP CO.,
49-51 River st., Chicago.

Wm. R. Warner & Co., Philadelphia, are always to the front with pharmaceutical applications of the latest medical discoveries. Pharmacists will do well, therefore, to keep in touch with this firm in order to supply the wants of the medical profession promptly and satisfactorily. Among the articles now in great demand are their Elixir Salicylic Compound, Liquor Pancreapsin, Pills Sumbul Aperient, and Compound, Pill Arthrosia, Pill Cascara Cathartic, Pill Chalybeate Compound, and Bromo Soda.

Red Orange Juice, made with different parts of the sweet, bitter and mandarin oranges, apportioned and blended with the juice so as to give a perfect representation of the flavor of the red orange of Malta, is one of the specialties of the season with Smith & Painter, Wilmington, Del., and is bound to be a favorite. Every druggist owning a soda fountain should send to this firm for their book on "Natural Fruit Juices." It is full of recipes for fountain syrups, mineral waters, creams, etc. It only costs the trouble of applying for it.

The economy of buying certain goods in large lots is shown very strikingly in the offer of the E. N. Rowell Co., Batavia, N. Y., in their advertisement in this issue. It shows that a manufacturer can afford to make a big reduction in prices on such lots and the buyer reaps the advantage. Bronze pill boxes with your lithographed label on them at 70 cents per gross, or 60 cents per gross with printed label, in 10-gross lots is certainly a bargain. The samples which they send will convince you that the goods are worth the money.

Of all the new drinks brought to public notice of late there is none perhaps more popular than Silurian Wild Cherry Phosphate. It is tonic and antiseptic in its effects and a decided nerve bracer. This popular drink is now put up in the shape of a syrup for serving at the soda fountain the same as any other soda water drink. It is quite sure to share in the favor which is extended to all Silurian products and any druggist having a soda fountain who will write to the Silurian Mineral Spring Co., Waukesha, Wis., will have a sample sent free of charge.

The uniform high character of the products of the New York Quinine & Chemical Works has caused them to occupy an enviable position in the esteem of the medical profession and it naturally follows that the pharmacist shares in this opinion. The dispenser who looks for satisfactory results will do well to specify "N. Y. Q." when he desires anything in the way of quinine, morphine and their salts, santolin, aloin, cocaine and acetanilid.

Webber-Pepsin, S. & D., has an advantage which is easily recognized in being just twice as active as the minimum requirement of the U. S. P. 1890. There are many physicians who frequently desire to prescribe a pepsin of high power, and to such the Webber is a favorite brand. At the same time, if one is desired which meets the U. S. P. requirement in every detail, it is only necessary to dilute this pepsin with sugar of milk. That Webber pepsin thus prepared is economical is shown by the figures given in the advertisement in this issue of Sharp & Dohme.

Dodge & O'Connell's factory price list for April contains a full page photo-print of a native sketch sent them by a correspondent in China, illustrating the primitive methods employed by the Chinese in producing Oil Cassia. As the author of this unique production uses the English language in a rather original and free-handed manner his sketch has been dubbed "The manufacture of Oil Cassia," according to "Ah Sin," and the artistic character of the work convinces us more than ever that the "heathen Chinese is peculiar."

Almost any kind of a sticky composition will catch a fly, but the great point in choosing a sticky fly paper is to get one which is not too adhesive in cool weather and which does not allow the composition to flow too readily in hot weather. The "Champion," manufactured by E. F. Baker, Chicago, is claimed to meet all these requirements and is made of a parchment paper which is noted for its adhesive and non-drying qualities. In looking for a paper that will please your customers, let the Champion enter into your calculations.

Quality and other things being equal, the best line of paints for a dealer to handle is the one which is easiest to sell. As with everything else, advertising is quite an important factor in the selling of paint, and this is one of the reasons why it pays to handle goods manufactured by John Lucas & Co., Philadelphia and Chicago. Their unique color cards help people to select paint by showing them harmonious color combinations. Write them for samples of their color cards and dealer's discount.

"Denarco" and "To-bak-ure" are two remedies for the cure of the opium and tobacco habits respectively, which the H. W. Comstock Remedy Co., of Lafayette, Ind., have been quite successful in bringing to the favorable notice of the public. They are handled through the drug trade and those not posted upon the remarkable results which are being achieved through the use of these remedies, will be supplied with literature upon application. Write for prices.

W. H. Schieffelin & Co., New York, handle everything needed in the way of soda fountain requisites, and their advertisement in this issue names some prices which should not escape the attention of careful buyers. Their fruit juices are economical, as portions not used will keep perfectly, and but one part of juice is required to seven to ten parts of syrup. Large buyers should obtain their prices on bulk and gross lots, and all interested in the soda water business should send for this firm's descriptive list of the requisites, which will be mailed upon application.

The United States Printing Co., of Cincinnati, have recently issued a little book entitled "Card Games, 1894," containing the rules governing popular games at cards, embracing the very latest controlling decisions. For instance, "Whist," as revised by the last American Whist Congress, held at Chicago, June, 1893, is illustrated in detail, and the decisions on every point in the game are clearly set forth under the highest authority. Single copies sell for 25 cents, and druggists who handle playing cards should write for trade prices, as the book is one which the public wants.

There are many social occasions upon which the use of wax tapers becomes the proper thing and the druggist might as well let his light or tapers so shine that the public will know where to purchase them. The famous Haledon brand manufactured by Theodor Leonhard, Paterson, N. J., give good satisfaction and may be profitably added to the dealer's stock. The "T. L." and "Diamond L" brands of beeswax, also manufactured by Mr. Leonhard, are also satisfactory sellers and their qualities can be judged by the sample cakes which will be sent free upon application.

IMPORTANT.

Dealers will please take notice that R. E. Mills is no longer connected with this company. Pay no money, or give orders to anyone who does not show written authority from us.

LETTUCE CREAM COMPANY,
114 Fifth ave., New York City.

THE PLACE TO DINE IN NEW YORK CITY.

Business men visiting New York City are beginning to find out that one of the cosiest places to get a good dinner, with everything of the best, is the old restaurant, formerly Heckman's, now called the "Century," at No. 122 William street, in the center of the drug district, which has changed hands and is now run in first-class style by one of the best caterers in the city. There has been a restaurant in this building (the oldest in the city) as far back as the memory of the oldest inhabitant can run. Many of the leading business men, who are particular regarding their meals, may be seen regularly at this old hostelry.

What are you doing to carry out the ideas of the compilers of the U. S. P. 1890, regarding the employment of metric weights and measures? If it is simply a question of expense for the necessary appliances you should read the advertisement in this issue of Gilpin, Langdon & Co., Baltimore. They offer a set of metric weights and graduated measures with some goods which every druggist wants and must have. As the goods are sold at list prices the question of expense for the weights and measures is effectually settled. Write this firm for their price list and formulae; both are interesting.

Dealers who have calls for a rheumatic remedy should write to the Yellow Pine Extract Co., Albion, Pa., for advertising matter, which includes blanks for names of sufferers from rheumatism, whose trade they will work up for dealers, by mailing a descriptive letter, and circulars, with retailer's name as agent for their specialty. Yellow Pine Compound is claimed to be a perfect and permanent cure for any form of rheumatism, and one bottle sold creates a market for the remedy.

Goods sell at \$2.00 per bottle. For rates see their advertisement on another page.

Any druggist who has the Birney Catarrhal Powder in stock or will advise the manufacturers that he has ordered it will receive the co-operation of the latter in effecting its sale. By sending in 50 to 100 names of customers a free sample of the powder is mailed direct to the parties so designated with the compliments of the druggist furnishing the names. Every druggist should send his name and address to the Birney Catarrhal Powder Co., Masonic Temple, Chicago, and receive free a sample bottle of the powder and the beautiful picture "In Suspense."

Among the Nichols' preparations manufactured by Billings, Clapp & Co., Boston, that known as "Phosphoric" stands deservedly high with the medical profession. It is a phosphorized emulsion of pure cod liver oil, combined with the hypophosphites of lime and soda. Each fluid ounce contains one twenty-fifth of a grain of unoxidized phosphorus and eight grains each of the hypophosphites mentioned. This combination is claimed to furnish the best possible vehicle for the administration of phosphorus and one which is most effective in the presentation of cod liver oil in an elegant and palatable manner.

A recent United States consular report from Chemnitz, Germany, says that the Germans act upon the principle that a poor article in an attractive box is more easy to sell than a good article in an indifferent box. This theory of doing business is somewhat along the same lines as that advocated by Jesse Jones & Co., Philadelphia, in their advertisement in this issue. They insist that every article worth having should go to the public in a suitable container, and it is in the matter of containers, such as the "J. J." boxes that they have some particulars which will interest every druggist who will ask for them.

PLAYING CARDS.

You can obtain a pack of best quality playing cards by sending fifteen cents in postage to P. S. Eustis, Gen'l Pass. Agt., C. B. & Q. R. R., Chicago, Ill.

There is no trouble in selling Cushman's Mental Inhaler, for all you have to do is to let your sneezing, snuffing and coughing customers try one of them and the first inhalation usually settles the question in favor of the druggist who has them for sale. Write H. D. Cushman, Three Rivers, Mich., for information relative to his latest advertising offer.

Messrs. John L. Whiting & Son Co., brush manufacturers, of Boston, Mass., inform us that they have been advised by the committee on awards at the World's Columbian Exposition, at Chicago, of the following awards on their goods: "For valuable improvements in the manner of holding the bristles, differing entirely from that of other manufacturers, thereby increasing the length of the bristles for use, at the same time adding materially to the durability of the brushes. For the high grade of material used in their manufacture. For excellent workmanship and finish, and for the large display of paint, wall, varnish, whitewash, kalsomine, lather and artists' brushes."

A great statesman of our country in speaking of the resumption of speculations said that the proper way to resume was to resume. This plan is somewhat similar to that advocated by the D. B. Scully Syrup Co., 49 River street, Chicago, in the manufacture of Rock Candy Syrup. They say the proper way to make it is to make it of Rock Candy, a very natural, simple and easy operation and one by which the resulting product is of a definite nature and of assured purity. The approaching soda water season will naturally cause some interest to be taken in syrups, and the dealer should obtain the prices of the Scully Syrup Co. with a view of determining where to buy the best for the least money.

Dr. F. von Heyden's special Bismuth preparations are suited for many conditions where the therapeutic effects of the phenols and bismuth are desired. Phenol and Betanaphthol-Bismuth have been found of great service in all gastric diseases. Tribromphenol-Bismuth has been recommended by Hueppe as a specific against Asiatic cholera. Pyrogallol-Bismuth has the advantage of resisting the action of acids, while it dissolves in alkaline liquids, the intestinal juices more especially. Its use is indicated in the treatment of wounds, ulcers, lupus, etc. Full information regarding these preparations can be obtained through Schering & Glatz, sole agents, 55 Maiden Lane, New York.

ANNOUNCEMENT TO THE TRADE.

We desire to announce that the manufacture of Dr. Knorr's Antipyrine in the fine granular form in which it is now supplied to the trade admits of a production of a purer and more reliable article than that formerly supplied. In Europe, where it has been thus furnished for a considerable time, the medical profession has observed better therapeutic effects from its employment than those which have resulted from its use in its finely powdered form. In the future, therefore, Antipyrine will be manufactured and sold in this fine granular condition only.

SCHULZE-BERGE & KOEHL,
Sole Licensees for the United States,
No. 78 Murray street, New York.

Although the representation of the faded mermaid emerging from the briny deep to obtain a glass of Bowker's popular beverages is somewhat fanciful, yet this action of the representative of the highest social circles of the kingdom of Neptune finds a counterpart in the members of our own social world, whose discriminating taste leads to the same demand. Bowker's Birch Beer, Root Beer, Hitter Beer, Ginger Ale and fruit flavors have been, are now, and always will be favorites, and the dealer who dispenses these will please both himself and the public. Send to Dr. H. L. Bowker & Co., 26 Franklin street, Boston, for their large catalogue.

HAVE YOU SEEN IT? Eastern Star Perfume.

The latest success in the line of popular odors made by Foote & Jenks. It is very delicate and delightfully fragrant, yet its endurance and lasting properties when applied to the handkerchief or clothing is perfectly wonderful.

It is pre-eminently a favorite with ladies, and you know the ladies use most of the perfume. Most druggists have some lady customers who are members of the order of the "Eastern Star" in whose honor this odor was named. Most gentlemen are fond of perfume—also of ladies—and take very kindly to the "Eastern Star." Order a bottle of your jobber, or send to Foote & Jenks for sample and price list.

Trade tributary to New York City can be supplied by McKesson & Robbins.

The above cut represents a new style of tin boxes lately put upon the market by Joseph G. Tait's Sons, Philadelphia, Pa. They are of convenient size to be carried in the vest pocket and hold one dozen of either quinine or compound cathartic pills. They are made of bronzed tin with lithographed labels of olive green, and are lacquered inside. They are put up in pasteboard boxes of one-half gross each, and as they are very handsome and attractive they will undoubtedly be received with favor by the trade. Specify Joseph G. Tait's Sons, when ordering of your jobber.

The season will soon be here when the public will take renewed interest in the subject of disease germs in articles of food, and it is safe to say that our scientific men who are engaged in the investigation of such subjects will not relax their efforts, but will more than ever endeavor to awaken the public interest in such matters. This is the time, therefore, when the druggist should locate his own position upon the subject and one means of doing this is to become posted as to the workings and merits of Arnold's Steam Sterilizers, manufactured by Wilmot Castle & Co., Rochester, N. Y. They will send full particulars upon application, and people will soon be looking for articles of this kind.

The advertisement of Frederick Stearns & Co., Detroit, upon page three of this issue will be a pleasant reminder to many of the drug trade of a great event which formed almost the sole topic of conversation about one year ago. The World's Columbian Exposition, with its glory and successes, is now a thing of the past except as it lives in the memories of those who visited it, and upon the pages of history. As regards the former there is sure to be in the mind of every druggist a pleasant remembrance of the handsome exhibit of this firm's products at Chicago, and in the way of history F. Stearns & Co. can certainly be proud of the fact that the record will always show that fifteen awards were given them upon their products, number one being for "the extent and importance of the exhibit, and general skill in their productions."

An investment of a little over two cents may bring in big returns if it is placed in the proper manner. A promising opportunity of this sort is in sending to James W. Tufts, Boston, for his new catalogue showing latest designs in soda fountains, bottling apparatus, fruit juices and extracts. The small apparatus entirely composed of Mexican onyx which Tufts builds to order, are gems of beauty and artistic excellence. They should be investigated. You should also send for a little book entitled "How to Make a Soda Fountain Pay," being a reprint of an article on "Side Lines" by D. S. Carraway, originally appearing in Merck's Report. It contains many valuable hints for the soda dispenser, and will be of service to every druggist.

ment is now undoubtedly the very best instrument of its class. It is sold complete with a 3-lens magnifier at \$1.75, post free.

This firm also makes a special feature of its business, the manufacture of suitable collecting apparatus for plants, including their new plant-press, which is light, neat and very convenient.

Office of Board of Health.

Waukesha, Wis., Jan. 25, 1894.

White Rock Mineral Spring Co.:

Gentlemen—It affords me great pleasure to be able to recommend your White Rock Ozonate Lithia Water, knowing as I do that every quart contains seven grains of Ozonate Lithia. In the treatment of diseases of the urinary organs, especially Bright's disease, I know of no other water its equal. This is my experience in my own private practice; hence I feel confident in making the above statement. Physicians need not hesitate in making this a prescription, as they are dealing with a known quantity and will get positive results. Respectfully,

R. M. WIGGINTON, M. D.,
Health Physician.

"Many men of many minds." Colburn, Birks & Co., of Peoria, Ill., say that all men are, however, of the same mind when the merits of Clarke's Pure Rye Whiskey are involved. They all know that it is the purest whiskey now in the market. It is a pure whiskey because nothing but the best selected, healthy, new rye that can be bought is used in its manufacture, only a small proportion of barley malt being used (20 per cent), just enough to convert the starch into grape-sugar. The greatest care is used in the distillation so that all injurious foreign elements are entirely eliminated. The success of Clarke's Pure Rye Whiskey has been phenomenal, and credit is due to the firm of Colburn, Birks & Co., the sole distributors, for the judicious and energetic methods they have used in introducing this elegant whiskey.

Although no druggist may have tried the experiment of placing two kinds of tumblers before his soda water patrons, one of thick glass and ungainly aspect, conveying the impression that they were intended for rough and awkward people, and another of thin glass and symmetrical appearance, there is no doubt as to which kind preference would be shown. This probable choice on the part of the public shows that some judgment should be exercised in purchasing such goods, and the advertisement in this issue of Whitall, Tatum & Co., Philadelphia, shows a very complete line of the same, with prices which should claim the attention of every man who sells soda or mineral waters. In addition to the styles shown this firm manufactures a number of special styles, and will send descriptions and prices upon application.

Queen & Co., whose advertisement of pocket magnifying glasses appears upon another page, desire us to call attention to the fact that they have just made several improvements in the construction of the already popular Gray Botanical Microscope, which is a very compact, convenient and low-priced microscope for the dissection of flowers. The instru-

There is soda water and soda water. Who has not tasted different kinds dispensed from the same kind of apparatus and from apparently the same formula? Of course there is a great deal depending upon the skill of the dispenser, but there is also as much, if not more, depending upon the quality of the material he uses. The Beach & Clarridge Co., of Boston, have taken advantage of this latter fact to put upon the market a line of soda water requisites for use by the dealer who dispenses the kind of soda water that the public likes. They have been successful in their efforts too, and will aid every druggist in dispensing trade-drawing and trade-retaining beverages who will send for their catalogue.

Very few druggists have any unoccupied space in their stores, in fact the opposite state of affairs most often exists—that of several articles struggling for the same space, and it then becomes a serious question, that of arranging stock to the best advantage both for convenience in handling and display. One of the means to this end is the employment of the "Silent Salesman," made by John Phillips & Co., Detroit, Mich. This is a show case in which the space usually occupied by the counter is utilized for the display of goods and it is this feature allowing close inspection of the goods contained therein that gives it its name. Druggists will find this combination of counter and show case very convenient for cigars and the display of toilet articles and drug sundries. Send for prices on the "Silent Salesman."

The famous Malthusian theory regarding population and subsistence has always been a bone of contention between the ever-warring political economists, and now the Cudahy Pharmaceutical Co. have entered the lists against the noted English philosopher. It is somewhat astonishing when we consider the fact that science is now able to do such surprising things in the economy of food products, among which may be enumerated the manufacture of beef extracts, and the utilization of what used to be considered as waste products in contributing to our food supply. In fact, science is not only finding new sources of food supply, but actually furnishes pepsin to further increase our digestive capacity. Send to the Cudahy Pharmaceutical Co., South Omaha, Neb., for their booklet, "From Ranch to Table," and note the discussion "Starvation and Science."

We learn that the famous house of Ed. Pinaud, of Paris, has again been honored; and this time it is no less a distinction than the bestowing by the French government on Mr. Victor Klotz, the head of the house of Ed. Pinaud, the title of Chevalier de la Legion D'Honneur. This great mark of governmental favor was conferred on Mr. Klotz for the grand exhibit at the Chicago Exposition, and for the superiority of the goods.

We extend to Mr. Klotz our hearty congratulations, as the honor is not an empty one, for the recipient of the Order of the Legion D'Honneur from the French Republic must have rendered great services in advancing either its manufactures or arts, or for some other meritorious achievements; and we have no doubt that the great house of Ed. Pinaud will now become more famous and more widely known than ever.

Tollet paper is now a staple product. Its sale is increasing every day and there is no prospect of a diminution in the demand for it. It is in staple articles like this that competition is always a factor, and the dealer who desires to hold his trade must be on the lookout for opportunities to buy in the cheapest market. The A. P. W. Paper Co., of Albany, N. Y., are now selling their popular brands of paper, so that the druggist can retail it at prices which he formerly paid for it. Send for their new catalogue and reduced price list, remembering that the demand for tollet paper is on the increase.

Of all the known processes for purifying water that of evaporating and condensing is considered the most effectual, as is evidenced by the explicit directions of the United States Pharmacopoeia. These directions, however, call for a suitable apparatus, and the question of the selection of such is one which calls for some judgment on the part of the druggist. The use of distilled water is an absolute necessity for the pharmacist, and an apparatus which will furnish this product quickly, safely and economically is the one which he should purchase. The illustration shown above represents the Hygeia Water Apparatus invented and manufactured by the Jas. Curran Mfg. Co., 512-514 West 26th street, New York. An experience extending over thirty years in the manufacture of stills of this character has enabled this firm to place upon the market an apparatus which meets every requirement. The advance of sanitary science has naturally had an awakening effect upon the common people, who are beginning to be as careful in selecting the water they drink as in the food they eat. There is nothing to prevent the retail druggist from filling this demand which is now beginning to show itself, and furnish his customers with pure Hygeia water for table use, etc. Among those using and commending the Curran stills are Fraser, the 5th avenue chemist, New York, and the Army Medical School. Write for prices and the little blue book "How to Avoid Drinking Impure Water."

Other things being equal, the only reason for investing money in an attractive soda fountain is because it pleases the public. It is not strictly necessary as good soda water can be made with the simplest contrivances, but it will not do to go against public opinion in such matters. Every druggist knows that customers prefer the elegant elixir to the muddy looking mixture, and would rather receive the elegantly cartoned package than the slovenly wrapped bundle, and he knows it pays to please the public in such matters. It is the same way with soda fountains. The Low Art Tlle Co., 952 Broadway, Chelsea, Mass., have been preaching this sound doctrine for years and have been practicing what they preach by making goods which illustrate the idea quite forcibly. They show the druggist how he can please the artistic sense of his patrons and thus stimulate the appetite for the great summer beverage. Send for their catalogue, which shows illustrations of their fountains printed in colors, and when the time for buying comes get their prices.

No one who knows that most eloquent of after-dinner orators, Dr. Channcey M. Depew, has ever had the slightest doubt as to the high and lofty patriotism that has always animated him. Dr. Depew is an American, and however pleasantly he may speak to the foreign brother over the cigars after dinner, he has always been a sturdy supporter of old President Monroe's doctrine that the British Lion should keep his paws off Manhattan Island, Delmonico's and the Vanderbilt lines. In addressing the G. A. R., Dr. Depew has even been known to become eloquent on this subject, and even to gently and in polished metaphor rotate the caudal appendage of that same lion.

And yet Dr. Depew is too brainy a man to blind himself to the signs of the times. Force he does not fear, as he knows that the country still has its new navy to protect it. So he snaps his fingers at the red-coated Tommy Atkins; but he soon becomes apprehensive when he sees how peaceful things seemingly are. It is in the guise of peace that Dr. Depew most fears the insular lion. He distrusts the "Greeks bearing gifts," for he sees the invader. This is how the doctor expressed himself on the subject at a recent dinner at Delmonico's:

"Precisely what we are to do with the English invasion I do not know. We stood them off pretty well in the wars of the revolution and 1812, but now they have bought our heroines. They have captured our patent medicines and our factories, and it seems as if we are to be fed, clothed and killed by Englishmen."

In referring to the buying off of the American heroine Dr. Depew knew whereof he spoke, and that he knew and bore no malice was evidenced by his closing words: "But we welcome them. We welcome genius from anywhere." Dr. Depew knew that it was the goods of the Crown Perfumery Company, of London, that had taken the American woman by storm, and he knew that there was no regaining her. That he did not denounce the invader might have been due to the fact that he had himself a dash of their famous Crab Apple Blossoms on his own immaculate silk handkerchief at the time he spoke.

Flies are not confined to tropical and temperate climates, but abound in the arctic regions. In fact, wherever man is, there also is the fly.

The precise antiquity of the fly is unknown, but that it was identified with the early history of the earth is certain, as numerous fossils of it have been discovered, and it is frequently found in amber and other fossil kums.

Besides the common house-fly, the best known are the "Zimb" fly of Africa, which effectually prevents the exploration of vast sections of that country, the Sand fly of Egypt, which attacks the eyes of travelers; the Crane fly (Daddy Long Legs), the Grass Eater; the Hessian fly, destroyer of wheat and other crops, the Bot fly, which attacks domestic animals, but the universal plague is the house fly, which, taken all in all, is perhaps the chief of domestic pests so far as the insect tribe is concerned. Not only does it cause such petty inconveniences as spoiling our food and tickling exposed portions of our anatomy, but causes are on record of their actually causing death. It is also a settled fact that flies are agents for the diffusion of infectious, epidemic and parasitic diseases.

Flies multiply with such great rapidity that the descendants of one female, if undisturbed from April until October, will number from 1,000,000 to 1,200,000. One fly caught in April will give more relief than 5,000 caught in July.

An exceedingly interesting history of the fly, its habits, uses, etc., will soon be published and gratuitously distributed by the Detroit Fly Paper Co., Detroit, Mich., manufacturers of Decey Fly Paper. Watch for it.

NO. 608 A WINNER. Even in an Off Year.

The favor with which our Perfumes are received in our new 8 oz. bulb bottle, No. 608, exceeds our most sanguine expectations. Nearly every wholesale drug house in the west and south now carry complete stocks, and can promptly fill orders for the leading odors at prices mentioned in the following select list:

	PER BOT.	PER BOT.	
White Rose.....	\$1.50	Crab Apple Blossom.....	1.50
White Heliotrope.....	1.50	Trailing Arbutus.....	1.50

No. 608, 8 Oz. Jackson, Mich.
Trade tributary to New York City can be supplied by McKesson & Robbins.

PATENT LEATHER.

Japanned leather, generally called patent leather, was first made in America, says the New Orleans Times-Democrat (Leather Mfr.,) by Seth Boyden, of Newark, N. J., 1819-20. A smooth, glazed finish was first given to calfskin in France. The leather is carried expressly for this purpose, and particular care is taken to keep it as free as possible from grease; the skins are then tacked in frames and coated with a composition of linseed oil and umber, in the proportion of eighteen gallons of oil to five of umber, boiled until nearly solid, and then mixed with spirits of turpentine to the proper consistency. Lampblack is also added when the composition is applied, in order to give color and body. From three to four coats of this are necessary to form a substance to receive the varnish. They are laid on with a knife or scraper. To render the goods soft and pliant each coat must be very light and thoroughly dried after each application. A thin coat is afterward applied of the same composition, of proper consistency to be put on with a brush, and with sufficient lampblack boiled in it to make a perfect black. When thoroughly dry it is cut down with a scraper having turned edges, when it is ready to varnish. The principal varnish used is made of linseed oil and Russian blue boiled to the thickness of printers' ink. It is reduced with spirits of turpentine to a suitable consistency to work with a brush, and then applied in two or three separate coats, which are scraped and pumiced until the leather is perfectly filed and smooth. The finishing coat is put on with special care in a room kept closed and with the floor wet to prevent dust. The frames are then run into an oven heated to about 175 degrees. In preparing this kind of leather, the manufacturer must give the skin as high a heat as it can bear, in order to dry the composition on the surface as rapidly as possible without absorption, and cautiously so as not to injure the fiber of the leather.

PARACELSUS.

The recent celebration of the quacren-tenary of Paracelsus' birth has evoked a number of more or less new and authentic anecdotes concerning the famous chemist, says Chem. & Drug. On account of Paracelsus' wandering habits it is almost impossible to trace his career in proper sequence. The period of his life which is best known is that from 1526, when, owing to the influence exerted on his behalf by Oecolampadius, he was appointed City Physician and Professor of Medicine in Basel. Paracelsus was a ruthless reformer, to whom old customs, unless founded upon common sense, were abominations; hence his constant quarrels with his fellow academicians. He gave his lessons in the German vernacular and was a determined enemy of Galenism and Arabism, then paramount in medicine. Paracelsus did much to simplify the composition of remedies and to introduce simple chemical bodies into therapy. In his personal habits, Paracelsus was exceedingly simple. He refused to wear the red official costume of physicians and professors, and consistently employed the German language (often an exceedingly simple variety of it) instead of the dog-Latin of his contemporaries. As a city

physician, he insisted upon the strict inspection of pharmacies, thereby rendering himself exceedingly unpopular with the pharmaceutical craft, so much so that insulting doggerel and other lampoons directed against him were frequently posted up in Basel-Market place by his enemies. The cause of his leaving the city was the result of an action brought by him in 1528 against a prominent cleric who had promised him a fee of 100 florins to be cured of an ailment. Paracelsus effected a cure by means of three opium pills, for which the church dignitary refused to pay more than the official tariff of six florins. The City Council found against Paracelsus, who at once left the city. First he went to Esslingen, where his family owned a house, which is said to be still standing. Then he wandered for ten years throughout Southern Germany and Austria, and finally died at Salzburg, in the Tyrol. Paracelsus has been reported to have been the author of 354 treatises, of which, however, only a portion was ever printed. Many of the works ascribed to him are probably spurious. The largest collection of his works is in the museum at Salzburg.

NOTES ON NUTS.

It was "chestnut night" with the Boston Druggists' Association at Young's, the other evening. Everybody had received orders to search his memory for "chestnuts," the older the better, and many a hearty laugh went round as the evening progressed. President Babcock's reading of "Notes on Nuts" was a feature of the occasion. The jingle is subjoined:

Poets have sung of the fruits of the vine
And their verses made many times o'er
In praises of wine—ambrosia divine,
Which the gods first revealed to old Noah.

But when has the bard been inspired to sing
By "Thoughts on Cas-tan-e-a ves-ca?"
This nut to him no affluat can bring,
Unless he's a wit or burlesquer.

I know I am neither, yet I shall try
On the chestnut to drop into verse.
I'm sure all I do will be nuts to you,
Though my poetry cannot be worse.

But why only at chest-nuts turn my hand,
When the woods are full of ev'ry kind?
I think I will try this theme to expand
And poetize all the nuts I find.

First on the list is that cud plebein,
To ev'ry rural citizen dear,
The nuts he doth munch as his fav'rite lunch,
Are called Ar-a-chis hy-po-gae-a.

We crush its crisp shells on the floor be-low,
In the theater, cars, and elsewhere.
Wherever we go, at circus or show,
Its rank fragrance impregnates the air.

There still remain nuts I must not omit,
Nuts (but for ice cream I cannot pass) by;
Or gall-nuts for ink; or nutmegs for drink,
Or custards or green apple pie.

Some nuts are so hard they cannot be crack'd,
Ideas on religion or marriage;
Nuts (but for ice cream I cannot pass) by;
Nuts on drug-mill or wheel of carriage.

Time falls me to discourse on all the nuts
Which grow in the woods or forest,
I'll stop my speed with the hazel and beech
Or you'll have to consult an aurist.

If we should adopt a national nut,
To place beside our fleur de patrie,
I'm sure the cake, would the peanut take,
As the nut of our native country.

There's a nut which grows in tropical clime
With dark leaves and blossoms sur-rounded—
'Tis the almond sweet—delicious to eat
Salted, plain or sugar-compounded,
At dessert the walnut finds its true place,
What is finer with coffee than these?
Their meats we transfix with silver nut-picks
Mid the smoke of cigars Havanae.
Though I started to write of the chestnut,
Upon this I've said scarcely a word,
But I'll bring what I've penn'd to speedy end
And cease writing these verses absurd.

MORAL.

Each nut is a seed which planted will grow
And in time will become a tree,
So our chestnut old are germs which unfold
In good will and fraternity.

ELECTRIC INDICATING THERMOMETER.—M. Barille (in Compt. rend., Pharm. Jour. & Trans.), describes an ingenious application of electricity as an aid in preserving a constant temperature during laboratory operations. An ordinary mercurial thermometer has the upper half of the stem somewhat enlarged in diameter, the lower, narrow portion alone being graduated. A fine platinum wire (a) is sealed into the bottom of the bulb, so that one end projects into the mercury, and a similar wire (b) is fixed into the upper part of the stem, running the whole length of the thickened portion. A third platinum wire (c) extends from a point about one-third the distance down the narrow graduated part of the stem, up past the free end of the second wire as far as the middle of the latter, round which it is then twisted in a spiral, whilst a steel needle to serve as an index is soldered to its extremity. Finally, the air in the upper part of the stem is replaced by orthotoluidine—which boils at 200 deg., freezes at -20 deg. and does not appreciably affect the mercury—the opening is sealed, and the thermometer fixed in a suitable copper frame, the lower part of which may be readily introduced into the openings in drying ovens, etc. A small, permanent horse-shoe magnet is next placed so that its poles are opposite the index, which it maintains in position by its attractive influence, so that the movable wire (c) becomes practically a prolongation of the fixed wire (b), along which it slides by means of the spiral. By sliding this magnet up or down the side of the thermometer tube a corresponding movement of the wire (c) also takes place. The free extremities of the wires (a) and (b) are attached to binding screws, which are in turn connected with an electric bell and battery. Now, when the surrounding temperature is sufficiently high to expand the mercury until it comes in contact with the lower extremity of the wire (c), the circuit is immediately closed and the bell rings; and by regulating the position of the permanent magnet, and consequently the steel index on the upper end of the wire (c) it is possible to fix the maximum temperature at any point desired.

ASAPROL.—A soluble derivative of B-naphthol, sulfonic ether of B-naphthol, as calcium salt, white powder, very soluble; resembles sodium salicylate as antiseptic, and remedy in acute articular rheumatism. Dose, same as the salicylate.

TRIKRESOL.—The preparation of cresols as a disinfectant for hygienic and surgical purposes is the subject of a paper by Dr. O. Liebreich (Therap. Monatsch.), who says: "The advantages and disadvantages of carbolic acid are sufficiently well known to warrant the search for substances free from its poisonous properties, that still retain its utility. Those compounds in close chemical relationship to carbolic acid were the first investigated. The nearest homologues of carbolic acid are the cresols which are also obtained from coal-tar, together with carbolic acid, and numerous other products. As represented by chemical formulae, in which one hydrogen atom of carbolic acid is replaced by a methyl group, it is evident that there are three possible isomeric modifications of the cresols. These three modifications of the cresols are all known, and are called respectively ortho-cresol, meta-cresol and para-cresol. The preparation of these bodies in a pure state is an extremely difficult operation, the principal difficulty consisting in their separation from each other when mixed, as their boiling points are very close. Ortho-cresol boils at 188° C., meta-cresol at 201° C., and para-cresol at 186° C. It is indeed possible to prepare them individually by the action of nitrous acid upon the corresponding toluidines or from the toluene sulphonic acids, in the same manner as carbolic acid is prepared from anilin, or for benzene sulphonic acid. Further ortho-cresol is obtained alone from camphor, meta-cresol from thymol, and para-cresol from the decomposition products of animal secretions. None of these methods are, however, sufficiently simple to admit of their economical application for the production of a medicinal product. The preparation of the three mixed cresols in a state of chemical purity must therefore be regarded as a great advance in chemical technology. The choice of the name Trikresol for the mixture of the three pure cresolic compounds is extremely fortunate as compared with the hyperphantastic and irrelevant nomenclature usually indulged in. In the crude carbolic acid, erroneously called 100 per cent carbolic acid, the cresols are contained together with other bodies. The great disinfectant value of this product is undoubtedly due to its percentage of cresols. It has been attempted to bring this so-called 100 per cent carbolic acid into a condition of practical utility by the addition of resin soap as solvent. This preparation, known as cresolin, yields a milky solution when mixed with water, but the lowered percentage of disinfectant ingredients, especially of cresols, and the irritant qualities of the solution of resin soap have placed certain limits on the use of this preparation. Lysol is a solution of the same product in sodium cresotinate. The solvent possesses no great disinfectant properties, and the composition of this preparation is as liable to variation as the former. Solinol has a similar character. Lysol is a solution of 100 per cent carbolic acid in soap solution. All these preparations have found useful employment in medical practice, but their use must be considerably limited by variation in the percentage of cresols or by the presence of deleterious bye-products. These facts are apparent in the diverse results obtained with them by different experimenters. The preparation of the cresols in a pure state demonstrates, however, that no special solvent is required to make an aqueous

solution. The pure cresols dissolve alone to the extent of 2 to 2.5 per cent in water at ordinary temperatures, and a ½ per cent solution suffices as a rule for external application, although the strength can be increased to 2 per cent as occasions arise. The cresols are indeed only insoluble when contaminated with either liquid or solid hydrocarbons, to the interesting experiments of Traubner, a 1 per cent aqueous solution of the cresols answers to all surgical requirements. This new product is therefore an important discovery, because it is now possible for medical men to prescribe trikresol in a series of preparations of constant composition, which were formerly only obtainable as specialties under various names and of uncertain composition."

ANTIPYRIN, ANTIFEBRIN AND PHENACETIN. though chemically not related to each other, are medicines which have enjoyed a considerable degree of therapeutic rivalry. As might be expected, some distrust has followed the popularizing of these remedies. In private practice there have been many grave cases of poisoning induced by one or other of the three analgesics, and reports were becoming so frequent that the British Medical Association deputed its therapeutic committee to inquire into the whole matter. The committee (says Chem. & Drug.) was presided over by the accomplished pharmacologist, Professor D. J. Leech, of Manchester, and the various branches of the association assisted in the inquiry. Experience in private practice was particularly aimed at, because a wider license than obtained in hospital practice is there given to patients in using the drugs, and consequently ill effects were more likely to be seen there. The points of the inquiry were: First, the amount of experience in the use of the drugs possessed by the observer; second, the doses habitually given; third, the nature of the ill effects; fourth, their frequency; and, fifth, opinions as to the usefulness of the drugs. As 20 reports were sent in, the inquiry has been sufficiently comprehensive to form a conclusive statement regarding the behavior of the drugs. The result showed antipyrin to be the most extensively used of the three analgesics, and antipyrin was stated to be a much safer drug in every way than antifebrin. As to the ill effects of antipyrin, it is noteworthy that 73 per cent of the reporters have never observed them in their practice; and in the case of those who have observed grave symptoms, there is no difficulty in tracing the trouble to excessive dosage. The ill effects produced were collapse and death (rheumatic fever) when 80 grains were given in five hours, collapse following such doses as 30 grains twice given, heart-weakness, depression, dyspnoea, loss of speech, temporary mania, cyanosis, etc., with doses of 15 to 20 grains repeated at intervals of from an hour to four hours. Cyanosis was rarely observed. Those who give antipyrin in doses of 10 grains or under have no experience of ill effects: it is those who give it in larger doses, or who allow it to be taken too frequently, who have supplied the committee with the above particulars. The same practically obtains in the case of antifebrin, but here the grave symptoms followed quite orthodox doses, viz: within the official limits of 3 to 10 grains—and the ill effects were rarely free from cyanosis. More-

over, the committee records the fact that antifebrin poisoning is much more frequent than antipyrin poisoning. In the latter case 27 per cent of the observers only have met with such cases, but in the former the percentage is 44; in fact, the committee puts the matter forcibly in saying: "Ill effects following the administration of antifebrin are both absolutely and relatively more frequent in their occurrence than is the case with antipyrin." It is also added that this is not due to excessive dosing alone, but to "its being less safe and less constant in its action than antipyrin." On the dose point the committee is quite stringent: "To give antifebrin in doses of 5, 6, 8 or 10 grains, still more to repeat these after a short interval, is a highly injudicious procedure. Such doses are altogether excessive."

There is little to be said about phenacetin, except that it "appears to have a notable freedom from injurious action. Seven out of 30 observers report ill effects, and it may be noted that 5 grains every three hours for three days has induced collapse, but the "drug appears to be in exceedingly good repute with those who have any extensive experience of it, more especially as an analgesic." Sir Andrew Clark usually prescribed 10 grains every hour to begin with, (for four doses, but ordered even larger doses when he had the opportunity of closely observing the effects. Whether the comparative safety of phenacetin is due to its slow dissolution or to its chemical constitution there is no evidence to show; but in all probability safety does not lie in slow dissolution, for acetanilide is as insoluble a body as phenacetin. The lessons which pharmacists may learn from the inquiry are that antipyrin and phenacetin should be generally given in doses of 5 to 10 grains, and should not be repeated oftener than every four hours. Antifebrin is unsafe in doses over 5 grains, and 2 grains of it is equal to 10 grains of antipyrin, but less certain in action.

PHENOL, CHLORINE AND BROMINE DERIVATIVES.—Para-chlorine phenol, crystalline; odor of phenol; slightly soluble in water. Ortho-brom-phenol is a violet-colored liquid. Both employed in the treatment of erysipelas; 1 to 2 per cent in ointment.

ANTISPASMIN.—A preparation consisting of one molecule of narecine sodium combined with 3 mol. sodium salicylate; contains about 50 per cent narecine. A very soluble and pure form of narecine. Recommended as hypnotic and sedative. Dose, 0.006 to 0.1 gms.

MALAKIN.—Salicylaldehyd-para-phenetid. Closely related to phenacetin. Yellow crystals, insoluble in cold water; contains about 50 per cent salicylaldehyde. Employed in muscular rheumatism, neuralgia. Dose, 4 to 6 gms. daily.

TOLYLANTRYPINE DERIVATIVES.—The chlorhydrat, isonitroso, monobromo and monolodo. These are all less soluble than the corresponding antipyrine derivatives, like tolypyrine itself, being only soluble 12 parts in 100 parts of water.

PHEDRETIN.—A phenol derivative, composition not given; tasteless white crystals, insoluble in water. Doses of 0.5 to 1 gm. a powerful diuretic.

MAGAZINES.

Outing is, as usual, full of interest to the lovers of nature and sports. It contains "Let No Man Put Asunder," by Annetta Josefa Halliday; "My Adventure With a Lion," by Herman Rave; "Modern Canoe Building for Amateurs," by Henry L. Strowbridge; "Quaint Artistic Haunts in Brittany," by Birge L. Harrison; "My First International Yacht Race," by Lieut. Wm. Henn, R. N.; "A Night's Sport in Cape Breton," by W. H. Mac; "A Race With the River," by L. Carew Shirley; "Stray Shots in the Land of Silver," by O. H. Howarth; "Fishing With the Spear," by Ed. W. Sandys; "Touring in Europe on Next to Nothing," by J. Perry Worden; "Six Months With a University Crew," by Ralph D. Paine; "A Morning With the Blue-Bill," by Ernest Willard, and "The Michigan National Guard," by Capt. Chas. B. Hall, 18th Infantry, U. S. A.

"The Ladies' Home Journal contains a very interesting article upon "How I Wrote 'Looking Backward,'" by Edward Bellamy. Portraits and sketches are presented of the wife of Robert Louis Stevenson, and of the wife of E. S. Willard, the actor. Alexander Mackenzie-Hughes has an article upon "The Care of a St. Bernard Dog;" Madame Blanc discusses "American Mistakes About French Women;" Mrs. S. T. Rover tells of "Wedding Breakfasts;" Palmer Cox shows the "Brownies in Florida," and W. D. Howells continues the recital of "My Literary Passions."

Popular Science contains a continuation of the series of papers by Dr. Andrew D. White, entitled "New Chapters in the Warfare of Science," giving a brief sketch of the early theological teachings regarding animals and man. George A. Rich argues affirmatively on the question "Trusts Their Own Corrective." Prof. Joseph LeConte gives "New Lights Upon the Problem of Flying." "The Methods of Homing Pigeons" are discussed by C. F. Hodge, Ph. D. W. Lodian writes of "A Century of the Telegraph in France;" Prof. A. R. Wallace of "The Ice Age and Its Work;" Prof. James H. Dana "On New England and the Upper Mississippi Basin in the Glacial Period;" Horace T. Martin, of "The Beaver Eater;" Herbert Spencer of "The Late Professor Tyndall;" M. Lazar Popoff of "The Origin of Art," and W. W. Billson gives "An Illustrative Chapter on Legal Development."

Lippincott's has for its complete novel "The Flying Halcyon," by Richard Henry Savage; and the other stories are "Cap'n Patti," by Ella W. Peattie; "For Remembrance," by Elizabeth W. Bellamy; and installments of the serial "The Trespasser," by Gilbert Parker. Other articles of interest are "The F. M. C.'s of Louisiana," by P. F. deGournay; "The Librarian Among His Books," by Julian Hawthorne; "Hawaiian Traditions," by Abraham Formander; "Co-operative Housekeeping," by H. C. Walsh; "Storage Battery Cars," by George J. Varney; "Heroines of Human Comedy," by Junius Henri Browne.

St. Nicholas' feast for the young people is made up as follows: "Our Wolves and Foxes," by W. T. Hornaday; "On a Glacier in Greenland," by Albert White Vorse; "The Real Sunflower," by Rudolph Francis Bunner; "Recollections of a Wild Life," by Charles A. Eastman; "Too Sharp for the Czar," by David Ker;

"San Francisco," by Charles H. Shinn; "Mrs. Cecile Viets Jamieson," by Olive Otis; "The True History of the Flood," by Mary Bently Thomas; "Barfoddis," by Francis E. Gifford; "A Letter From Bruin Polar Bear," by F. S. Church; installments of the serial "Jack Ballister's Fortunes," by Howard Pyle, and conclusions of "Toinettes Philip" and "Tom Sawyer Abroad."

The Literary Digest, which has been lately enlarged, shows a very attractive array of live topics in its number for March 29. Among these are papers on Nationalization of Railways; The Canadian Premier and the President of the United States; A German View of Socialism in the United States; The Elmira Reformatory; Sound Economics in Congress; A Frenchman's Opinion of Female Education in the United States; Electricity in Art; Russian View of the American Press; Egypt in the Time of Moses; Ancient Churchmen and Politics; The Fatherhood of God; Ocean Vegetation, etc. Published by Funk & Wagnalls Company, 18-20 Astor Place, New York.

The North American Review shows an array of matter which is exceptionally interesting. Cardinal Gibbons contributes an article entitled "Personal Reminiscences of the Vatican Council;" Justin McCarthy writes of "New Parties in Parliament;" Hon. Wm. F. Wharton of "Reform in the Consular Service;" Hon. Thomas H. Carter of "The Republican Outlook;" Charles H. Cramp of "Our Navigation Laws;" Robert A. Pinkerton of "Forgery as a Profession;" the President of Brown University of "Tariff and Monetary Reform;" Dr. Louis Robinson of "Wild Traits in Tame Animals;" Arthur Silva White of "An Anglo-American Alliance;" Dr. Joseph H. Senner of "How We Restrict Immigration;" Governor Stone, of Mississippi, of "The Suppression of Lawlessness in the South," and Mark Twain gives a "Private History of the Jumping Frog" Story.

The Century has for its frontispiece a portrait of Matthew Arnold, and another notable artistic feature is a story told by pictures by the well-known artist Andre Castaigne, the subject being the course of the emigrant "From the Old World to the New." The literary features consist of "Mors Benifica," by Edmund Clarence Stedman; "Ellen Terry in the Merchant of Venice," by Thomas Bailey Aldrich; "My First and Last Balloon Ascention," by Robert V. Sewell; "Answered," by Richard Henry Stoddard; "Sophocles Leading the Chorus of Victory," by John Donohue; "A Comet Finder," by Frank W. Mack; "Wild Flowers of English Speech in America," by Edward Eggleston; "Pit Matinee Monotones," by Geo. Wharton Edwards; "A Summer Month in a Welsh Village," by Susan Nichols Carter; "The Quest of the Arbutus," by Charles G. D. Roberts; "The Supply at St. Agatha's," by Elizabeth Stuart Phelps; "Driven Out of Thibet," by W. Woodville Rockhill; "Miller's Life at Barbizon," by Pierre Millet; "Hunting an Abandoned Farm in Connecticut," by W. H. Bishop; "Gods of India," by F. Marion Crawford; "Matthew Arnold," by Florence Earle Coates; "The Red Box at Vesey Street," by H. C. Bunner; "Out of Sight, Out of Mind," by George E. Waring, Jr., and installments of the serial "Coeur d'Alene," by Mary Hallock Foote. The Atlantic Monthly presents both a

political and warlike aspect. The former is represented by "The Referendum in Switzerland and America," by O. Lawrence Lowell, and "Some Causes of the Italian Crisis," by W. R. Thayer; the latter by "General Lee During the Campaign of the Seven Days," by Eben Greenough Scott, and "War's Use of the Engines of Peace," by General Joseph L. Brent, of the confederate army. "Early Latin Poetry" is the subject of an able article by Professor Tyrrell, of Trinity College, Dublin. Richard Burton writes of "Nature in Old English Poetry;" Mrs. Olive Thorne Miller of "Secret of the Wild Rose Path;" Mrs. Elizabeth Cavazza of "Jerry: a Personality;" Agnes Repplier of "Opinions," while "The Windigo," by Mrs. Catherwood, and installments of Mrs. Deland's "Philip and His Wife" make the number strong in fiction.

The report of the Commissioner of Patents for the year ending December 31, 1893, shows that there were received 37,233 applications for patents; 1,060 applications for designs; 12 applications for reissues; 2,247 caveats; 1,899 applications for trademarks; and 401 applications for labels. There were 23,670 patents granted, including designs; 99 patents were reissued; and 1677 trade-marks were registered. The number of patents which expired was 14,172. The number of patents which were by operation of law forfeited for non-payment of the final fees, was 1,102. The expenditures were \$1,141,033; the receipts over expenditures were \$101,833, and the total receipts over expenditures to the credit of the patent office in the treasury of the United States amounted to \$1,281,743. At the close of the year there were 6,264 applications awaiting action.

The camphor tree has been tested in California and seems well adapted to that state. In the recently issued digest of experiment station work the following occurs: "A tree is instanced 45 feet high, branched low and fully 2 feet through at the base, at an age of about twenty years. There is no doubt that the tree will be found to be adapted to a large portion of the state, and will grow without irrigation, wherever a pear tree will succeed without it. Aside from the value of the drug, the wood, which generally does not enter into its manufacture, has a high value for a number of purposes, and would perhaps alone compensate for the cost of rearing the plantation, leaving the root, young branches, and foliage (the camphor-producing material) at a nominal cost.

To obtain a genuine Russia odor on Russia calf and sides, the following process has been patented in Germany (Patent No. 71,072): The leather is treated with ordinary birch tar in the usual way and then goes into a bath of willow bark or into a weak solution of salicin in alcohol. This procedure has the effect of changing the birch tar to a rubbery, waterproof substance, and at the same time takes away the acid or tarry smell. The solution of salicin in alcohol is obtained by dissolving 115 grammes of salicin in half litre of 95 per cent alcohol, and 100 litres of water.

The Leather Manufacturer has tested this process and found that it sweetens the odor of Russia leather in a remarkable degree, entirely taking away the disagreeable, tarry smell and leaving the delicate odor of refined birch tar oil.

THE MARKETS.

The fluctuations noted in this market report are those affecting goods in original packages and jobbing lots. A complete price list, showing quotations as made by jobbers to retailers, will be found upon another page under the head of "Prices Current."

Advanced—Quicksilver, Cantharides, Saffron, Anise Seed, Celery Seed, Oil Peppermint, Orange Peel, Spermaceet, Curacao Aloes.

Declined—Optum, Alcohol, Damiana Leaves, Ergot, All Orange, Oil Wintergreen, Jalap, Menthol, Cubeb Berries.

New York, April 7.—The general movement of supplies into channels of consumption during the past two weeks has been of only moderate volume, and the anticipations of dealers have not been realized; in fact, the market has been comparatively quiet, and expressions of disappointment frequent. The dullness of trade in some commodities has influenced a weaker feeling among holders and a consequent decline in values, but, on the other hand, a number of advances have occurred as the result of natural causes, and, generally speaking, the market has a fairly steady undertone. The speculative element is almost entirely eliminated so far as operations in the drug line are concerned, and transactions of magnitude are exceptional. Tariff agitation is still a disturbing factor, and the articles in this department most likely to be affected by the proposed changes are naturally more or less unsettled. Consumers are still pursuing a hand to mouth policy by purchasing only in accordance with actual current necessities, and business is almost exclusively of a light jobbing character, the larger buyers evidently preferring to await future developments. Values in many instances are unusually low, and in others supplies are likely to fall short of consumers' requirements, consequently holders of those articles are not anxious sellers, and the outlook is favorable for improved prices in the event of any important increase in demand.

OPUM.—The downward tendencies of values has continued during the interval under review, and a further decline of 26 to 27 cents per lb. is recorded without stimulating interest from either large or small buyers. The depressed condition of the market is attributed to lack of orders and unusually heavy receipts, the latter being due to the anxiety of importers to increase their holdings before the anticipated duty becomes operative. The arrivals since January 1 are fully abreast of the total imports of last year, and as the larger consumers and manufacturers are abundantly supplied, it is not surprising that dullness and depression should be the characteristic feature. Various rumors are current regarding the proposed tariff on this article, and some predict that a 22 per cent duty is probable. In any event, there is nothing at present to warrant an early improvement, and buyers are evidently looking for still lower prices.

POWDERED OPUM.—Continues to decline in sympathy with the gum, and purchases are limited to actual necessities.

MORPHINE.—Is without quotable change, and the bulk of the business in progress is confined chiefly to deliveries on contracts.

QUININE.—Has ruled fairly steady up to within the past few days, when an easier feeling developed owing to pressure

to sell on the part of several holders having a surplus, by reason of deliveries on contracts expiring on the 1st inst. The accumulation of stock is due to a falling off in demand, no large orders having been received recently and the anxiety to realize has apparently had the effect of inducing buyers to hold off. When supplies are again wanted to any material extent a reaction will probably follow, and the present condition of affairs is considered only temporary. It was generally expected that by this time foreign manufacturers would announce, through their agents, a further advance, and their failure to do so has caused considerable disappointment.

LOD LIVER OIL.—Values have reacted slightly from the extreme figures quoted two weeks ago, but there is no disposition shown by holders to part with round lots at the decline, and there are indications that a higher range of prices is likely to be established. Much will depend on the final result of the Flinmarken fisheries, which will probably be known within a few weeks. The Lafoten catch was only one-half that of last year, the Søndmøre a total failure, and up to date only unfavorable accounts are to hand from Flinmarken. It is claimed that the consumption in this country is steadily increasing, and that there is every prospect of a material shortage, and consequently most of the holders offer only sparingly.

ALCOHOL.—There is a continued unsettled and irregular market for Grain, with increasing competition from independent producers. The combination to-day announce a reduction of 6 cents per gallon, with the usual rebates. Wood is ruling steady at unchanged prices, with moderate trading in limited quantities.

QUICKSILVER.—Values were marked up 2 cents per lb. by the Pacific Coast combination of producers, but subsequently reacted 1 cent owing to free offering from dealers here.

BALSAM COPAIBA.—A moderately active consuming demand is reported mainly for Central American, but values are without quotable change. Other varieties are quiet and nominally steady.

BALSAM FIR.—Little or no interest is shown in either Canada or Oregon, and quotations are nominal in the absence of business.

BALSAM PERU.—The advance previously noted is firmly maintained, and offerings are limited to actual wants of consumers. The bulk of the stock is closely concentrated, and still higher figures are predicted by the principal holders, as there are no fresh supplies known to be on the way from primary markets.

CANTHARIDES.—Chinese have been receiving increased attention, and with the available stock under good control, values are hardening and some holders are quoting 3 cents per lb. higher.

DAMIANA LEAVES.—Are easier, and recent transactions show a decline of 16 to 12 cents per lb.

SAFFRON.—The principal holders of American have again advanced their views and values are 3 cents higher. The Alicante variety of Spanish is also higher owing to reduced spot supplies.

ERGOT.—Is exceedingly dull and offers to sell at concessions from previous prices (a) to attract buyers.

SENNA.—All varieties of both Alexandria and Tinnevely are in good, steady request from consumers, and values are

well sustained with intermediate grades of the latter tending toward a higher basis. Late advices from abroad indicate that the last crop is all in sight, and shows a considerable shortage.

ANISE SEED.—All kinds are becoming scarce, mainly owing to liberal purchases for export, and values are decidedly stronger, with Italian and Russian showing a higher range.

CORIANBER.—Is offering in a small way only, and sellers adhere firmly to the recent improvement in prices.

MUSTARD SEED.—Unfavorable crop reports have influenced a firmer tone to the market for California, but former prices are still acceptable.

CELERY SEED.—Has materially improved owing to the successful termination of efforts to control the entire visible supply. The manipulations of the markets both here and abroad were conducted with considerable skill, and the result is that only two firms are able to fill orders of any magnitude. A few small lots are still obtainable from outside holders, and as soon as they are disposed of a further advance is probable.

OF ORANGE.—A further reduction of 5 cents per lb. in Sanderson's brand and a corresponding decline in other grades is noted.

GOLDEN SEAL ROOT.—Is moving more freely and a firmer feeling is noted, with values indicating an upward tendency.

JALAP.—Is weaker under increased offerings. New root has been coming to hand quite freely, the arrivals being unexpectedly heavy, and the steady shrinkage in values has influenced dealers to hold off and not lay in their supplies until something more definite is known regarding the extent of the current season's output. Meantime stock is accumulating in first hands.

OIL PEPPERMINT.—The oil has developed no important feature or quotable change in prices, but H. G. H. is firmer, with sellers' views about 5 cents per lb. higher.

MESSINA ESSENCES.—Are without further change, but a revision of prices is anticipated shortly.

ORANGE PEEL.—The variety known as thick Malaga is exceedingly scarce, and extreme prices are asked for the few remaining bales in the hands of dealers. It is claimed that none was prepared this season at primary sources of supply, and that all markets will soon be exhausted.

DRAGON'S BLOOD.—Reeds are very scarce, and the limited stock is held with increasing firmness.

SPERMACEET.—Is higher under an improved demand and decreased stocks in manufacturers' hands.

TONKA BEANS.—The current demand is slow, but holders maintain firm views owing to exceedingly small stocks in first hands, together with unfavorable reports concerning the new crop.

MENTHOL.—Is offering at about 25 cents under previous quotations, and the tone of the market is easy.

CURACOA ALOES.—Show increased activity and a fractional advance in prices.

ASAFOETIDA.—Is in better supply, and the quality of recent arrivals is much finer than usual, owing to the restrictions adopted by the custom house authorities. Assortments show a much greater variety and a consequent wider range of values.

CUBE BERRIES.—Values show a lower range, and only small jobbing parcels are moving.

HENRY TRIMBLE.

IN this series of sketches of men who have gained prominence in the education of youth in the science and art of pharmacy there must be included that of Professor Henry Trimble, of the Philadelphia College of Pharmacy, whose courses of instruction in chemistry have won for that institution very favorable renown. Henry Trimble, the son of Stephen Trimble, was born May 22, 1853, at Chester, Pa. In his youth he attended regularly the Westtown boarding school in Chester County, receiving a very thorough general education from that well-known school. He was apprenticed in the drug business in 1872 and supplemented this equipment by the regular course of study in the Philadelphia College of Pharmacy, from which he received his diploma in 1876. Later, he passed two years at the University of Pennsylvania, pursuing special studies in organic and analytical chemistry, serving, as well, one year as assistant in organic chemistry. On May 28, 1878, he formed a business partnership with C. W. Warrington, with

whom for five years he conducted a retail drug business at the corner of Fifth and Callowhill streets, Philadelphia. In 1879 he was made assistant to Professor Sadtler at the Philadelphia College of Pharmacy, and four years later was appointed full professor of analytical chemistry in the college. In this connection he has since served, and during all the time he has had charge of the analytical laboratory he has directed many original investigations with students, the results of which have been published in the American Journal of Pharmacy, partly under the joint names of himself and student and occasionally in the name of the student alone. His own investigations have been largely with the class known as the tannins, and with which subject his name will certainly be linked indissolubly in the future scientific literature. These investigations he has collected together in a most valuable and comprehensive monograph "The Tannins," of which Volume I. was in 1892, and the second volume is now in press. This work has been very

favorably received both in this country and abroad. His "Hand Book of Analytical Chemistry," first published in 1885, has gone through four editions and has been used in a number of schools. It will be merged after this year in the larger "Text Book of Pharmaceutical Chemistry," which he is preparing with Prof. Sadtler, and which new and comprehensive work is promised for this fall.

Professor Trimble, on March 26 of the present year, was unanimously elected editor of the American Journal of Pharmacy, to succeed Professor John M. Maisch, who for many years had so ably presided over the destinies of this valuable journal. Professor Trimble has been a frequent attendant on the meetings of the American Pharmaceutical Association, to the proceedings of which body he has contributed a number of most valuable papers. His name and fame are widely known among pharmacists and chemists, not alone in this country, but abroad.

ENTERED AT THE DETROIT P. O. AS SECOND-CLASS MATTER

ESTABLISHED 1887.

THE PHARMACEUTICAL ERA.

SEMI-MONTHLY.

Issued on the 1st and 15th of Each Month.

After this issue all Communications for this paper should be addressed to:

D. O. HAYNES & CO., Publishers,
106 Fulton St., NEW YORK.

For Subscription and Advertising Rates see Advertising page 50.

EDITORIAL.

THE ERA AND ITS REMOVAL.

The present issue marks an important epoch in the life history of the Era, the point where to farther advance in its mission, to foster and further the best interests of its clientele, the drug trade, it must be placed in closest touch with enlarged sources of supply in material for its reading pages and in business patronage. When the Era first saw the light in January, 1887, little foreseen were its rapid and healthful growth and its quick attainment of a position as leader among pharmaceutical journals. From the start the support received was most encouraging to its founders, and each succeeding issue found changes of one or another nature necessary to accommodate increase of material and to widen its field of usefulness. Its history is told with some minuteness elsewhere in this number, here it but remains for it to take leave of its friends in its birthplace and to bespeak the kindly welcome of the trade of the city it now makes its home.

Though the Era has at no time been a local publication, still it is with heartfelt sorrow that the publisher and the members of the editorial and working force, bound in close social and business ties to Detroit, which has loyally stood by the Era in its early struggles, and rejoiced and shared in achieved prosperity, must see a loosening of these bonds, but be it understood that these ties are but loosened, not sundered, and remain to connect us in closest sympathy and accord with Detroit's drug trade. In its several branches. Will our Detroit and Michigan friends receive these expressions of regret as a faint measure of our appreciation of their cordial and generous support, which has augmented whatever portion of success that has rewarded our efforts.

The Era goes to New York because that city is the head center of drug affairs in this country. The drug business is there represented more fully in each of its many ramifications, general and side lines, than in any other city in the United States. For widest connection with the best of trade and professional literature, for latest reports of market fluctuations, for prompt notice of trade and news happenings New York offers superior advantages, advantages which the Era will enlist in its service to supply its readers with what is latest and best in all matters pharmaceutical. To bring the Era as a drug journal still nearer to our ideal, this move we believe a wise one.

For the cordial welcome and the liberal

patronage already extended to us by the New York trade we are truly thankful. With a desire to do our part conscientiously we accept these evidences of good wishes, and shall try to merit them.

THE SANITARY CHEMIST.

Dr. Vaughan, than whom none stands higher as an authority on sanitation, sketchily outlines the duties and responsibilities of the sanitary chemist. The sanitary expert stands as a protector of the people against the countless sources of disease and infection, whose nature and methods of manifestation and dissemination are almost unknown to the public. Milk and water, the most valuable and the most innocent of products for the supply of human needs, may under certain circumstances, become the active propagators of disease, and it is in the examination of these articles that the sanitary chemist finds his greatest responsibility. A word is said about the adulteration of food products in general, with the implication that greater care should be exercised by our law-makers and law executors in the protection of the people against cheapened or dangerous articles for consumption.

HOW AND WHAT TO STUDY FOR EXAMINATION.

We have pleasure in presenting a practical paper which outlines a course of study prescribing definite work and definite hours for the guidance of embryo pharmacists in the preparation for examination by the state boards of pharmacy. The paper is a timely and valuable one and serves to answer well the host of inquiries which come to the editors of pharmaceutical journals. There are many young men who have entered upon pharmacy as a life work, who are unable, through force of circumstances, to acquire the systematic training afforded by the college of pharmacy, and who find it necessary to fit themselves by home study for the duties of their profession. This class will find the suggestions of our contributor of great pertinence and assistance in their work, and we heartily commend the paper to their attention as a thoroughly practical and reliable exposition of the subject.

ARE ANILINES POISONOUS?

Prof. Leffmann gives us an interesting and instructive paper in this number in answer to the query which serves as a heading to these few remarks. Some time ago we received Weyl's valuable book on aniline colors, and gave the substance of his conclusions that the majority of these colors were not toxic, though to be sure, in the minority are a few which must be used with caution. It is gratifying to be told by our contributor that his conclusions are of the same nature, and that as a rule aniline colors may be used with confidence in their safety. He points out those whose employment is safe, but the most important portion of his paper is that which deals with the misnaming and misbranding of colors, whereby a dangerous one may be mistaken for an innocent one. Instances where similarity in names has led to serious results are not rare in pharmaceutical history, and it is to be regretted that manufacturers of colors are so lax in assigning proper designations to their

products, which designations shall in some manner indicate their nature. Fanciful and arbitrary names should not be employed in exact science. We are glad in presenting Prof. Leffmann's paper that this matter is brought to attention, and we are sure that the information given by the writer will be of great practical benefit to pharmacists.

EXAMINATION QUESTIONS.

The answers to Series No. 2 are given in this issue. In looking over the replies it has been observed that they are either very good or very bad, showing that the drug clerk is either posted or not posted. To paraphrase an old doggerel, "When he is good, he is a very good indeed, but when he is bad, he is horrid." But we would emphasize one very important criticism, that too little familiarity with the pharmacopoeia is displayed. The revision of 1890 has been official since January 1, and the book was procurable for some three months prior to that date. In a number of the questions it is distinctly required that the official requirements or descriptions be given, and failure to do so constitutes a faulty answer, though the reply may be correct in all other particulars. One object of these questions is to stimulate study of the pharmacopoeia, and the pharmacist has no excuse for unfamiliarity with his official guide. The pharmacopoeia should be his ever present reference and text book.

These examination questions elicit hearty commendation from those who have grown old in the harness, as well as from the clerk and apprentice. The former find them of service in "brushing up," and the latter are shown the directions in which to prosecute their studies. The liberal response is very gratifying proof of the value of the feature.

EVOLUTION IN EDUCATION.

During the past two or three decades there has been a notable evolution in the methods employed in teaching the professions and sciences. The changes pertaining to this evolution have not at any period been very marked or revolutionary in character, but the result has been that, comparing the present status of educational methods with those obtaining twenty years ago, there is seen a very great departure from methods then generally enforced. Nowhere have these changes been more noticeable than in the teaching of pharmacy. While realizing to the fullest extent the value of theoretical information, practice has been insisted upon, and to-day our schools are equipped with every facility for training the eye and hand as well as the mind. It is not very long ago that all the students of colleges were forced to take the same courses of study without regard to what might be their after position in life and the requirements of their chosen calling, but we have recognized the fact that the purpose of all knowledge lies in its application to everyday life and its ability to earn for one a living. There are, in our advanced institutions, opportunities presented to the student for pursuing his studies in whatsoever direction he may desire in order to equip himself for after life. While didactic lectures will never lose entirely in importance, much attention is now paid to manual training. Our

colleges of pharmacy have their laboratories for chemical, pharmaceutical, botanical and microscopic work, and the student of the present day has placed before him facilities for adequately qualifying himself for the responsible duties he is to assume.

WHAT OUGHT TO BE THE CHARACTER OF SCHOOLS OF PHARMACY?

It is a question that concerns every pharmacist, whether he or his ever studied in the college or not. It may be answered, first, the school of pharmacy should hold its doors wide open to any practicing pharmacist to study any branch of the profession to any extent he may desire, with libraries, laboratories, lectures, museums, and living authorities at command. In the second place it may be set down that the school of pharmacy, like the school of medicine, or that of mechanics, should be of university grade, so far as the order of secondary education in this country makes it possible. The course of study for graduation should be as severe, as well advanced, and not less than two-thirds as long as that for graduation in medicine. It is desirable that the college year should be as long as nine months, unless more than two college years be taken. The entire time of the student should be held during the term, unless, indeed, much more than two college years be required. The value of the diploma of graduation in pharmacy should not be lower, in an educational point of view, than the best value of medical graduation in this country. And above all, the standard of entrance into the school of pharmacy, for its students in course toward graduation, should not be lower than good high school graduation, whether medical schools preserve this standard or not. With open opportunity for every registered pharmacist to study in the college, the honor of its degree should be given only to those of good culture, full scholarship, and trustworthy training in the college work. In the third place the school of pharmacy should be a place of research, a source of contribution to science, and it should be provided and sustained to this end. In this service of original work alone the school can return to the world more than the cost of its maintenance.

OUR MOVING DAY NUMBER.

With much feeling of pride and satisfaction we present to the drug trade this special issue of the Era, which commemorates its removal from Detroit to New York. We believe it to be the most elaborate and expensive of anything ever issued by an American drug journal, and the edition, if we are correctly informed, is the largest of any drug paper in this or any other country. In preparing this MOVING DAY NUMBER we have had most liberal support from our advertising patrons and contributors, given expression through exercise of the highest resources of the lithographer, engraver and printer. Among the attractions of the number we would mention the variety and volume of the reading matter, covering a wide and appropriate range of subjects, including several specially prepared papers, thoughtful and practical, from well-known writers. The history of the Era and description of the methods of its production are of interest, the pages devoted to the New York drug trade

constitute an instructive section, and the several articles descriptive of well-known manufacturing houses and their business careers are not lacking in appropriateness. In illustrations there is great profusion, all of artistic excellence and high grade mechanical execution. The beautiful lithographed cover bears designs appropriate to the occasion, and is commended to notice and preservation for its intrinsic worth. The advertising pages are abundant, their appearance and variety attracting attention and winning commendation. It is unnecessary to further specify the features of this number. We are proud of it, and are positive its recipients will acknowledge the justice of this pride. Over twenty tons of paper were required to satisfy the appetites of the printing presses in its production, and in other directions the outlay of labor, time and money has been equally generous.

To our contributors and advertising patrons we extend our hearty thanks for their co-operation in the preparation of the number, and to the firms whose widest facilities were exercised in its production. We are specially indebted to Messrs. Geo. H. Buek & Co. and the Moss Engraving Co., of New York; and to the Peninsular Printing & Publishing Co., the Record Printing Co., and the Richmond & Backus Co., of Detroit, for their careful attention to mechanical and artistic details.

FAULTY TEACHING.

Recently we published a few criticisms upon a lecture delivered upon the subject of incompatibility. Elsewhere in this issue we present a rejoinder from the gentleman who delivered the lecture in question. We publish his reply for the reason that we always wish to give every man opportunity to maintain his own position and present his views in matters of this sort, and not that we are at all convinced by his presentation of the case, on the contrary we believe our statements better established by his reply. The quotations from various authorities which he gives are not, as he believes, in support of his own position, but of ours. Notably those from Roscoe, who says that chlorine is found in hydrochloric acid as an impurity and that hydrochloric acid changes calomel to corrosive sublimate. Both of these statements are true, but their application is not such as Prof. Kennedy would have it. A trace of chlorine may possibly be found in hydrochloric acid, but the oxidation of calomel is not due to this impurity, as the lecture states. The change is occasioned by the hydrochloric acid itself, the calomel undergoing a double decomposition, a reduction and an oxidation, both free mercury and mercuric chloride being formed.

So in the case of nitrous ether. Acetic acid, it is true, is present, but acetic acid itself is not an oxidizer of potassium iodide. This oxidation change is caused by the nitrous compounds, and takes place in acid mixture, and we ask is it not generally the case that nitrous ether is acid, notwithstanding the requirement of the Pharmacopoeia that it be neutral? But, were it not acid, the condition of the pharmacopoeial test that sulphuric acid be added in prescribed amount, conduces to the oxidation change. We do not take exception to Prof. Kennedy's statement that calomel in the one case and potassium iodide in the other are oxidized, but

we do object to the assertion that these changes are occasioned by free chlorine and by acetic acid, respectively. We are content to leave the case to the decision of chemists and pharmacists in general.

DISPENSING BY PHYSICIANS, PRESCRIBING BY PHARMACISTS.

There have been numerous attempts before our state legislatures to pass acts allowing physicians full privileges as pharmacists. Druggists and pharmaceutical journals have unitedly protested against such propositions, in the majority of instances with success. There are some states, however, which allow physicians to register as pharmacists without examination, simply through virtue of their possession of diplomas as physicians. The question obtrudes, why should or should not the physician be allowed the privileges of a pharmacist? Does a medical training include experience which fits one for the duties of pharmacy? We think he who knows what is the training of both the pharmacist and the physician will assert with emphasis that the course of study prescribed for either does not include the branches of learning which will fit him for the duties of the other calling. The physician in his college course masters many branches which never enter into the studies of the pharmacist, and vice versa. The doctor gives but little attention to materia medica and chemistry, his studies being devoted to the mastery of the mysteries of the human body and to the acquirement of facility in correct diagnosis. The pharmacist, on the contrary, makes chemistry and materia medica his principal studies, being impressed with the necessity of familiarizing himself with the natural history, therapeutic uses and incompatibilities of drugs. As a result of this condition of affairs a contemporary very aptly says that when the two meet professionally the pharmacist gets to sound only the shallowest depths of the physician's learning, while the physician beholds the pharmacist at his best. We make the statement with all belief in its soundness and truth that the physician is not a competent pharmacist and the druggist is not the possessor of sufficient medical knowledge to qualify him for prescribing, and when the doctor wishes to compound medicines and the druggist desires to prescribe for the sick, each is encroaching unduly upon the professional privileges and domain of the other.

RED CROSS AS A TRADE-MARK.

On account of its attractive and artistic qualities many manufacturers of this country have adopted and have been using for years trade marks whose distinctive features are a red cross. It will be remembered that in 1864 nearly forty nations, including the United States, agreed upon a treaty which had for its aim the mitigation of the evils of war by providing for the use of a red Greek cross upon a white background to be displayed upon the persons of the members, appliances, buildings, etc., of the Red Cross Society. It is claimed that the use of this insignia by private parties is a serious embarrassment to the military forces of the country during a time of war. To obviate these difficulties there has been passed in the house of representatives a bill (No. 5580) which has already reached the sen-

ate and been referred to the committee on foreign relations. As there is a possibility that the legislation may affect some drug manufacturing firms we give the text of the bill below:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that from and after the passage of this act it shall be unlawful, except as hereafter described, for any person or association of persons within the jurisdiction of the United States or of any territory, to give, sell, distribute, or display the symbol of the red cross heretofore designated, or any colorable imitation or semblance thereof, or to use the same, or to use the same, or as a designation or part of a designation the words "red cross," or any expression liable to be mistaken therefor; that every one not directly connected with the American National Red Cross or without special permission granted by the central committee of the Red Cross is hereby forbidden to use, or to use, or to wear, or to use, or in any way displaying the sign of the Red Cross, heretofore described, or in anything liable to be mistaken for such name and insignia, and any person so offending shall be deemed guilty of misdemeanor, and upon conviction thereof shall be punished for each and every offense by a fine of not less than fifty dollars, or more than five hundred dollars, or by imprisonment for a term not exceeding six months, or by both such fine and imprisonment; the fine so collected shall be paid to the American National Red Cross to be used by it as it shall consider the best interests of said organization. All persons who have adopted or used the red cross as a trade mark shall, within one year after the passage of this act, discontinue the use of the same or be liable to a fine of not less than fifty dollars or more than five hundred dollars and confiscation of said articles of whatever description, unless the central committee of the American National Red Cross gives them special written permission to do so for which privilege a consideration of not less than five hundred dollars shall be paid to the said committee; all fines, consideration of money, and articles of value shall be turned over to the American National Red Cross to be used as it considers appropriate. Any person or persons not directly connected or authorized by the American National Red Cross making or attempting to make collections of money or goods for or in the name of the red cross shall be liable to a fine of not less than five or more than one hundred dollars or imprisonment for a term not exceeding one year: Provided, however, that this section shall not be held to apply to the officers or agents of the United States of America especially authorized by law to use the name and such officers and agents of the said organization as may be designated to aid in the work for which such organization was incorporated under the Government of the United States; and, second, to the agents of any foreign State acting with the knowledge and consent of the Government thereof and of the President of the United States first mentioned and obtained: Provided, that this section shall not apply to secret organizations such as the Knights Templar, Masons, or the badge of the Sixth Corps of the Army, who adopted a red cross in the Order of the Twelve on the second day of August, eighteen hundred and sixty-four.

The drug store loafer is a common nuisance. He is described, by one who has met him, as too mean to go out with the boys, too lazy to stay within his own domestic circle and entertain his wife. He loafs around the drug store, buys a cheap cigar and scents the entire neighborhood with its vile fumes. He evidently takes delight in his skill as an expiator, as evidences thereof are to be seen in all directions. A word of advice to all druggists afflicted with this unbearable bore, kick him out. You lose his cheap and scanty custom, but you gain in the esteem of your more respectable patrons, whose approbation and recommendation will bring you good returns.

A druggist who has no license to sell spirituous liquors cannot knowingly sell them for use as a beverage, even after they are compounded with other ingredients into medicines; and where the evidence clearly shows that he must have known the purchasers bought them for consumption as a beverage, and for the sake of their intoxicating property, it was not reversible error for the court to charge the jury that "the party selling must use an ordinary degree of caution and diligence in ascertaining for what purpose they (the medicines) are wanted." Davis vs. State, Supreme Court of Georgia, 18 S. E. Rep. 998.

The Michigan State Agricultural College has been looking into the question whether there is danger in the use of poisonous sprays upon fruits. The experiments cover two years, and the results show that appreciable quantities of the poisonous salts remain in the ripened fruit, though the amount is small. Most of the poison remains on the outside, but a part finds its way into the substance, and the report recommends that during the period of ripening no fruit should be sprayed with solution of mineral salts. It farther says that the amount of poison used is generally largely in excess of what is necessary, one-third the customary quantity would probably give as good results.

[Written for the Era.]

EXPANSION AND SPECIFIC GRAVITY OF WATER REFERRED TO 15° C. AS NORMAL TEMPERATURE.

By Dr. Chas. O. Curtman, St. Louis.

Water is in its state of greatest density at 4° C., and hence this degree has been generally assumed by physicians as the norm for comparison of volume with other liquids of the same temperature, or, in other words, for determining the specific gravity of liquids with water as a unit. The measuring of volumes occupied by liquids, and the graduation of vessels for this purpose has also been referred to this temperature as a norm. But, as every one knows, it is by no means agreeable to do such work at 4° C., and hence the practice has long since departed from the conditions prescribed on theoretical grounds, and a somewhat higher temperature has been chosen as norm for the graduation of volumetric and areometric instruments. After various oscillations in the temperature to be used, that of 15° C. has, by general consent, gained the preponderance and in conformity with this usage, the U. S. Pharmacopoeia has made this temperature the basis for its volumetric assays and for the tables of specific gravity. From this alcohol alone makes an exception, 15.555° C. (60° F.) being retained on account of its being adopted for that article by the United States custom house. For the purpose of facilitating calculations for reducing volume and specific gravity to a normal temperature of 15° C., the following little table has been prepared. It is absolutely correct for pure water only, but may serve very well for all kinds of aqueous solutions, volumetric reagents, urine, etc., as their expansion and contraction, and therefore their specific gravity, are almost absolutely proportional to those of pure water at the same temperatures. Hence corrections may be easily made in measurement of such liquids at other temper-

atures than that at which the instruments have been graduated.

Thus, the volume of 1,000 cubic centimeters of water measured at 15° C. expands at 25° C. to 1,002.045 cubic centigrams, and therefore a volume measured at 25° C. must be divided by 1.002045 to give the correct reading for 15° C.

The specific gravity of 1.020 indicated by the urinometer at 25° C. must be divided by 0.978558, as given in the table, to obtain the specific gravity of the urine at 15° C., which results in 1.022. To obtain the specific gravity or volume which aqueous liquids measured at 15° C. would assume at other temperatures, the amount must be multiplied by the figures of the table. To reduce the specific gravity or volume of such liquids, measured at different temperatures, to that at 15° C., the amount must be divided by the figures of the table.

Volume and specific gravity of water at different temperatures compared with water at 15° C. equals 1.000000.

detailed particulars of the work of the various sections of the coming Congress of Applied Chemistry, at Brussels, are:—

In the section of agricultural chemistry the chief points to be carefully studied and discussed are: 1. The estimation of nitrogen, both in the form of ammonia and nitric acid, in manures, etc. 2. The estimation of phosphoric acid in soils, with especial reference to the proportions of soluble and insoluble phosphates and the use of ammonia citrate as a solvent, both in manures (superphosphates) and soils. 3. The estimation of iron and alumina in phosphates. 4. The analysis of commercial fertilizers.

In the section of public health, the purity of butter, the melting points of fatty bodies, the analysis of pepper and the bacteriological examination of water are the chief points to which attention is to be paid. The importance of determining a standard method for taking melting points is very great.

In the section of biological chemistry the chief work will be the publication of a review of applied biological chemistry in several languages. In addition to this, the cultivation of pure yeasts for fermentations, and the relations of oxygenations to this, vinegar ferments, grain and molasses are to be dealt with in detail. The total result of the congress should be of some importance, since it has the desirable object of the unification of analytical processes in view.

[Written for the Era.]

THE COAL-TAR COLORS IN THEIR SANITARY RELATIONS.

By Henry Leffmann, M. D., Professor of Chemistry and Toxicology in the Woman's Medical College of Pennsylvania.

Nothing illustrates more vividly the value of painstaking investigation than the history of the utilization of coal-tar. Originally a refuse product of most objectionable character, the disposal of which was one of the most difficult tasks in gas engineering, it has become of the greatest importance, and even if the operation of distilling coal for gas should cease, the manufacture of tar and other accessory products of gasmaking would continue. Vast industries, involving millions of capital and employing an army of skilled and unskilled workmen, have been founded on the use of the derivatives of this product. The chemistry of coal-tar demonstrates the great value of abstract reasoning. A large part of the substantial progress in this field has been due to close attention to the theories of structure and to ingenious suggestions as to molecular arrangement.

While all civilized nations have contributed to the study of this topic, it is to the Germans that we owe its largest individual contributors, and the patient inquiry needed for the work has, of course, been best supplied by them. The result is, to use the language of Prof. Eugene Sell, that "the coal-tar color industry of Germany has conquered the world, and will be able to maintain its pre-eminent position."

Most persons know little else about coal-tar except that colors are made from it, and the general information is quite vague, a not uncommon opinion being that the colors are extracted from the crude product—that is, pre-exist in it. In reality, a long line of transformations is needed to secure the products now commercially known.

In discussing the sanitary relations of these bodies, it will not be amiss to explain briefly some theoretical and practical points. The tarry products of the destructive distillation of coal are complex, being intimate mixtures of many compounds, principally hydrocarbons. Different coals give tars of different composition. In the manufacture of colors and other derivatives, only approximate separations of the hydrocarbons are made, and some variations in the composition of the finished material will result; hence, products nominally the same, but from different factories, will not be exactly identical. This has brought about a system of nomenclature, especially with colors, the initials of the manufacturers being used. This gives precision in the indication of a color, a matter of importance not only in trade but in the employment of these articles in tests and staining fluids.

The most important ingredient of coal-tar is benzene C_6H_6 . This must not be confounded with a coal-oil product, benzoin or benzine, which is a mixture of several hydrocarbons of a type entirely different from benzene. Benzene may be obtained perfectly pure, and is then a colorless, limpid, volatile liquid, with a characteristic "coal-gas" odor. It burns readily, giving much smoke. It solidifies by moderate cold. The pure article is not used for making colors; indeed, for many such operations it is inapplicable and the crude forms are needed. These are usually brownish liquids and contain moderate

amounts of hydrocarbons, similar in structure to benzene and "homologous" with it, that is, differing in composition by some multiple of the ratio CH_2 . Toluene C_7H_8 , (i. e. $C_6H_5 + CH_3$), and xylene C_8H_{10} ($C_6H_4 + 2CH_3$) are usually present. It is usual to call crude benzene "benzol," and while such a name is objectionable in view of the now generally accepted agreement among chemists to regard the termination "ol" as indicative of alcoholic structure, yet it is not likely that trade interests will abandon the use of the term. In this connection, I must express my regret that, in the preface to the last edition of the Pharmacopœia, encouragement has been given to the use of benzol as a name for benzene itself.

The crude benzene is converted by the action of nitric acid into nitro-derivatives, and these by further action are converted into bodies containing the group NH_2 , and called amido-derivatives. Benzene itself, by these transformations, yields aniline (amido-benzene) $C_6H_5NH_2$; the associated hydrocarbons yield analogous bodies. From the mixtures of these amido-compounds many brilliant colors may be obtained, and although the progress of invention and discovery has brought about the use of colors not derived from aniline or its immediate congeners, yet the coal-tar dyes are still collectively known in general literature as "anilin colors."

Theory would lead us to expect that all such derivatives would be poisonous. Both nitro-benzene and aniline are highly poisonous, but fortunately most of their commercial derivatives are without marked toxic action. Much misunderstanding has long existed on this point. In some cases the poisonous character has been gratuitously assumed, but in others an injurious action has actually been noted and afterwards found to be due to impurities. This latter was the case with aniline red (magenta or fuchsin). There is no longer any reason to regard this color as poisonous. It was, however, at first, and probably even now, made by the use of arsenic acid, and an appreciable amount of some arsenical body remained in it, conferring high toxic powers. When freed from this impurity, or prepared by non-arsenical methods, it is harmless. In one class of colors supposed to be the cause of skin irritation with those working in them, it was found that the strong bleaching agents used for cleansing the skin were the cause of the trouble. One point in favor of the aniline colors is that they are mostly so high in coloring power that they are not likely to be swallowed unawares, and need only be used in food and drink in very small amounts. Thus, I am informed by a manufacturing confectioner, who exercises great care in the selection of the colors he uses, that a yellow color, "auramin," has such power that one ounce will color two thousand pounds of candy. Obviously, a body would have to be highly toxic to be felt in such dilution. Moreover, the pure coal-tar colors are not likely to be cumulative, that is, repeated small doses are not likely to give rise to chronic poisoning, since, being complex organic molecules, they are easily broken up in the system and excreted.

Dangerous effects of the artificial colors made arise in three ways:

1. Actual toxic action of the color.
2. Presence of poisonous impurities, either (a) from use of such substances during manufacture, or (b) from liability to adulteration.

3. Employment of the color to conceal substitution or adulteration of food products.

As to the first class, I have already said that few of these colors are decidedly toxic, even when pure. Some of the yellows are dangerous, especially those containing the group NO_2 (nitro-compounds) among which is to be noted Martius' yellow-di-nitro-alpha-naphthol. This is a cheap and useful yellow, and there is a constant liability to employ it. Picric acid and anilin orange (di-nitro-cresol) are also poisonous. The latter is also known as "safron substitute," and an interesting case occurred some years ago in Bremerhaven, in which a woman desiring to produce abortion obtained and swallowed safron-substitute instead of safron (*Crocus sativus*), not knowing the mistake. She died from the dose. Weyl, to whom we owe the most exact and extended information on these questions, gives the following as poisonous colors, in addition to those noted above: Methylene blue, safranin, orange II., and metonil yellow. Fast brown G. and Bismarck brown have slight irritant action, but can scarcely be regarded as poisonous. Many colors have not yet been tried, still the proportion of dangerous ones is certainly small.

Concerning the liability of coal-tar colors to contain poisonous impurities, it may be said that there is some cause for anxiety. Arsenical compounds are, of course, the most dangerous of all, and aniline red, which is still a popular color, is often made by the use of arsenic acid. Some coal-tar colors are found in the market in combination with metallic chlorides, such as zinc chlorid. Others again have impurities derived apparently from the vessels in which they are made; thus, I have rarely failed to find slight amounts of copper in Bismarck brown, also zinc in small quantities in other colors. It is advisable, therefore, that all colors intended to be used in food (and such use in candies at least is legitimate) should be tested for metallic impurities. An unfortunate circumstance in regard to the coal-tar products is that the names, being mostly fanciful, are no guide to composition, nor even identity. A change may be made in the nature of the color, or a substitution of a cheaper color occur, and if no visible change is produced the substitute may be constantly sold for the original. In this way the low-priced Martius' yellow, which is poisonous, is said to be substituted for naphthol yellow S., which is non-poisonous.

The presence of arsenic, antimony or mercury in a color may be easily ascertained by Reinsch's test; the presence of copper, lead, zinc or tin, by burning off the color in a porcelain crucible and testing the results according to the usual system of qualitative analysis.

Much attention has been given to supposed irritant effects of coal-tar colors on the skin. I have seen very little evidence of this. Some suspicion attaches to safranin, but nothing absolutely demonstrative. Arsenic as an impurity has been charged with causing trouble in dyed underclothing, but theory would indicate, and experiments I made some years ago seemed to confirm this, that an arsenical compound in the dye stuff remains in the vat-liquor and does not pass into the yarn. I have long been of the opinion that much of the skin irritation ascribed to dye-stuffs is due to the use of irritating soaps.

The third class of injurious effects of the coal-tar colors, namely, the fact that they enable impure, weak or substitute foods to be imposed upon the public, is, of course, an indirect influence, but it is not unworthy of attention. A yellow color, harmless in itself, may be used to avoid the use of eggs, or, by its means, a watered milk may be made to appear rich. A plain fat may be given the appearance of butter; a mixture of corn starch and a little anilin red may make an apparently rich pudding. The coloring of wines and similar beverages is well known. Raspberry syrup quite innocent of the luacious fruit may be easily prepared by the use of the same color. But little legislation is yet in force in the United States on this phase of adulteration. It will be well to state that as far as butter and milk colors are concerned, and they are largely used, annatto, which is a natural vegetable color, is mostly employed.

The fact that colors nominally the same are often not exactly identical by reason of the slight differences in the crude products from which they are prepared, has been noted above. Moreover, many colors are obtained by secret or patented processes, and hence the exclusive products of certain houses. Initials denoting the place of manufacture are often attached to such colors. Among those of common occurrence are:

M., L. & B.—Melster, Luclus & Bruning.
B., S. & S.—Brook, Simpson & Spiller.
B., A. S. F.—Badische Anilin & Soda Fabrik.

Initials are also used to indicate differences in shade and modification in composition. There seems to be no great unanimity in method in this respect. The hostile feelings existing between the French and Germans have tended to prevent a common system. Different shades of the same color are indicated by the initial of the tint by which the color is influenced. A red color, for instance, may be produced with varying shades of blue, and these will be indicated by B., BB., 3B., etc., according to the degree. Similarly, "Eosin J." means a yellow shade of eosin (Fr. jaune, yellow). Tropaeolin OOO indicates a strongly orange shade of the color.

Chemical change may also be indicated by letters. Naphthol yellow, by treatment with sulfuric acid, becomes changed by taking the molecule HSO_3 , and this is technically called "sulfonation." The modified color so produced is called naphthol yellow S. It is worthy of note that sulfonation seems to diminish the poisonous action of a color, although rendering it more soluble.

It has been noted that, although comprehensively called "anilin" colors, many coal-tar dyes are not derived from this body, but from other ingredients of the tar. Among these are prominently naphthalene and anthracene, which yield many very valuable derivatives. The same principles, however, as to nomenclature, effects and uses apply to these as to the true anilins. The introduction of new colors goes on with great rapidity. Dealers may give no notice of such substitution, and thus harm may be done, for it is very rare, if ever, that a manufacturer ascertains the effects of his product on the animal system.

SANITARY CHEMISTRY.

By Victor C. Vaughan, Ph. D., M. D., Dean of Medical Department, University of Michigan.

Much has been said in recent years of the work which should be done in sanitary science by the chemist. Many municipal and a few State Boards of Health regularly employ chemists. It may not be out of place to make a few statements concerning the need of such employment and the work which these chemists should be called upon to do.

Boards of Health are created and supported for the purpose of preventing sickness and death. We now know that about eighty per cent of the deaths occurring annually are from preventable causes. Pains to man's health and happiness are all about us. They float in the water we drink, they feed on the food we eat, and they contaminate the air which we breathe. It is the duty of boards of health to detect the presence of these dangers, to remove them when possible, and to warn the public when desirable. Much can be done in all of these directions by a board supplied with scientific experts whose entire time should be devoted to the work.

In the first place, the sanitary chemist must be more than a chemist, he must be a bacteriologist as well. Some one may ask why the work of the chemist and that of the bacteriologist should not be divided and an expert in each branch employed. To this it may be answered, divide the work as much as you please, employ as many persons as may be needed. Too little money is given to our boards of health. The number of experts at their command is too small. The safety of the people should always be the supreme law and is worthy of first consideration. We have no foreign foe who could possibly inflict upon us the injury, suffering and death which typhoid fever will cause during the next twelve months. We need an army of scientific experts to protect the people from disease and death. However, the man who undertakes to do the chemical work which should be carried out daily by every board of health in our larger cities will fail unless he be a bacteriologist as well as a chemist. Pathogenic germs are only chemical poisons which are capable of indefinite growth and multiplication and the most deadly chemical poisons are the products of bacterial activity. The man who studies these poisons successfully must know them in both conditions, their living and their dead forms. With this hasty introduction, I will proceed to mention some of the lines of work which the chemist in the employ of a municipal board of health should, in my opinion, carry out.

About fifty thousand persons die annually in the United States from typhoid fever and more than ten times this number are sick with this disease. The greater number of these cases are due to the drinking of infected water. For these reasons the public water supply of a city should be most zealously guarded. The reward which comes from this care is greater than that afforded by riches. It consists of health and happiness. The chemist should make weekly and at certain seasons of the year daily examinations of the drinking water. The typhoid germ can be quite easily detected and it should be recognized at its first appear-

ance in the water. The chemist should not wait until there are cases of typhoid fever before he looks for the germs in the water supply, but he should detect the germs before there is an epidemic of the disease, or, better still, he should guard the water that the admission of such germs becomes impossible. In case of infection of the water supply, the board of health should immediately warn and advise the public. Suppose that a city takes its drinking water from a river which flows through a populous country. Cities and villages, manufactories and farm houses are constantly pouring their waste into the river, either directly or indirectly through its tributaries. The composition of the water supplied to this city varies from day to day and the chemist should watch these variations as the mariner watches wind and cloud. The water may be perfectly safe to-day, and to-night a rainfall may wash the typhoid-laden accumulations from the privy-vault of a farmer into the river, and to-morrow the water may contain a most virulent poison. I think, therefore, that I cannot be accused of exaggeration when I say that the public water supply of every city should be examined at least once a week. In certain instances these examinations should be made even more frequently. Since I desire to make this paper as practical as possible, I will mention some of the conditions which, in my opinion, demand very frequent examination of the water supply. In doing this I will again suppose the city is taking its water supply from a river flowing through a populous country above the city. In such a case the following are, in my opinion, conditions which should justify very frequent examinations:

First—The known existence of typhoid fever or any other water-borne disease in any of the districts drained by this river or its tributaries above the city. Had the authorities at Grand Forks, North Dakota, had their water supply examined daily as soon as they learned that typhoid fever was prevalent at places located above them on the river from which they were taking their water supply, much sickness might have been prevented and many lives might have been saved, and the city would not have had the sad experience it has been having for the past few months. This is equally true of many other places which could be mentioned.

Second—The known contamination of the river with any sewage, even when such sewage is not known to contain any specific infection, within a distance of forty miles of the intake of the water supply. In some cities the authorities have shown their deplorable, and I might add criminal, ignorance of sanitation by contaminating their water supply with their own sewage. They have done worse than the fabled bird which befouled its own nest; they have polluted their own drinking cup.

Third—The presence of an unusual number of people on the river or body of water from which the water supply is taken. There are many cases of walking typhoid fever and any one of these may contaminate the water supply. Moreover, it is altogether probable that many people become immune to this disease, and the germ may exist in the excretions of these persons, who are not only free from the disease, but in perfect health.

In the second place, the sanitary chemist must give much time, attention and skill to the milk supply. It cannot be denied that milk and water are the two deadly drinks. More than one-fourth of the children born to the civilized world die before they reach five years of age. A large per cent of the diseases with which these children are afflicted come from the milk which they drink. Many saprophytic germs produce chemical poisons by their growth in milk. These poisons induce the summer diarrhoeas which cause the fearful infantile mortality in our large cities during the hot months of summer. The bacteriologist cannot distinguish these germs from those which are harmless. The chemist must be able to detect the chemical poisons. At the same time he must be enough of a bacteriologist to make and to carry out rules for the control of the milk supply. Some of the poisons which are formed in milk by these saprophytic germs are basic in character and belong to that class of putrefactive products designated as ptomaines, while others are albuminous bodies and resemble in their deadly action the venom of poisonous reptiles. It is not adulterated milk or diluted milk that causes this high death-rate—it is polluted milk. Besides these saprophytic germs, certain specific micro-organisms may be present in milk. Among these we may mention the germs of tuberculosis, diphtheria, scarlet fever and typhoid fever. The typhoid germs are most probably introduced into the milk in the majority of instances with water which is used in diluting the milk. The tubercle germs may come from using the milk of tuberculous animals or from the infection from tuberculous milkers or other persons engaged in the care or transportation of milk. The diphtheria and scarlet fever germs often find their way into milk from persons who are recovering from these diseases. Epidemics of all of these specific diseases may frequently be traced to the milkman. By careful attention to the milk supply of a large city, many hundreds of lives may be saved annually.

Attention to poisonous milk is of more importance than estimations of the amount of fat or other constituents. However, the last mentioned work is not without its value. Many children are wholly dependent upon milk for their daily food. If this milk is diluted, the child may literally starve to death. This is the reason why municipal authorities frequently forbid positively the sale of diluted or adulterated milk. This prohibition is certainly a just one. The parents should not be allowed, even if they desire, to feed their children upon a food which is not sufficiently nutritious.

Probably next in importance to the water and milk supply, the chemist should give his attention to the public markets, and especially to the meat supply. Meat may be the bearer of infection and the cause of disease in the following cases: First, when the animal from which it has been derived is diseased. It is a well-known fact that anthrax, tuberculosis and other specific diseases may be transmitted to man by the eating of the flesh of diseased animals. Second, the meat may become infected by the person handling it. Tuberculous persons should not be allowed as employees in meat markets. The dust of rooms occupied by tuberculous persons becomes infected with the

specific poison and this may settle on pieces of meat which are sold and consumed, and may cause disease. Third, even the flesh of healthy animals may undergo putrefactive changes in which a whole class of chemical poisons is formed. Among these poisons are some which are most deadly. This explains why sickness so frequently follows the consumption of canned meats. In the process of canning, the contents of the can are not completely sterilized and the meat undergoes a slow putrefaction by the formation of these highly virulent poisons. The chemist should be able to isolate these poisons and to demonstrate their action upon small animals.

In addition to his work on food and drink, the sanitary chemist must be able to detect impurities in the atmosphere and to recognize the presence of sewer gas and other contaminations. Certainly the amount of work which the sanitary chemist in the employ of a municipal board of health may be called upon to do is unlimited. Unfortunately, the public generally does not at present appreciate the great saving of life which might be accomplished by these means. However, the time will come when we will spend quite as much money, time and energy in combating disease as we do in protecting our country against foreign foes.

HOW TO STUDY TO SUCCESSFULLY PASS THE STATE BOARD EXAMINATION.

By Harry B. Mason, Ph. G.

It is the earnest desire of every apprentice in the store who is unable to go through college, to so conduct his studies that he may successfully pass the State Board examination and become a "registered" pharmacist.

The state laws now require an apprenticeship of four years before the student can be allowed an examination. If these four years of apprenticeship, preceded by a substantial preliminary education, are used to his best advantage, with the hope of reward spurring him on, and the desire to become registered at the end of his apprenticeship, there is no reason why the student should not successfully and ably pass any State Board examination. But he must remember that only hard and diligent work will carry him through, for the examinations are increasing in severity each year, and only the fittest and those most capable of pursuing their profession ably are recognized.

To that desired end I suggest to you a course of study which shall consume but two years of your apprenticeship, and which, if thoroughly understood, will enable you to pass any State Board examination. You should, of course, follow this by further study and research. There are three main branches in the study of pharmacy, and though these are again divided into numerous subdivisions, some of which belong strictly to a college course and not actually necessary for study preparatory to State Board requirements, I will treat them together under each head, suggesting the text books needed for each and the time necessary for their study.

PHARMACY—First year: Remington's Pharmacy to Part III. and including pages 1081 to 1153.

Second year: Heebner's Manual of Pharmacy, beginning at Part II. and completing the book, using meanwhile Remington for general and explan-

atory reading, and the Pharmacopoeia for reference; reserving four weeks at the end for Hartt's Volumetric Analysis.

CHEMISTRY—First year: Steele's Physics entire, first fifteen weeks; Fowne's Chemistry, pages 131 to 274, remaining thirty-five weeks.

Second year: Clarke's Chemistry, beginning with the metals on page 172, and completing the book, using Fowne for general and explanatory reading.

BOTANY, MATERIA MEDICA AND PHARMACOGNOSY—First year: Completion of Gray's Lessons in Botany.

Second year: Maisch's Organic Materia Medica, using the Dispensatory continually as a reading reference.

FIRST YEAR'S STUDY—Take Remington's Pharmacy and divide its 436 pages preceding Part III. and its 72 pages in the back between pages 1081 and 1153, making 508 pages in all, into 50 divisions, each division having a like number of pages, and mark them for future reference. Use each division thus marked for one week's study and consider as one lesson or lecture, following your studies with practical experiments in specific gravity and pharmaceutical manipulations as far as possible.

In chemistry begin with Steele's Physics and go through the book, devoting fifteen weeks to its study and dividing it into fifteen divisions. An understanding of the laws of natural philosophy is necessary for the proper study and comprehension of the science of chemistry, as a preliminary to it. Follow this fifteen weeks' study of physics, by devoting the remaining thirty-five weeks of the year to Fowne's Chemistry, using only pages 131 to 274, giving special attention at the end of the year to "Atomic Weights," "The Atomic Theory" and "Chemical Affinity," and to the study and writing of reactions, for upon this depends much of your success in the study of chemistry.

As for your first year's study in botany, I have only to say that you should go through Gray's Lessons, which you will find easy in comparison with chemistry or even pharmacy, dividing each week as with the other branches.

SECOND YEAR'S STUDY—You have but little more than learned to study during your first year, and in your second will be compelled to use your memory to good advantage.

For your study of pharmacy, begin with Part II. of Heebner's Manual, and divide the remainder into forty-five divisions, reserving the remaining five for Hartt's Volumetric Analysis. In this connection, as things are too condensed or difficult, use your Remington to help you out. It is a good way to read Remington first, asking yourself questions from Heebner, and study Heebner afterward. Use the Pharmacopoeia for tests, etc., which apply during your study, for they will further your understanding and knowledge of the subjects under consideration, and enable you to remember them much better. In your study of Hartt's Volumetric Analysis I would advise your making up some normal solutions and applying the tests personally, for you will the better understand it.

Your second year's chemistry will prove hard and difficult to you, but you will master it by proper study. Begin with a study of the metals in Clarke's Chemistry (page 172) and finish with the study of organic chemistry, dividing the 177 pages thus covered into fifty divisions. In con-

nection with your study of the metals, find four or five tests for each in Heebner or Remington, and apply them, writing the reactions to your satisfaction; this is essential, for you will be called upon to give tests and write reactions. If the mysteries of organic chemistry appear difficult of comprehension, refer to Fowne for fuller explanation and detail. In fact, it is better to study both, taking your lessons from Clarke.

As for second year botany and materia medica you will find that a good memory is an essential, and that a thorough training of it is necessary. Use Malsch as a text book, dividing its pages into fifty divisions. Reference to the Dispensatory will often be necessary, as it is much more complete. You will need to learn the habitat, origin, main constituent, medicinal properties and dose of each drug under consideration, and from practical experience with them, the description of those that you have or can secure, which constitute pharmacognosy. The purchasing of a cabinet of crude drugs is advisable, though not necessary. You should give considerable attention to the recognition of crude drugs and their adulterations, so as to be able to distinguish them when adulterated, but do not try to remember "book descriptions," for you are only wasting your time. Neither learn any natural orders, for it is unnecessary.

You have thus three lessons each week and can give up two days to the study of each, interspersing with practical experiments as you go along. Study as you would if you were at school and had regular recitations and monthly examinations to pass. Don't read the matter over, but study it, memorize it and test your knowledge by asking yourself questions, which you will find in Clarke or Remington, and which, if not given, you can form for yourself. You have an average of only three to six pages of matter to a lesson and two days in which to study it. There is ample time, if properly used, to study thoroughly every point, and you will find that if you are thorough, you will remember them all easily when reviewed. After learning the present lesson review the last one in each case, so that each week you will be reviewing one week back. Use every spare minute you have to advantage, as though you were preparing for regular quizzes. You would if you were at college and you must if you expect to be successful. By asking yourself questions you can soon judge whether you have learned your lesson or not, and if not, do not stop until you have. Every three months give up a week to general reviewing of all the main points gone over, omitting the general weekly lessons for the time being, and see that you are well posted on ground already covered. It is better to go slow and comprehend as you go along. A thing once learned has but to be reviewed to bring it back forcibly to the mind.

At the end of the first year, give up two or even three weeks to a thorough review, and more if necessary, until you feel that you know every point of importance you have studied.

Pursue the same diligence and self-quizzing throughout the second year, have the same quarterly reviews, and at the end thoroughly review both years.

If you are then able to tell the substance of what you have gone over, you need fear no State Board examination. While you have not gone over all you

would go through in a regularly prescribed college course in these subjects, to say nothing of branches you have not touched, you have learned that which applies directly or indirectly to a State Board examination, and more which will be of much practical interest to you. It is said, with much more truth than fiction, that one cannot hope to pass the State Board at this day unless he go through college. But if you have diligently pursued the course herein prescribed, you have taken that from a college course which will help you through a State Board examination. But you should widen your scope and pursue your studies farther. There are many things which you can take up with advantage, even if you are "registered," among which is a study of "Urinary Analyses," which truly belongs to the pharmacist, milk analysis and analysis in general. Do not think your study is completed because you are registered, but continue your research indefatigably for the benefit of mankind, your own reputation, and the furtherance of your profession.

[Written for the Era.]

PHARMACOLOGY—ITS SCOPE AND THE METHODS OF TEACHING IT.

By J. O. Schlotterbeck, Ph. C., B. S., Instructor in Pharmacology and in Botany, in charge of Materia Medica, University of Michigan, School of Pharmacy.

(Continued from Page 346, April 15.)
III.

As was stated in the first part of this article, the microscopical study of plants and their different organs must form a part of pharmacology. The use of the microscope in pharmacy has been so fully and ably discussed in the columns of drug journals that nothing further will be said in this paper upon the subject. Merely an outline of the course of microscopy and the method of teaching it in this school will be attempted.

The botanical and microscopical laboratories, consisting of two distinct working rooms for students, four instructors' rooms, and an herbarium room, are located on the fourth floor of the main building and have a floor area of over 4,000 square feet. Twelve large windows—six on either side—furnish light for the main room, which is the laboratory of microscopy proper. At each window is a large table, specially designed for the purpose, which comfortably accommodates four students working at the same time. In the two rooms there are accommodations for fifty students. Of course there are never that many at work at any one time, since one instructor cannot do justice to more than twenty students. Accordingly all classes are divided into sections of fifteen or twenty.

The laboratory is equipped with thirty-five Leltz compound microscopes, six Zeltz oil-immersion microscopes, twenty dissecting microscopes, polarizers, sliding and rocking microtomes, apparatus for embedding, and numerous other appliances for use in elementary plant physiology and advanced work in pharmaceutical microscopy. All that portion of the general library which applies especially to botany is placed in this laboratory for the convenience of the students. An herbarium of over eighty thousand specimens is accessible to the students and is also conveniently located upon the same floor.

The floor plan of the two laboratories is given below:

A.—Aquaria.
T.—Work-table at each window.
W.—Window.
G.—Garden window.
Cl.—Classroom.
R.—Reagent case.
M.—Microscope case.
L.—Library.
H.—Herbarium.
Ins. R.—Instructor's room.
Prof. R.—Professor's room.

Perhaps the programme of work is about the same as in most other schools which give a course in microscopy, and the ground covered during the semester may be no greater or indeed not so great as in these schools. That is, more drugs and sections of plant tissues may be examined in other schools, and especially if ready-made mounts are furnished for study, but here, as was stated before, students are taught how to use the microscope intelligently and to get the most out of it. As a result not as many subjects are studied, but the student becomes thoroughly acquainted with the method of microscopy and is competent to pursue his work to any extent he desires.

The synopsis of work is essentially like that given in the first few pages of Power's translation of Flueckiger's Principles of Pharmacognosy. After having finished the study of starches, however, practical work in the detection of adulterations by starch in the powdered condiments and drugs of the open market is given. Mustard, elm, pepper, cinna-

WORKING TABLE.

mon, hydrastis, rhubarb, insect powder and ginger are among those studied. Having completed the study of the cell-wall in its various forms and modifications and the cell contents in their natural condition, and also under the influence of micro-chemical reagents, some of the typical drugs of the pharmacopoeia are investigated. Some merely in cross-section as a means of identification; others are accorded a minute anatomical or rather histological study.

At the beginning of a new subject each student is supplied with a printed synopsis of directions for study. Each step is followed carefully, descriptions made and copied into note books and sketches made whenever needed to illustrate the descriptions. Great stress is placed upon the importance of the two things. The descriptions are written as the work proceeds, and are to be made so clear and plain that any one not having seen the material under the microscope could form a mental picture of the object from them. All note books are of the same size and are provided with a pocket for the drawings, which are made upon the finest drawing paper cut to uniform size. Twice each semester these books are called in and carefully read over by the instructor, who makes the necessary corrections and comments on the character of the work. The notes will at once show whether the student has obtained the correct conception of the structure of the material he has studied. While the description is perhaps the best indication of the student's ideas, the drawings are no small aid in determining his understanding of the subject.

To be sure it cannot be expected that every one will furnish good drawings, and it is not our intention to make an artist of him. For example, one may not be able to make a good representation of a starch granule like the potato, but if he has noticed the alternate opaque and translucent bands, his sketch will show it, be it ever so inartistic. The advantage to be gained by drawing everything as near like the original as possible, more than warrants the time spent upon it. "Draw everything just exactly as you

see it without anything effective or imaginary," are the directions constantly given. The necessity of insisting upon this may be easily demonstrated by asking a beginner to make a sketch of, say a bean starch grain. The chances are he will draw an oval or bean-shaped outline, without any surface markings whatever. Now tell him to draw a bean granule exactly as he sees it, using the fine adjustment continually to bring into the field of vision the successive portions of the grain. It will have required per-

haps five or ten times as much time as the former operation, but we shall see a hilum and numerous stratifications that run nearly parallel to the circumference.

Until the student realizes the necessity of doing careful work at once, it is no unusual occurrence to request drawings to be made over two or three or even a dozen times. It does not take him long, however, to learn that it saves time to do his very best at the first attempt, consequently there is no relaxation in the earnestness with which the work is pursued.

There are some colleges of pharmacy, even in Germany, where large charts illustrating the very structures the student should work out himself, are hung right before his eyes. Naturally, whatever conception he gets is obtained from those charts rather than from the material under the objective.

Now that kind of work is contrary to sound pedagogical principles and tends to produce copyers or parrot workers rather than fostering independent and original research. He is no more of a scientific man than he who can copy a picture is an artist. Let the student investigate for himself so that when he goes out into the world, he will not be as helpless as a cripple.

An idea of the directions given as a guide to the student's work may be gained from the following outline for the study of aleurone.

ALEURONE.

Material—The seed of *Ricinus communis*.

References—Flueckiger: Principles of Pharmacognosy.
—Strassburger and Hillhouse: Practical Botany.
—Bessey's Botany.
—Sachs' Botany.

CROSS SECTION OF SALIX ALBA.

MICROSCOPICAL LABORATORY.

Define these terms—testa, caruncle, raphe, hilum, endosperm.

I. (a.) Remove the hard shell-like testa of the seed of *Ricinus communis* (castor oil seed) with a pocket knife.

(b.) Make a number of very thin sections with the razor, of the soft tissue of the endosperm and mount them in a drop of strong glycerine. Examine them all with the low power objective and choose the thinnest section.

(c.) Examine carefully for cells, and their contents the aleurone granules. Describe the appearance of the cell-wall; the number of granules in a single cell; their shape, size, position, and the surface markings upon them, if any. Sketch a half dozen or more granules of different sizes and shapes. Then sketch a single cell and its contents.

II. Again cut thin sections and stain with haematoxylin. What effect does it have upon the granule? Find a globoid at one end of the granule. Is it colored by haematoxylin? Describe.

III. Mount several sections in dilute glycerine and examine at once. What change takes place in the appearance of the granule? Are there any structural changes noticed? Describe fully. Sketch a single cell and its contents, taking particular care to accurately represent the crystalloids in their various forms.

IV. Apply dilute iodine solution to a number of thin sections and study the changes produced. Describe the effects produced by the stain and sketch a cell and its contents, showing structural changes produced.

V. Review each step thoroughly and be sure you have a thorough understanding of each before proceeding with the step following.

After having completed the work required during the semester, a special crude drug is assigned to each student to

work out histologically without any help from the instructor. It is strictly an original piece of investigation and decides to a great extent his ability in that line of work. Having completed the microscopical study a complete monograph, including the history, chemistry, pharmacy and microscopy of the drug is presented on thesis paper. This thesis is read and defended before the class in microscopy at the close of the work.

Advanced courses are offered in food and drug adulterations, especially intended to prepare students for work connected with the position of food inspector.

The laboratory is equipped with complete apparatus for work in photo-micrography, which is the most accurate, rapid and satisfactory method of reproducing microscopic mounts. This branch is under the direct supervision of Prof. A. E. Stevens, who has kindly furnished the photograph of a section of *Salix alba* here shown.

(To be continued.)

CALCIUM CARBIDE is an interesting product discovered by Moissan in his work with high temperatures. It is a crystallized compound of calcium and carbon of the formula C_2Ca , and is produced at a temperature in the neighborhood of 3,500 deg. C. He obtains it in reddish-brown shining opaque crystals, which possess very interesting chemical characteristics. His mode of preparing the product and its various peculiarities are found in a contribution to *Compt. Rend.*

A NEW PTOMAINÉ has been discovered in an over ripe cheese made from sheep's milk. Leplierre (*Compt. Rend., Pharm. Jour.*) obtained it in crystalline form, and describes it as inodorous, bitter, somewhat acid, slightly soluble in water and more so in alcohol. Its salts are precipitated by several of the alkaloidal reagents, but not by tannin.

CATHARTIC ACID.—In *Pharm. Ztsch.* (*Pharm. Jour.*) Jenz describes the preparation of this acid by evaporating an infusion of senna in vacuum, mixing the resulting extract with an equal volume of alcohol, stirring well and leaving the mixture to settle for twelve hours. The liquid is then decanted and the deposit shaken again with alcohol and finally filtered. The mixed and filtered liquids are then precipitated with lead acetate, the precipitate thoroughly washed, partially dried, mixed with alcohol and decomposed with hydrogen sulphide. The excess of the gas is driven off by passing a stream of carbonic acid or air through the liquid, then heating the whole in a return condenser, the lead sulphide then being filtered out and washed with alcohol. The clear liquid from this operation is mixed with ether so long as a pale, yellow deposit is produced, which is allowed to settle. The ether is poured off, the deposit washed with ether or strong alcohol, dissolved in a very small quantity of thirty per cent alcohol, and evaporated at a temperature not exceeding 50 deg. C. The cathartic acid so obtained has the characteristics of a glucoside and amounts to from 0.6 to .75 per cent. It is soluble in hot water and alcohol, is expressed by the formula $C_{20}H_{12}NO_{12}$, and is given in 0.1 to .15 gram doses.

EXALGIN FOR HYPODERMIC USE.—To obviate the objection attaching to the use of this drug because of its sparing solubility, Cesaris recommends the following combination:

Exalgin.....	.1 part
Sodium Salicylate.....	.1 parts
Distilled Water.....	.10 parts

E. B. HALLIDAY, Acton, Ind.—The Era is valuable from cover to cover, and the only way I know to improve it is to give us more of the same if it could possibly be done for the money.

FORMULARY AND QUESTION BOX.

The object of this department is to furnish our subscribers with reliable and tried formulas and to discuss questions relating to practical pharmacy, prescription work, dispensing difficulties, etc.
Requests for information are not acknowledged by mail and ANONYMOUS COMMUNICATIONS RECEIVE NO ATTENTION. To insure answer in the next number, queries should be in our hands *ten days* prior to the date of issue.

6030. Elixir of Pyrophosphate of Iron, Quinine and Strych-nine.

(A. R.) A. Rosenwald, of Chicago, commenting upon the answer to this query presented in our March 15th issue, says the formula which he employs is:

Sulphate of quinine..	64 grains.
Citric acid.....	10 grains.
Pyrophosphate of iron	128 grains.
Water of ammonia...	20 to 30 drops.
Water	1 ounce.
Simple elixir	15 ounces.
Sulphate of strych-nine	2 grains.

A formula by Haussman and contributed to the Era directs trituration of 1 grain of strychnine and 64 grains of quinine sulphate with 5 grains of citric acid until thoroughly mixed. The whole to be then rubbed up with 3 fluid ounces of alcohol gradually added. Then heat 6 fluid ounces of syrup to about 150° F. and add to the alcoholic mixture and stir until clear. Dissolve 256 grains of iron pyrophosphate in 4 ounces of water with heat, if necessary, and add 3 fluid ounces of orange flower water. The two solutions are then mixed, and, when cold, just enough sodium bicarbonate in solution is added to make it neutral in reaction. Allow to stand a few hours and filter through white paper. The precipitation which is sometimes observed in mixtures of this character is supposed to be due to lack of care in regulating the temperature at which the alcoholic and aqueous solutions are mixed. This should not rise above 140° to 150° F., as above this point too much alcohol is evaporated, and then the precipitate forms.

6125. Hair Curling Liquid.

(J. F.) A number of formulas were presented on page 44 of the Era for January 15, 1892.

6126. Palatable Cod Liver Oil.

(W. W. P.) See Era of January 15th, 1894, page 61, query No. 5905. Also see last issue (April 15), page 369.

6127. French Developer.

(R. & P.) We are unable to answer your query, as you give us no collateral information to assist us in our search.

6128. Papine.

(Student.) This is a proprietary preparation whose exact composition is maintained a secret. A formula, which, it is said, will produce a preparation to serve quite similar purposes, consists of

Deodorized tincture of opium (U. S. P. 1870),	3½ fl. ounces.
Simple elixir.....	13 ounces.

One fluid dram represents 1 grain of opium.

6129. Cure for the Heart.

(G. W. P.) Fenner gives this formula for a heart corrector and regulator:

Digitalis, in coarse powder,	1 ounce.
Hyoscyamus, in coarse powder	1 ounce.
American hellebore (Veratrum viride)	2 drams.
Diluted alcohol, sufficient to make	1 pint.

Percolate the drugs with the diluted alcohol until a pint of tincture is obtained. The dose is from ¼ to 1 teaspoonful for palpitation or other disturbances of the heart.

6130. Official and Official.

(R. O. B.) There has always been more or less confusion relative to the proper employment of these two terms. It is now accepted, however, that official applies only to those articles which are recognized in the U. S. Pharmacopoeia, while official is employed to denote any substance used in pharmacy or kept in the stock of the pharmacist. The subject is found considered in very interesting form in an article in the Era of July 15, 1892, page 40, to which we would refer you.

6131. Antiseptic Powder.

(C. C. S.) We are not familiar with formula of Koch's antiseptic powder, but, as you state it contains among other ingredients alum, zinc and menthol, it would seem that it was of the same general type as many other so-termed antiseptic powders.

Here are two typical formulas:

(1)

Boric acid.....	70 parts.
Iodoform.....	25 parts.
Salicylic acid.....	4 parts.
Oil eucalyptus.....	1 part.

(2)

Ammonio-ferric alum.....	1 ounce.
Boric acid.....	1 dram.
Zinc sulphate.....	½ dram.

You can easily prepare some article of this general nature from the types given and perfume it to taste.

6132. Toothache Remedy.

(F. G. B.) In addition to the formulas for tooth waxes, given elsewhere in this department, we reproduce the following formulas from a previous issue:

1. Dental Stopping:

Tannin	4 ounces.
Camphor	8 ounces.
Colloidon	2 pints.
Carbolic acid.....	1 ounce.
Sulphuric ether.....	3 ounces.

2. Tooth Balsam:

Extract of opium.....	1.0
Camphor	1.0
Peruvian balsam.....	1.0
Powdered mastic	2.0
Chloroform	20.0

To be applied on cotton.
See also Era Formulary, formula 2770 and following.

6133. Perspiring Feet.

(Student.) Here are some formulas from the Era Formulary:

(1)

Talc	10 parts.
Alum	2 parts.

Largely used in Swiss army, preferable to chromic acid, and applicable even for sore feet.

(2)

Naphthalin in scales is simply strewn into the stockings or shoes.
--

(3)

Oleate of zinc, powdered..	1 ounce.
Boric acid, powdered.....	2 ounces.
French chalk, powdered..	3 ounces.

(4) A powder composed of salicylic acid, soap, talc and starch. The powder renders the feet firm, induces an agreeable softness, and removes all unpleasant odor, its action being to prevent the formation of butyric, valerianic, and other acids of the same family, which injure the feet.

6134. Phospho-Guarana With Celery.

(T. D. S.) The formula for this preparation is the property of a gentleman who has not yet favored the profession with it. We would suggest that you make a preparation of your own, and offer the following as an experimental formula: First make an elixir of celery and guarana with 2 ounces each of fluid extract of guarana and fluid extract of celery, with enough aromatic elixir (N. F.) to make 16 ounces. Filter, if necessary, and add to it 4½ pints syrup of roses, 2 pints syrup cinnamon and 8 fluid ounces of acid solution of phosphates.

The acid solution of phosphates, which, by the way, will serve you in place of the proprietary preparation you name, consists of the following:

Potassium phosphate..	80 grains.
Magnesium phosphate..	160 grains.
Sodium phosphate.....	80 grains.
Calcium phosphate.....	4 drams.
Orthophosphoric acid..	8 fl. ounces.
Water, enough to make	8 pints.

6135. Stamping Liquid.

(J. G. R.) You are, of course, aware that in the majority of cases a stamping powder is employed, and the Era has several times published formulas of this nature. See Era, January 15, 1893, page 254, in reply to query No. 584.

For a liquid we are told that the following serves well: Dissolve 1 dram each of rosin and copal in 4 fluid ounces of benzine and with a little of this liquid, triturate ½ dram of Prussian blue and finally mix thoroughly with the remainder.

Here is another, somewhat of the nature of an oil paint: Zinc oxide is to be ground in oil and then thinned with lard oil to the consistency of cream. If desired colored, Prussian blue, also ground, in oil, may be admixed with it. Such a paint is to be applied through a stencil, preferably with the use of a spatula. If it is desired to remove this afterward from the fabric, benzine may be employed. This method, it seems to us, is hardly a satisfactory one, and doubtless the first suggested you will prefer.

6136. What Is It?

(M. M.) Sends the following prescription, as near as we can make it out:

Rx.

Pilocarpine hydrochlorate,	5 grains.
Otto of rose.....	5 minims.
Oil sarma.....	4 drams.
Glycerine	1 ounce.
Oil sweet almonds.....	2 ounces.
Spirits camphor.....	3 ounces.

Mix, rub well into the scalp night and morning.

Our correspondent wants to know what the third ingredient is. We confess that as the name is written, we can throw but little light upon the matter, but inasmuch as the prescription sent us is but a copy, we think possibly there has been some error in transcribing. From the nature of the prescription, we see that it is a preparation for the hair and scalp, and we are inclined to think the ingredient in question is say, oil of sesame,

though there is, to be sure, little similarity in the names. We should like the opinions of our readers upon the matter.

6137. Cane Sugar to Maple Sugar.

(Inquirer.) The impression prevails that maple sugar is largely adulterated with cane sugar. The United States Agricultural Department has done a good deal of work in the examination of market samples of maple sugar and reports that at the present time the resources of chemistry are powerless to detect adulteration with cane sugar. The sugar of maple sap is identical in composition with that of the sugar cane, sorghum and sugar beet, and no discrimination in such cases can be made by analysis. Glucose added as an adulterant can, however, be easily detected by the various tests and estimation of its reducing power. There are various articles sold for adulterating maple syrup, particularly an extract or decoction of the hickory bark or wood. This extract is said to contain a flavor very similar to that of maple sap, and its use is reported to be in large amount. There are samples of so-called maple sugar on the market, which are practically nothing but low-grade brown sugars, possibly flavored to approach nearly in taste genuine maple, but, as stated above, no method of analysis will detect the adulteration of the ordinary maple sugar by cane sugar.

6138. Cancer Cure.

(B. H. G.) There are many so-called cures for cancer, including those which have found more or less recognition in regular medical practice and others which are of a quack nature. The U. S. Dispensary, in speaking of the use of zinc chloride, mentions its employment in combination for the treatment of cancerous affections, etc. Dr. Felix's Caustic Paste is employed in the treatment of cancerous growths, and is composed of starch, 37 parts; wheat flour, 112 parts; mercuric chloride, 12 parts; dry zinc chloride, 110 parts; pure iodol, 10 parts; croton chloral, 10 parts, camphor bromide, 10 parts; crystallized carbolic acid, 10 parts; and distilled water enough to make a stiff homogeneous paste.

Another method of applying zinc chloride is to triturate 10 parts of it with 2 parts of 60 per cent alcohol and, under constant trituration, incorporate 15 parts of wheat flour, and make the mass into cylinders of suitable size.

Arsenic is the chief ingredient in many so-called remedies for cancer, but the use of it or any other agent should be conducted only under the advice and supervision of a competent physician. We cannot give the necessary medical advice, but would refer you to some good physician, strongly cautioning you against treating cancerous affections by remedies of whose nature and effects you know little.

6139. Making Vinegar.

(N. C. M.) Vinegar is made from cider by merely allowing it to ferment at a temperature between 75° and 90°. The article known in commerce as vinegar is made from alcohol, which may, of course, be procured from any source. An outline of the process is given in the dispensary. Here are several formulas:

(1.) Put cider in a clean cask and add to it vinegar containing abundance of mother of vinegar; after some days, if the acetic fermentation has taken place and the souring is going on, add an-

other portion of the cider, and at similar intervals a third and fourth. When the whole has become vinegar, take out as much as is equal to the vinegar put in, and replace by fresh cider, and so proceed. The casks should never be but partly full; good exposure to air is necessary, and the temperature should be kept up to 86° F.

(2.) A domestic vinegar may be made by dissolving 1½ pounds sugar to each gallon water used, with ¼ pint good yeast. If the heat of the mixture be maintained at 70° to 80° F., aceticification will set in, so that in two or three days it may be racked off from the sediment into a cask; it then receives the addition of 1 ounce of cream of tartar and 1 ounce of crushed raisins; when completely free from sweet taste, bottle and cork closely. The juice of currants, gooseberries, and many other fruits, and of beets, may be thus made into vinegar, either alone or in combination with syrup.

Considerable information upon vinegar has been published from time to time in the Era, and we suggest you turn to the indexes of the various volumes for references upon the subject.

6140. South Dakota Pharmacy Law.

(R. F. R.) Certificates of registration are granted to persons not less than eighteen years of age who have had two years' experience in compounding drugs in stores where the prescriptions of physicians are dispensed, and who have passed a satisfactory examination before the State Board of Pharmacy. The board may, at its discretion, accept certificates from other states whose standards of competency are equal to that required in South Dakota. Graduates from colleges of pharmacy whose courses of study are approved by the board may be registered without examination. In the several sections of the law is decreed that the applicant for registration shall pay a fee of \$2, the same sum also for registered assistant. If applying for registration upon examination, the fee is \$2, with an additional sum of \$3 before the certificate is made out. The annual registration fee is fixed by the State Pharmaceutical Association, but must not exceed \$5. Retirement of a pharmacist from the profession shall not deprive him of the right to renew his registration when he wishes to resume practice. Sections of the law apply to the sale and registration of poisons and enumerate the acts which shall subject the pharmacist to penalties for violation of regulations. Adulteration and sophistication of drugs are also made subject to penalties. For further information and copy of law, address the secretary of the board, I. A. Keith, Lake Preston, S. D.

6141. Nervine.

(G. W. P.) We cannot supply the formula for the proprietary preparation you name, but would refer you to formulas 30, 56 and 253 in the National Formulary.

The following, taken from Fenner, are typical formulas for nerve preparations, such as are now on the market:

(1.) Bromide of ammonium, 1¼ ounces av. Valerianate of ammonium ¼ ounce av. Fluid extract of valerian 1 fl. ounce. Fluid extract of hyoscyamus 1 fl. ounce.

Fluid extract of coca..... 1 fl. ounce.
Syrup 2 fl. ounces.
Simple elixir, enough to make 1 pint.

Mix the liquids and dissolve the salts in the mixture; after standing 24 hours filter. Dose from a teaspoonful to a tablespoonful, as required.

(2.) Bromide of potassium..... 640 grains.
Sulphate of morphine..... 8 grains.
Valerianate of ammonium 256 grains.
Fluid extract of valerian 1 fl. ounce.
Fluid extract hops..... ¼ fl. ounce.
Water of ammonia..... 1 fl. dram.
Syrup 2 fl. ounces.
Simple elixir, enough to make 1 pint.

Dissolve the salts in the elixir and syrup, add the fluid extracts and the water of ammonia, let stand a day or two and filter. Dose, a teaspoonful to a dessertspoonful.

6142. Tooth Wax.

(A. W. W.) One of the following, taken from the Era Formulary, will doubtless serve you:

(1.) White wax 30 parts.
Venice turpentine 12 parts.
Mastic, powdered 5 parts.
Opium, powdered 3 parts.
Chloral hydrate 2½ parts.

(2.) Yellow wax..... 60 parts.
Venice turpentine..... 10 parts.
Pulverized dragon's blood 10 parts.
Pulverized mastic..... 10 parts.
Pulverized opium..... 2.5 parts.
Salicylic acid..... 5 parts.
Oil of cloves..... 5 parts.
Oil of cajuput..... 1 part.

With a gentle heat mix into a mass. Stir while cooling and roll out into sticks weighing 2.5 grams. Wrap in paraffined paper and preserve in stoppered bottles.

(3.) Paraffin 94 grams.
Burgundy pitch..... 800 grams.
Oil cloves..... ¼ fl. dram.
Creosote ¼ fl. dram.

Melt the first two ingredients and when nearly cool add the rest, stirring well. May be made in small pills or sent out in form of small cones or cylinders.

(4.) Melt white wax or spermaceti, 2 parts, and when melted add carbolic acid crystals, 2 parts; stir well until dissolved. While still liquid immerse thin layers of carbolized absorbent cotton-wool and allow to dry. When required for use, a small piece may be snipped off and slightly warmed, when it can be inserted into the hollow tooth, where it will solidify.

6143. "Tinting Oil" for Oil Painting.

(E. S. E.) Different of the fixed oils, such as linseed, poppy, nut, etc., are used for similar purposes, but just what particular one is meant by the title in this instance, we cannot say. A dealer in artists' materials in this city says that he most always furnishes poppy oil when "tinting oil" is asked for. Poppy oil is inferior in strength, tenacity, and drying to linseed oil, but it has the reputation of keeping its color better than the latter oil, and on this account it is generally employed in grinding white and most of the light pigments. Botted linseed oil is sometimes mixed with it to increase its

drying properties, or it may be prepared in the following manner: Take 3 pints or pounds of pure water, 1 ounce of sulphate of zinc (white vitriol), and 2 pounds of poppy oil. Expose this mixture in an earthen vessel capable of standing the fire, to a degree of heat sufficient to maintain it in a slight state of ebullition. When one-half or two-thirds of the water has evaporated, pour the whole into a large glass bottle or jar, and leave it at rest until the oil becomes clear. Decant the clearest part by means of a glass funnel, the beak of which is stopped with a piece of cork; when the separation of the oil from the water is completely effected, remove the cork stopper and supply its place by the forefinger, which must be applied in such a manner as to allow the water to escape, and to retain only the oil. Poppy oil, when prepared in this manner, becomes, after some weeks, exceedingly limpid and colorless.

Retouching Varnish.—The *Cyclopedia of Receipts* gives these:

- (1.)
 Sandarac 1 ounce.
 Castor oil 80 grains.
 Alcohol 6 ounces.
 First dissolve the sandarac in alcohol, and then add the oil.
- (2.)
 Alcohol 150 parts.
 Sandarac 25 parts.
 Camphor 2½ parts.
 Castor oil 5 parts.
 Venetian turpentine 2½ parts.

6144. Caustic Balsam.

(Student.) We published comprehensive reply to a similar query in the *Era* of July 15, 1893, page 63, but as you are a new reader, we reproduce the substance of what was then said.

Suppositious formulas have been printed with great regularity, and we can only reproduce the various guesses, allowing you to judge how near they come to the mark. One formula directs to mix 3 ounces oil of turpentine, 15 drops oil of thyme, ¼ dram oil of rosemary and ½ dram oil of amber. Very cautiously add 6 drams sulphuric acid, allowing the action to cease after each small addition, then set aside uncovered for six hours, and add 2 drams camphor, ½ ounce tincture cantharides, and sufficient sulphuretted linseed oil to make 8 ounces. The latter ingredient is made by adding 16.6 parts sublimed sulphur to 100 parts of linseed oil, and beating the whole to a brownish black liquid. Take care to avoid explosions or other accidents.

Another formula which, as you may see, is very different, directs to mix 4 drams croton oil with 2 fluid ounces cottonseed oil, add 20 minims of sulphuric acid gradually, under thorough stirring, and finally 2 fluid drams oil of turpentine, ½ fluid dram oil of thyme, 1 fluid dram oil of camphor, 4 fluid drams kerosene.

Last year the *New Idea* stated that the following represented the composition of the article:

- Sulphurated oil 2,190 parts.
 Oil turpentine 340 parts.
 Camphor 20 parts.
 Alcohol 30 parts.
 Sulphuric acid 90 parts.
 Oil of red thyme 3 parts.
 Oil rosemary leaves 10 parts.
 Oil of amber (rectified) 8 parts.

The alcohol may be replaced with alcoholic tincture of cantharides (1 to 10).

6145. Golden Tincture.

(E. K. H.) A wide variety of opinion prevails as to just what is meant when Golden Tincture is inquired for. Our contemporary, the *Western Druggist*, some years ago replied to a correspondent as follows: "The query has been answered by several other journals, where it is said that "Golden Tincture" is in demand among the Germans, and that Hoffman's anodyne, colored by means of tincture of turmeric, is always dispensed. This is a mistake. This turmeric preparation is mentioned in *Fenner's Formulary*, under the title of "Golden Anodyne"—and not tincture. The "goldtinktur" used by the Germans is the Liquor Anodynus Matlaci Bestuscheffii (now in U. S. P. under title Spirit of Ether), and is distinct from the Liquor Anodynus Mineralis Hoffmanni, the former containing iron, whence the golden color. As a matter of curiosity and to show with what a heterogeneous collection of names German apothecaries are obliged to burden their memories, some of the synonyms of this preparation may be enumerated: Liquor anodynus martialis, tinctura ferri muriatici aetherea, aether sulphurico-alcoholicus oxydulato ferrarius, spiritus aetheris ferrarius, spiritus, ferri chlorati aethereus, spiritus aethereus ferratus, spiritus sulphurico-aethereus ferruginosus, tinctura ferri chlorati aetherea, tinctura ferri tonica-nervina Bestuscheffii, tinctura ferri muriatici spirituosus-aetherea, solutio chloreti ferri aetherea, solutio muriatis ferri aetherea, aether martialis spirituosus."

Here are several other formulas for "Golden Tincture."

- (1.)
 Red lavender 1 part.
 Ether 2 parts.
 Acetated tincture of opium 2 parts.
- (2.)
 Ether 1 part.
 Chloroform ½ part.
 Laudanum 1 part.
 Alcohol 1 part.
- (3.) Eclectic formula:
 Balsam tolu 1 ounce.
 Resin guaiaac 1 ounce.
 Hemlock gum 1 ounce.
 Myrrh 1 ounce.
 Oil hemlock 1½ drams.
 Oil wintergreen 1 ounce.
 Alcohol 4 pints.

6146. Blackening Gun Barrels.

(B. H. G.) Mix 8 parts of butter of antimony, 4 parts sulphuric acid, and 2 parts of empyreumatic pyroigneous acid, or gallic acid. Apply several coats of the mixture to the polished steel until it is black enough. An English method of staining gun barrels brown consists in rubbing up 28 parts of sweet spirit of nitre with 25 parts corrosive sublimate, adding to this solution 33 parts powdered sulphate copper, 28 parts tincture of steel, and 500 parts of rain water. The mixture is allowed to stand in a well-closed vessel in a warm place for 12 hours. The gun barrel is rubbed with emery paper and polished, washed and dried thoroughly, and then coated over with this mixture. It is then well rubbed with a scratch brush and coated, and after repeating several times, it is polished with leather moistened with olive oil mixed with oil of turpentine, then dried and finally polished with oil.

A third method: Make a mixture of 1 part each of bismuth chloride and copper chloride, 2 parts corrosive sublimate, 6

parts hydrochloric acid, 5 parts alcohol, and 50 parts water. After the metal is thoroughly cleansed and free from grease, it is coated with this solution, allowed to dry, and the metal placed in boiling water, where it is kept for half an hour. If the color is then not dark enough, repeat the operation. The result is improved by placing the metal for a few hours in a bath of boiling water or coating the surface with oil and heating until the oil is driven off.

Here is what the *Scientific American Cyclopedia of Receipts* says on the subject: First take chloride of mercury and sal ammoniac; second, perchloride of iron, sulphate of copper, nitric acid, alcohol, and water; third, perchloride and protochloride of iron, alcohol and water; fourth, weak solution of sulphide of potassium. These solutions are each successively applied, each becoming dry before the other is used. No. 3 is applied twice, and a bath of boiling water follows Nos. 3 and 4. The shade of color is fixed by active friction with a pad of woolen cloth and a little oil. The shade thus obtained is a beautiful black of uniform appearance. This process is used in the manufacture of arms at St. Etienne, France. We regret that the proportions of the ingredients are not given. Several of our gunsmiths have made many inquiries as to the mode of producing the blue-black coating on the Whitworth and other English rifles. Perhaps the above solution will effect the object. The alcohol is used to make the application dry quickly. The perchloride of iron and the sulphate of copper in No. 2 should be used only in a moderately strong solution, and only about 10 per cent of nitric acid added to the water. No. 2 applied in three or four coats will form the common brown coating for gun barrels. After the last application has become dry, it is rubbed with a wire scratch brush, washed with warm water and afterward rubbed down with a composition of beeswax dissolved in turpentine.

IODINE EUGENOL.—Obtained by treating an alkaline solution of eugenol with iodine.

SALUMIN, ALUMINIUM SALICYLATE.—Recommended in catarrhal affections. Riedel.

DI-iodoform-Tetraiodoethyl-ene.—C₂I₄—Of all iodized antiseptics this contains the highest per cent of iodine; no odor, yellow crystals.

THIOFORM.—Basic dithio-salicylate of bismuth. A substitute for iodoform, inodorous, yellow-brown, insoluble powder. Advantages claimed, being inodorous and non-toxic.

LORETIN. **iodo-oxy-chinolin sulfonic acid.**—Iodoform substitute, inodorous, yellow; almost insoluble in water and alcohol; forms soluble salts with alkalis.

CHLORALOXIME.—v. Heyden prepared a new class of compounds from chloral and oximes:

This body, on being heated with water, separates its chloral. Recommended as hypnotic.

E. W. SIMMONS, *Castroville, Cal.*—My opinion is that the *Era* is about as near perfect as is possible for a pharmaceutical journal to be. It would be hard to tell which part is the most valuable.

EXAMINATION QUESTIONS.

This department is for the publication of questions and answers from our readers; the object being to place before them questions for self-examination and to indicate the directions in which study can be profitably carried on.

We solicit questions to which replies are desired, particularly questions suggested by personal experience and study.

Correct answers to the questions in each series will be published in a subsequent issue of the paper, as announced, together with the names of all persons sending us correct replies.

Write the number of the series at the top of your reply and write on one side of sheet only.

Address—EDITOR PHARMACEUTICAL ERA,

106 Fulton Street, New York.

F. R. CURRY.

The winner of the highest standing in the competition in Series No. 2 of Examination Questions is Mr. F. R. Curry, of Minden, Ont., who, like the winner of the first series, was awarded a total of marks but one short of the highest possible rating.

Mr. Curry was born in Omemece, county of Victoria, Ont., on June 7, 1860. He received his education at the high school in that town, and at the age of 14 was apprenticed to his brother, Dr. C. D. Curry, of Minden, Ont., for a term of three years. He passed his examination as a Chemist and Druggist in February, 1878, and in September of that year succeeded to the business of his brother. On March 17, 1879, along with all the other stores on that side of the street, his store was destroyed by fire, but the loss, however, was very slight, inasmuch as most of the stock was saved. He immediately resumed business in the sample room of a hotel, and later was enabled to go into appropriate quarters. On the 7th of July, 1880, he had another experience with the fire fiend; this time suffering total loss of store and stock, with but small insurance. Six months later he again started in business, moving into new premises, where he is still to be found.

Mr. Curry is a student of the higher branches of pharmacy, taking particular interest in the professional aspect of his calling and in every way endeavoring to fit himself for the highest duties of the profession.

SERIES NO. 2.

1. In the nomenclature of the Pharmacopoeia how are the titles of substances expressed?

2. What is effervescence? Deliquescence? Name two pharmacopoeial salts which effervesce. Two which are deliquescent.

3. Outline the official process for making syrup of wild cherry. Why is this process used? Upon what constituent does the virtue of this preparation depend? Why is glycerine used in the preparation?

4. Give the official title and the common and maximum doses of Kermes mineral, mercuric chloride, African pepper, tincture of opium, tincture of digitalis, tincture cantharides. Which are toxic, and what are the antidotes?

5. Belladonna. Give the botanical name. Common name. Country indigenous to. What part is used? When should it be collected? What is the active principle? What is the dose of the powdered leaves? Of the principal alkaloid? Name antidote for belladonna poisoning. Name the official preparations of belladonna.

6. What do you understand by a poison? An antidote? A dose?

7. Write correctly in Latin, without abbreviation, and state the quantities of each ingredient, a formula to make one pint of an elixir, of which each fluid dram is to contain 1 grain of quinine, 100 grain strychnine, and 2 grains phosphate of iron.

8. Write an equation showing the reaction which occurs in the preparation of syrup iodide of iron by the official process. Spirit Mindererus. Hydrated Alumina.

9. What is the difference between a hydrocarbon and a carbohydrate? Give an example of each.

10. What is an essential oil? Name several official ones, and state their properties and dose. How would you detect the addition of alcohol to an essential oil?

ANSWERS TO SERIES NO. 2.

1.

Pharmacopoeial titles are expressed:

(a) By the official name, which is always in the Latin language;

(b) By the English name;

(c) By the synonym;

(d) By the botanical name (in the case of plants);

(e) By symbolic formula (in the case of chemicals).

2.

Effervescence is a word derived from the Latin "effervesco," "to boil over." It is that commotion in a liquid caused by the evolution and escape of bubbles of gas, usually carbonic acid, as in the decomposition of a solution of potassium carbonate by acetic acid.

Deliquescence is the property that certain substances possess of absorbing moisture from the air.

Two pharmacopoeial salts which effervesce are sodium carbonate and zinc sulphate. Two pharmacopoeial salts which deliquesce are calcium chloride and potassium carbonate.

3.

The wild cherry bark in No. 20 powder is treated with a sufficient quantity of the menstruum (glycerine and water) and allowed to macerate 24 hours in a closed vessel, when it is packed into a percolator and the remainder of the menstruum poured upon it. Percolation is begun, and when the liquid has disappeared from the surface of the drug it is followed by enough water to make the percolate measure the desired quantity. In this percolate the sugar is dissolved by agitation without heat, the syrup strained and enough water added to complete the pre-

paration. Or, instead of dissolving the sugar in the percolate by agitation, it may be placed in a percolator and the percolate obtained as directed in the preceding formula poured upon it and a syrup prepared as outlined in the alternative pharmacopoeial process for the preparation of syrups. When wild cherry is allowed to macerate in water, an oil containing hydrocyanic acid is developed upon which the value of the syrup of wild cherry depends. This oil is produced from amygdalin by the action of a proteid resembling emulsin. It is coagulated or altered by heat, and the powdered bark introduced into hot water does not yield any volatile oil. The bark contains besides the volatile oil, tannin, gallic acid, resin, starch and other common vegetable principles. Glycerine is added to prevent precipitation.

4.

(a) Antimonium Sulphuratum:

Dose, 1-2 grains; maximum, 10-20 grains.

(b) Hydrargyri Chloridum Corrosivum:

Dose 1-32-1-12 grain; maximum, 1-12-1-3 grain.

(c) Capsicum:

Dose 2-3 grains; maximum, 5-10 grains.

(d) Tinctura Opii:

Dose, 5-15 minims; maximum, 15-30 minims.

(e) Tinctura Digitalis:

Dose, 10-20 minims; maximum, 30-60 minims.

(f) Tinctura Cantharidis:

Dose, 3-10 minims; maximum, 10-20 minims.

All are more or less toxic.

Those requiring special notice are corrosive sublimate, tincture of opium, tincture of digitalis, and tincture of cantharides. Antidote for corrosive sublimate, Kermes mineral and tincture cantharides: Give white of eggs (half dozen or more raw) or flour mixed with water. Promote vomiting with warm water containing baking soda, or cause it with mustard (a tablespoonful stirred to a cream with water). Give strong tea or coffee; stimulants if needed; laudanum. (20 drops) if much pain; demulcent drinks of flaxseed or slippery elm. Tincture of Opium: Give emetic (if necessary) of mustard (a tablespoonful stirred to a cream with water). Let patient have plenty of fresh air; maintain a horizontal position. Keep the body warm, but try to rouse the patient by ammonia to nostrils, cold douche to the head, friction and mustard plasters to limbs, etc. Use artificial respiration. Tincture of Digitalis: Give emetic of mustard (a tablespoonful stirred to a cream with water), followed by large draughts of warm water. Give strong tea or coffee, with powdered charcoal; stimulants (whiskey, etc.), if necessary; rouse the patient, if drowsy; heat and friction to extremities; artificial respiration.

5.

Belladonna. Botanical name, *Atropa belladonna*, common name, deadly nightshade, or belladonna; indigenous to Europe; leaves and roots are directed by the U. S. and Br. Pharmacopoeias, the latter including the young branches, which are probably not less efficient. The leaves should be collected in June or July, when the plant is in flower; the roots in the autumn or early in the spring, and from plants three years old or more.

The active principle is atropine $C_{17}H_{23}NO_3$, an alkaloid. Dose of the powdered leaves, one or two grains; of atropine, 1-100 to 1-50 gr. Antidotes and treatment for belladonna poisoning: Give emetic of mustard (a tablespoonful stirred to a cream with water), followed by large draughts of warm water. Tannic acid, or substances containing it, such as infusion of galls, strong tea, or coffee, etc., with powdered charcoal. Morphine, physostigmine or pilocarpine are the physiological antidotes. Official preparations of belladonna leaves; Extractum Belladonnae Foliorum, Emplastrum Belladonnae, Unguentum Belladonnae. Official preparations of the root: Extractum Belladonnae Radicis Fluidum, Linimentum Belladonnae. Atropine and atropine sulphate, while not strictly official preparations of belladonna, are obtained from the root.

6.

A poison is any substance which, when introduced into the system either directly or by absorption, produces violent morbid or fatal changes, or interferes other than mechanically with the conditions of health. An antidote is a remedy capable of preventing or counteracting the effects of poison, whether by physiological, physical, or chemical action. The term is sometimes used in a more general sense to signify any method of treatment employed against poison, or to counteract the deleterious effects of agents improperly used. A dose is the quantity of a medicine which, when taken, will produce therapeutic effects. It varies with the age, sex, idiosyncrasy, and general condition of the patient.

7.

℞ Ferri phosphatis gr. cclvj.
 Potassii citratis gr. xxxij.
 Quinine hydrochloratis gr. cxxviii.
 Strychine sulphatis gr. jū.
 Alcoholis ʒ. iii. j.
 Aque m. cccxix.
 Elixiris aromatici, quantum
 sufficit ad Oj.

9.

A hydrocarbon is a compound containing only carbon and hydrogen. Among the different series of hydrocarbons thus classified are methane CH_4 , ethane C_2H_6 , propane C_3H_8 , butane C_4H_{10} , valantane C_5H_{12} , etc., up to pentatriacontane $C_{35}H_{72}$. Of those mentioned the last named is a solid, quintane is a liquid, and the remainder are gases. Carbohydrates are compounds containing hydrogen and oxygen, and no other elements, the carbon atoms being six in number or a multiple of six, while the hydrogen atoms are twice the number of the oxygen atoms. As examples of carbohydrates are glucoses $C_6H_{12}O_6$, saccharoses $C_{12}H_{22}O_{11}$, myloses $C_6H_{10}O_5$. Among the glucoses are dextrose or grape sugar, laevulose, or fruit sugar, galactose, inosite and sorbin. Saccharose, or cane sugar, maltose, or malt sugar, trehalose, lactose, or milk sugar, and synanthose, are saccharoses, while dextrine, starch, glycogen, inulin, cellulose and gum are amyloses.

10.

Essential oils are those proximate principles to which in the majority of cases the odors of plants are due. They are characterized as odorous, volatile, inflammable liquids, freely soluble in alcohol, ether, chloroform, bisulphide of

carbon, benzol, the fixed oils, and slightly soluble in water. When dropped on paper they leave a fatty stain which disappears on the application of heat. They are sometimes called distilled oils from the mode in which they are usually procured. They exist in all odiferous vegetables, sometimes pervading the plant, sometimes confined to a single part; in some instances contained in distinct cells, and preserved after desiccation, in others formed upon the surface, as in many flowers and exhaled as soon as formed. Occasionally two or more are found in different parts of the same plant. Thus, the orange tree produces an oil in its leaves, another in its flowers, and a third in the rind of the fruit. Some essential oils, as those of bitter almond and mustard, are found during the process of distillation, out of substance of a different nature, pre-existing in the plant. The essential oils may be conveniently divided into three classes; 1, the nonoxygenated oils, consisting exclusively of carbon and hydrogen, as the oils of turpentine and copaiba; 2, the oxygenated oils, containing carbon, hydrogen, and oxygen, as oil of cinnamon, and most of the aromatic oils; and 3, the sulphuretted oils, containing sulphur, as the oils of horseradish and mustard. Alcohol in essential oils may be detected by several methods. 1. Alcohol will cause a diminution of the volume of the essential oil when it is agitated with an equal bulk of water or glycerine (according to Hager, 1888, diluted with 20 per cent of water), in a graduated tube; the difference indicates approximately the amount of the adulteration. If olive oil be used in place of water, the alcohol, unless present in very small quantity will separate. 2. Fused calcium chloride and dry potassium acetate are insoluble in volatile oils, but in the presence of alcohol become either soft or liquid. 3. Red aniline is insoluble in the oil, but becomes soluble if alcohol is present, producing a red color. 4. On heating potassium acetate and sulphuric acid with the oil, if alcohol is present, acetic ether is developed.

Oleum chenopodii, anthelmintic, dose, 3 to 10 minims. Oleum juniperi, carminative and diuretic, dose, 5 to 15 minims. Oleum cajuputi, stimulant diaphoretic, and anthelmintic, dose, 1 to 5 minims. Oleum hedeomae, aromatic stimulant, and emmenagogue, dose, 1 to 5 minims.

COMMENTS ON ANSWERS TO SERIES NO. 2.

1. In describing the titles of the various pharmacopoeial substances many seemed to overlook the fact that the word "official" is no longer employed by the pharmacopoeia as a descriptive word. This term was dropped in favor of "official." The adoption of the Pharmacopoeia as a standard authority by the government and a number of the states justifies the use of word "official," which is now generally understood to be synonymous with pharmacopoeial, and is applied to any substance or preparation recognized by the Pharmacopoeia.

2. A number did not recognize the distinction between effervescence and efflorescence, giving the definition of the latter term for that of the former. In some cases the water of crystallization is so feebly combined that it gradually separates when the substance containing it is exposed to dry air at ordinary temperatures. This separation is accompanied

by loss of crystalline character, the substance falling to powder. This change is called "efflorescence" and is illustrated by crystals of alum and ferrous sulphate. Notice then the distinction: the question called for a definition of effervescence, not efflorescence. It did, however, call for the names of two pharmacopoeial salts which effloresce.

3. A large percentage of the replies here failed to note that the present pharmacopoeial process for syrup of wild cherry directs the glycerin and a certain proportion of the water to be mixed and a sufficient quantity of the liquid used to macerate the drug. The present syrup contains less sugar, but fully three times as much glycerine as that made after the Pharmacopoeia of 1880. That work directs the glycerin to be added to the preparation after solution of the sugar in the percolate. But few of the answers contained any reference to the second or alternative process given in the U. S. P.

4. This question was very generally answered correctly, though a number of writers gave antimoni oxysulphuretum as the official name for Kermes mineral. An allied compound or rather mixture of Sb_2S_3 and Sb_2O_3 was official in the Pharmacopoeia of 1870 under that title. The present official Kermes mineral, Antimonium Sulphuratum, is a nearly pure Sb_2S_3 , with a very small amount of antimonious oxide. It is sometimes dispensed as golden sulphur. A few writers gave Hydrargyri Chloridum Mite as the official title for mercuric chloride. Such an error is inexcusable, as it might lead to very serious results. It only emphasizes the necessity of an intimate acquaintance with the nomenclature of the Pharmacopoeia. Two or three persons gave the official Latin name of black pepper for that of African pepper and two or three gave that of cubes in reply to the same question. A few failed to give any of the official titles.

5. The replies to this question have been of a generally satisfactory character, except that many of the writers gave Abstracatum Belladonnae as one of the official preparations of belladonna. All abstracts have been dismissed from the present Pharmacopoeia. A few failed to notice the changes made in the official Latin and English titles of the belladonna preparations, giving instead of the present pharmacopoeial titles, those of the former pharmacopoeia. Thus, Extractum Belladonnae Alcoholicum, and Extractum Belladonnae Fluidum of the Pharmacopoeia of 1880 are now Extractum Belladonnae Foliorum Alcoholicum and Extractum Belladonnae Radicis Fluidum, while Tincture Belladonnae '80 is now Tinctura Belladonnae Foliorum. The corresponding English titles for the same preparations were changed from alcoholic extract of belladonna, fluid extract of belladonna, and tincture of belladonna, to the present titles, viz., extract of belladonna, fluid extract of belladonna root, and tincture of belladonna leaves, respectively.

6. A very few of the replies to this question were rather incomplete, but by far the greater number of them were clearly stated and sufficiently comprehensive to demonstrate a thorough understanding of the terms on the part of the writers.

7. But very few replies were correct, most of them exhibiting an entire lack of even rudimentary training in the formation and expression of the pharmaco-

poetical names used in prescription Latin. Again obsolete or foreign pharmacopoeial titles were not infrequently substituted for those of the U. S. P. Thus, *Spiritus Rectificatus*, *Spiritus Vini Rectificatus*, *Alcoholis Portioris* for alcohol. The use of these titles is inadmissible in view of the fact that the U. S. P. gives alcohol as the correct Latin title.

Taking a typical formula for this preparation (N. F.) and writing the prescription first in English we have.

Take of

Phosphate of iron.....256 grains.
 Citrate of potassium 32 grains.
 Hydrochlorate of quinine, 125 grains.
 Sulphate of strychnine...14 grains.
 Alcohol 1 ounce.
 Water 360 minims.
 Aromatic elixir, a sufficient quantity to 1 pint.

Translating the above into Latin, "Take" becomes "Recipe." The Latin equivalent of "of phosphate of iron" is found in the genitive form. Phosphate and iron are changed into the genitive by writing "Ferri phosphata," and in the same manner the other salts become "potassii citratis," "quininae hydrochlorata," and "strychninae sulphata." Alcohol is considered by many an indeclinable noun. If it be, it will necessarily retain the same form it does in English. Considering it a declinable noun, it becomes "alcoholis." Water becomes (genitive case, singular number), aquae and aromatic elixir is translated elixiris aromatici. "A sufficient quantity to" is translated "quantum sufficit ad," the latter word, "ad," being an adverb and meaning "up to." The Latin word "adde," a verb, meaning "add," was not infrequently employed in the replies to this question where the word "ad" should have been used. Desirable abbreviations of the quantities are employed rather than the full Latin rendering.

8. The equation for the formation of ferrous iodide as it occurs in the preparation of the official syrup iodide of iron was invariably written correctly, when written at all. The official ammonium carbonate used in the process for making spirit milderus is not a normal carbonate (NH_4), CO_3 , as was given by a number of writers. It is a compound of 1 molecule of acid ammonium carbonate with 1 of ammonium carbonate from which a molecule of water has been separated. The last mentioned compound is regarded as the ammonium salt of carbamic acid, (a compound unknown in the isolated state), having the formula $\text{NH}_4\text{N}_2\text{H}_4\text{CO}_2$. The chemical formula for the official ammonium carbonate is $\text{NH}_4\text{HC O}_3\text{NH}_4\text{CO}_2$. A number of reagents precipitate aluminum from solutions as a hydrate. Some of these reactions were correctly indicated in the equation for the preparation of aluminum hydrate, but as they did not represent the official process called for in the question, they were not considered as correct answers. The official process directs alum, sodium carbonate, and distilled water.

9. and 10. Were almost without exception satisfactorily answered.

SUCCESSFUL.

The following correctly answered eight or more of the questions in Series No. 2.

Bangs, F. W., St. Johnsburg, Vt.
 Berry, F. C., Pittsburgh, Pa.
 Blackmore, Fred, Jackson, Mich.
 Bonnett, W. H., Brookville, Pa.
 Brooks, Miss Lou, Waeleer, Texaa.

Burns, James A., New Orleans, La.
 Carpenter, C. H., East Longmeadow, Conn.
 Carrel, A. S., Sewanee, Tenn.
 Coffey, Maurice G., Johnston, Pa.
 Coleman, T. B., Omaha, Neb.
 Condit, G. E., Natick, Mass.
 Cooper, Frank A., Venetia, Pa.
 Cunningham, W. J., Beaver Falls, Pa.
 Curry, P. R., Minden, Ont.
 Diehl, J., Buffalo, N. Y.
 Dixon, John B., Almond, N. Y.
 Dolan, F. L., Freeman, Mo.
 Earl, Fred George, New York.
 Eismann, Edward, Buffalo, N. Y.
 Graham, Howard B., Ashland, Neb.
 Grant, Henry T., Taunton, Mass.
 Happer, Walter C., Scandia, Kansas.
 Heinzel, H., West Superior, Wis.
 Herlick, P. E., Groun, N. Y.
 Hewitt, Herbert W., Milford, Mich.
 Johnson, James, Vermillion, So. Dakota.
 Johnson, C. H., Zealand, Mich.
 Kimball, H., Hartford, Conn.
 Knowlton, C. M., Evansville, Ind.
 Kurz, Otto R., Detroit, Mich.
 Langhorne, Jr., W. S., Portsmouth, Va.
 Langlois, J. A., Fall River, Mass.
 Lindbo, J. A., Petersburg, Neb.
 Lockie Bros., Buffalo, N. Y.
 Madajesky, E. H., Ironwood, Mich.
 McDonald, David, Sharon, Pa.
 McIntosh, Kenneth, Verona, Mich.
 McNaughton, D. J., Whitehall, Wis.
 Mutz, J. R., Edinburg, Ind.
 Palmer, Chas., Hennessey, Oklahoma.
 Partridge, Walter B., Owego, N. Y.
 Paterson, H. O., Atlanta, Iowa.
 Pfefferkorn, Alfred C., Lawrence, Mass.
 Rasmussen, Alfred, Rock Island, Ills.
 Regan, Alfred, Boston Highlands, Mass.
 Rich, Willis S., Dean, N. Y.
 Rosenwald, Aaron, Chicago, Ills.
 Steigleder, Edward L., Allegheny, Pa.
 Sylvester, Wilber, Port Huron, Mich.
 Taylor, W. Clark, Vineland, N. J.
 Thompson, S. Leslie, Lewiston, Idaho.
 Thrush, M. Clayton, Philadelphia, Pa.
 Townner, W. M., Randolph, Neb.
 Walsh, Mrs. J. S., Del Rio, Texas.
 Walsh, Mrs. J. M., Del Rio, Texas.

SERIES NO. 3.

Replies should reach us not later than May 15, 1894. Correct answers, together with the names of all persons answering correctly eight or more of the questions, will be published as soon thereafter as possible.

1. In what proportion must two quantities of powdered opium, containing 13.5 and 16 per cent of morphine respectively be mixed to produce 8 ounces of opium containing 14 per cent of morphine?

2. A quantity of official sulphuric acid weighs 15 grams. How many cubic centimeters does it measure? A quantity of official nitric acid measures 25 cubic centimeters. How much does it weigh in grams? In grains?

3. How would you distinguish between a root and an underground stem?

4. Which contains the larger percentage of alcohol; a solution made from equal parts by weight of alcohol and water, or one made from equal parts by measure of alcohol and water?

5. What is the percentage of bromine and how many grains of bromine are there in one ounce of potassium bromide?

6. What is an alum, chemically considered? Write the chemical symbols for two alums not containing aluminum. Name the pharmacopoeial and other varieties of alum.

7. Complete the following chemical equations:

8. What is meant by the following prefixes used in the nomenclature of salts: Mono, bi, bin, tri, quadri, di, bis, ter, tetra, super, hyper, per, sesqui, sub, bypo, proto, ortho, meta, pyro, para.

9. What are the chemical differences between red and yellow oxides of mercury? Give the chemical formula for each.

10. Which contains the more quinine (alkaloid), quinine bisulphate or quinine sulphate? Give the percentage of quinine in each salt and exhibit the figures used in your calculations.

SERIES NO. 4.

Replies should reach us not later than June 15, 1894. Correct answers, together with the names of all persons answering correctly eight or more of the questions, will be published as soon thereafter as possible.

(1) How would you distinguish between carbolic acid and creosote?

(2) What is a symbol, also what does a chemical formula represent?

(3) How would you prove that the specific gravity of iron is 7.50?

(4) Define stigma, and mention a drug which the pharmacopoeia directs shall consist wholly of stigma?

(5) How would you distinguish between gallic and tannic acids?

(6) Name the best excipient for a pill mass with each of the following: An essential oil, potassium permanganate, balsam copaiba, silver nitrate, corrosive sublimate.

(7) How would you dispense the following prescription?

Ferrous sulphate..... 60 grains.

Potassium carbonate..... 36 grains.

Mix, and divide into 24 pills.

(8) How many one-eighth grain doses should there be in one-eighth ounce bottle morphine sulphate as found in the market?

(9) What is an alcohol chemically considered? Name those covered by your definition that are official in the United States Pharmacopoeia.

(10) How would you prove the air to be a mixture and not a chemical compound?

(11) What is the difference between benzoin and benzol?

ALPHOL is a salicylic ether of α -naphthol and isomer of betol, the corresponding derivative of β -naphthol. It is prepared (Dr. d. Ph. Eis-Loth, Pharm. Jour.) by heating a mixture of sodium salicylate, sodium α -naphthalate and phosphorus oxychloride to a temperature of 120 deg. to 130 deg., the products being alphol, sodium metaphosphate and sodium chloride. The sodium salts are removed by washing with water and the alphol purified by crystallization from alcohol. It is said to resemble salol in its therapeutic effects, is administered in half to two gram doses, and in contact with the pancreatic and intestinal juices, splits up into salicylic acid and α -naphthol.

EUPARIN was obtained four years ago by Trimble from Eupatorium purpureum. C. C. Manger (Am. Jour. Phar.) has conducted further investigations upon this product and upon purifying it obtained it in prismatic or acicular crystals possessing a melting point of 116 deg. C. It is insoluble in water, sparingly in petroleum ether, readily in ether, chloroform, benzene or acetone. It forms no combination with sulphuric acid, but with chlorine a definite, though quite unstable product. Concentrated nitric acid converts it into picric acid, and on fusion with potassium hydrate it is converted into picrologol.

SHARP BROS., ALBANY, GA.—We do not want the earth for \$2.00. The Era is worth many times its subscription price. It is the embodiment of modern pharmacy and, typographically, a beautiful journal.

A DRUGGIST'S VISIT TO NEW YORK

DOWNING BUILDING
OFFICE OF
THE PHARMACEUTICAL ERA.

Lewis Hopp of the Mayell-Hopp Company, Cleveland, O., had been reading the Pharmaceutical Era for some time when he suddenly looked up, directed his gaze out onto Euclid avenue and appeared lost in thought.

"What's the matter, Lewis?" asked Tom Phillips. "Something in the Era given you food for thought?"

"Yes, indeed," was the reply. "I'm going to New York for a week or so."

"That's sudden," the other replied. "What do you want to go to New York for? Business is good."

"Yes, I know. But I see the Era has moved to New York, and that reminds me of a remark George Heebler made the other day. He said a man in our line, who could get down to New York without much trouble or neglect of business, ought to brush up his knowledge of men and things by going there at least once a year. It's about time I swept away some trade cobwebs and I'm going."

And as he said it Mr. Hopp brought his

Lewis C. Hopp tells what he saw of the New York Drug Trade.

hand down on his knee with a snap by way of emphasis.

Mr. Phillips didn't say anything for a minute or two. Then he remarked: "I think you're right. It will do you good for one thing, and then you may see something in our line that you want."

"That's just it. New York drug men are fine people to meet. They will show a man their goods, take him over their offices and factories, introduce him to men in the drug business whom it is well to know, and never expect him to buy out their business in return. It's a pleasure to meet such people, and I expect I shall have a first-class time and return with ideas and goods that will help our business a great deal. I'll wager the benefit to be secured from such a trip will profit me a thousand times more than the cost of going, staying and returning. I'm glad for one thing, too. The Era has located on Fulton street, right in the heart of the drug trade, and I can make its office my headquarters. They can give me points, too, on people to see, and that will save me time and shoe leather."

"Do you suppose the Era folks want to bother with visitors? Haven't they their own business to attend to?"

"Oh, don't you worry about that. Why, the Era folks'll be only too glad to welcome me, and they'll give me every chance to see drug men they know. Why, I'll go into their new office, shake hands with Brother Haynes, slap Newhall on the back for fun and I won't be able to find a minute to spend by myself, except when I'm sleeping, all the time I'm in New York."

"You make me want to go. You've been to New York since I have. Don't you want to stay here and let me go?"

"Oh, no. I see through that."

"Well, I'd like to go. But you ought to promise me one thing. When you come back you must tell me all about your trip; who you saw, what you saw and all that."

"I'll do it. I'll keep a diary and jot down everything."

"When do you start?"

"I think I'll take a train in the evening so as to get to New York in the afternoon. Perhaps Saturday would be the best day to go on."

"Where are you going to stop in New York?"

"I may take the advice of a friend and

stop at the Imperial. That's a first-class house and very popular with the drug people. However, that's an easy matter to settle."

So Lewis Hopp, grip in hand and the pleasant anticipations of the trip showing in his eyes, boarded the train for New York on Saturday afternoon. Phillips saw him off, and, as the wheels began to turn slowly, said: "Good-bye. Don't forget I want to know all about it when you get back."

"I'll remember, old man. Good-bye."

The Return to Cleveland.

"Here I am again, Tom," was the greeting two weeks later, as Mr. Hopp shook hands with his clerk.

"Glad to see you back, especially because you're looking so well. You look as if you had been in the country all the time. Didn't go around so much as you expected, did you?"

"Didn't I? Well, when you've got a week or two to spare I'll tell you half of what I did and about a hundredth part of what I saw."

"Well, we're just closing for the day. You've had lunch, of course? Yes, so have I. Can't you tell me a little of what you saw now?"

"I think I had better go up to the house. Come up with me, and after I've got off some of the dust of travel I'll give you an idea of my trip. I couldn't possibly tell you all about it, but I'll do my best to show you what it is to call on the drug trade in the metropolis."

So they went to Mr. Hopp's home, and after a while, being comfortably seated and supplied with cigars, Lewis Hopp started in.

"Well, I got into New York all right after a very pleasant trip. The day was so fine and my legs had been used so little in the train that I thought I'd walk down to the Imperial. You know that hotel is not very far from the station, only down ten blocks. I went over to Fifth avenue and down 32d street to Broadway. The Imperial on the corner. They gave me a fine room, looking out on Broadway, and I was right at home in a minute. See here, Tom, when you go to New York, stop at the Imperial. You'll find it's the best hotel for men in our line there is in New York. The drug people seem to have a

fancy for the Imperial, with reason, too. Lots of men in our line go there, and when they give little dinners to men in the trade they pick out the Imperial for the place every time. Then it's so handy to the cars. The Broadway cable, of course, runs by the door. You can get downtown just as quick on the cable cars as you can on the elevated, but, of course, if you want to take the 'L' it's station is just a short block above the hotel. Then there are ten or a dozen theatres near by, and after dinner all you've got to do is to step out onto Broadway and take your pick of places of amusement.

"You have never seen the Imperial, I believe. Well, it is a nine-story hotel of handsome appearance, and is fitted up in the best of style. You would be surprised to see the stream of people going in and out of that hotel. It seems to do as large a business certainly as any other hotel in the city, and I shouldn't wonder if it does more. I hear there are few New York hostlers that are making any money, and, more than that, I understand the Imperial heads the list of those that are doing a prosperous business. It must be so, for the owners of the hotel spent \$500,000 in the purchase of what is known as the Annex Hotel Imperial, which used to be the San Carlo.

Calling on the Era.

"Wait a second until I light my cigar. I'm talking so much I can't keep it lit. Well, I'm bound to give you all the details. It was Sunday when I got to New York, and I didn't stay up very late that night, as I wanted to be up bright and early Monday morning. I had a first-class rest, and after an excellent breakfast in the hotel I took the cable cars and went down to Fulton street. Those cars run as fast as one cares to travel, and I appreciated the difference between them and the horse-cars one used to ride on down Broadway. I found the Era office open. They are located on the first floor above the street in a new building, the Downing, and they have the whole floor. Just as I told you before I went away, they were very glad to see me, as they are to see any man in the drug line. I told them what I had come on for, and they offered to detail one of their young men to go around with me. That suited me to a T. I gave them some idea of who I wanted to see particularly and what lines of goods I would like to inspect. That was all right and we started out. There are so many drug houses in that vicinity that I should have been puzzled who to see first, but my young friend solved the difficulty by going straight to the office of the New York Quinine and Chemical Works, at No. 114 William street. Looking in at the windows before we entered I saw Thomas P. Cook, the vice-president of the concern. You remember, Tom? He used to visit us quite often, and I was glad to see him in such a good place. I guess he likes staying in New York better than he did being off on the road all the time."

"Is he the same genial Tom he used to be?" queried the listener.

"Just the same. Not changed a bit. We went into the office, shook hands with Mr. Cook and also with Mr. Howard Kirkland, who had been talking with him.

LOOKING DOWN FULTON STREET.

After talking over old times a while, we were shown around the office, which has just been fixed up in good shape. Then Tom asked us if we wouldn't like to go over to the works in Williamsburg, or Brooklyn, E. D., as it is called. We, that is, Mr. Cook, the Era man and yours truly went to the Fulton street station of the 'L' road and caught a Second avenue train right away. Getting off at 3d street we went down to the ferry. It was a fine day, and I enjoyed even that little ride over to Williamsburg.

New York Quinine and Chemical Works.

"The laboratories are only a short distance from the ferry landing. They take up about three-quarters of a block, and there are altogether about a dozen buildings. Three of these are used for the manufacture of quinine, two for the making of morphine, two for acetanilid, one for cocaine, besides two or three as storehouses. In these buildings there are in the neighborhood of 150 men working. We were received by the chemist of the company, who was pleased to

show us around. First he showed us through the order department. Then we saw all the various systems of weighing, bottling and corking. An expert weigher keeps two girls working on filling the bottles all day long. This weigher becomes so expert in selecting the quantity of quinine that, when weighed, the amount he has picked up is usually found to weigh exactly an ounce. From this room we went to the morphia room, where we saw morphia cut and bottled. A curious thing about this drug here was the form in which it was handed to the weigher, being in cubes. While we were looking at the cubes I remembered that in Germany chemists are compelled by law to have sulphate of morphia in cubes so as to more readily distinguish it from other alkaloids that are not poisonous, like quinine. The New York Quinine and Chemical Works does not do this because it is compelled to, however. The company thinks it is a wise plan, and follows it. We visited some other general weighing and bottling rooms, and then went through the yard, seeing the various buildings. In

the quinine building we saw the workmen grinding and extracting the bark, passing from there into the departments where the alkaloids are separated and combined. The next place visited was the long crystallizing room, where we found much of interest. You cross a bridge from that building to the drying room. From there we passed through the morphia and acetanilid buildings, and took in the other two ranges of buildings later. In them miscellaneous goods are produced. While as a rule chemical laboratories are not handsome places to visit, nevertheless I was impressed with the general good order and neat appearance of the various rooms, showing that the entire premises are under careful surveillance, leaving no opportunity for waste or loss.

A Good Point to Remember.

"While we were in the quinine shop one of the party asked what the difference in price was between the handsome product of this company and that of German manufacturers. The reply came promptly: 'Just the same. In spite of the fact that we have no protection, we sell at exactly the same price as the Germans, thus giving Americans a chance to favor home industries.'

"On our return to the office in New York we sat down for a short talk. I happened to have seen some new apparatus being put in at the laboratory, and ventured to ask what it was for. I learned that it was to increase the capacity of certain products, and that the new building we had observed being erected was for the purpose of manufacturing a number of additional products that they proposed to add to their list in a short time. One thing I was interested in was the way in which orders are handled, so I asked Mr. Cook about that matter. He said that it is the company's aim to ship all orders on the day on which they are received. This they were enabled to do in all cases except on very large miscellaneous orders, which, of course, might take until the next day to get together. This prompt attention and immediate shipment of orders is one of such importance that no pains are spared to accomplish this point. Invoices and bills of lading go forward promptly; in fact, the whole system in the office is one that secures accuracy and dispatch in handling the business."

"Well," said Mr. Phillips, "that was an interesting trip." And he lighted another cigar.

"Are you sure you want to hear about all the places I went that day?"

"Yes; I can almost imagine myself going with you."

"All right. Here's another good trip."

Seabury & Johnson.

"When we came out of Mr. Cook's office we went down William street and crossed Maiden lane, although that was going beyond our next calling place, Seabury & Johnson's. We stopped on the southeast corner of the two thoroughfares and I remarked that a view taken there, with the northwest corner of the crossing as a centre, would take in many of the drug houses of the city. After noting the changes that have taken place in the buildings since my last visit, we went across to the Seabury Building, at 59 Maiden lane. It is a

fine structure, seven stories high. We went up one flight to the offices, where we met Treasurer G. W. Hopping and Secretary Alfred H. Mason. Mr. Seabury had gone South a few days before, seeking a few weeks' rest after much hard work, both at the office and on the Republican Committee of Thirty, of which he is a valued member. I met an old friend, too, Mr. E. A. Sayre. He has charge of the sale of the firm's products. I was anxious to go over the building, and they very promptly showed me through the various departments. On the top floor are the stock and packing departments, the sixth floor being also given up to the firm's products. From that floor we went back to the second floor and inspected the offices of the company. On one side is the treasurer's department, on the other are the desks of Mr. Mason, Mr. Sayre, the chief salesman; Mr. Benjamin, the buyer, all with their assistants close at hand. Mr. Seabury's office is between the treasurer's and secretary's. Above Mr. Seabury's desk I noticed works of art, and, prominently displayed, a picture of James G. Blaine. As becomes an authority on bass fishing, the head of the firm has fishing poles and other paraphernalia of the Waltonian sport alongside his desk.

I think you would like to show something about Mr. Mason and Mr. Hopping. They are very fine men, and I enjoyed my talk with them. Mr. Mason has been a member of the A. P. A. since 1885, of the N. W. D. A. for many years, is an F. C. S. of London and Berlin, an F. R. M. S. of London, and an honorary member of the Pharmaceutical Associations of London, Liverpool, Toronto and Quebec. He has charge of the scientific part of Seabury & Johnson's business. Mr. Hopping has been with the firm for about nine years, and was previously connected with New York city banks. A point about Mr. Hopping. His bank training makes him stick to that old-fashioned idea that a promise once made should be kept. What a pity more men don't have the same idea."

"You're right."

"Well, although we didn't have time that day to go out to the factories of Seabury & Johnson, I went later, so I might as well tell you about that trip now.

At the S. & J. Factory.

"The factory is at East Orange, and to get there you take the Watchung branch of the New York and Greenwood Lake road. The ferry is at the foot of Chambers street, so we crossed town. I wanted to mail a letter, so stopped on the way at the Postoffice. The New Yorkers say their Postoffice is a pretty poor one, but it is a good deal better than ours here in Cleveland. It's a pretty ride out to East Orange; the Oranges are famous as good places to live in. Lots of New York business men live out there. I found the Seabury & Johnson Works consisted of three buildings, two long ones, the factory proper, with detached buildings for special purposes, and a large building for a store-house.

"First we went into the plaster department, which is in charge of Seward W. Williams, F. C. S., and member of the American Chemical Society. The mass for all the plasters is prepared under Mr.

Williams' supervision so as to insure accurate medication. The first things you see when you go into the rooms are the reels of plaster ready for cutting. In the same room, which is lighted by electricity from the firm's own plant, are the mixing and rubber machinery. Down in the engine room they showed me a 300-horse-power Corliss engine, a beauty, which everybody who sees admires.

"All the firm's machinery is carefully protected by guard rails, and that, I think, is a very good plan. The chief labor inspector of New Jersey says this factory is a model one, and so quotes it to other factory owners. As soon as we got out of the engine and boiler rooms Mr. Mason showed us the stream that supplies water for the factory. Crossing a bridge we came to the coal yards, and went on to the carpenter's shop, the rooms where oiled fabrics are made, and the mustard department. We saw thousands of yards of fabric in process of manufacture. On account of the inflammable character of the material in the two buildings I last mentioned they are detached structures and great care is taken against fire.

"We next went to the building where the sulphur candles are made, also in a detached building. Hydranaphol, the ideal antiseptic, a specialty with Seabury & Johnson, was explained to us. In the antiseptic department the firm strictly enforces a very good and necessary rule. The handling of the goods is done mainly by machinery, anyhow, but if one of the girls there goes out of the room for any purpose, even to carry a message or speak to anybody, she is obliged on her return to wash her hands with antiseptic soap. The handling of cottons and gauzes by machinery, of course, leaves very little handling to be done by the help, as I said, but the firm will not run the slightest risk in the matter. The girls look very neat, all dressed in nurses' costume. We dropped into the courtplaster department for a minute. All the employees take part in a fire drill, and there are a hose carriage and a hose house on the grounds. Seabury & Johnson's factory is certainly well conducted, well arranged and a very interesting place to visit."

At the Century Inn.

"I am wondering if you had any dinners at all while you were in New York. You haven't said anything about eating, except at the Imperial," said Phillips.

"That's so. I almost forgot that, but I was really coming to it. The day we called at Seabury & Johnson's, at the office, you know, not the factory, we were invited to take dinner at the Century. That is a very old tavern at No. 122 William street. We dined at the large table out in the rear room. The restaurant is much like one of the old-fashioned houses, a large room in front, fireplaces on the left, and a smaller, cozier one in the rear. At our table were Mr. Hopping, Mr. Mason, Mr. Lynch, a lawyer who was formerly in the drug business with McKesson & Robbins, and several other gentlemen, and we had a merry time while eating a very good dinner. I found no difficulty in getting good meals while in New York.

The Mallinckrodt Co.

"From the Century we went down William street to the Mallinckrodt Chemical

Works office, at No. 90. There we saw Mr. H. T. Jarrett, manager of the New York office of one of the greatest chemical companies in the country. The company occupies three floors and a basement, and I noticed what a full line of stock there was on hand. Mr. Jarrett told me that the company has twelve acres of ground over in Jersey City, and in the buildings there are made strychnine, mercurials, chloride of potash, granular, and many other products which can be more profitably made there than in the West. I was surprised at this, you can imagine, as I thought all the company's products were made in St. Louis. The works in Jersey are those of the old Charles T. White Company, which was a well-known house. Mr. Jarrett told me the company has been steadily growing, and that business so far this year, notwithstanding the general depression, has been better than ever before.

"Some of the special lines of goods which I saw at this office were their chemically pure acetic acid, carbolic acid crystals, pure granulated ammonium muriate, ammonium bromide, subnitrate of bismuth, crystals of eucaine, hydrochlorate, sulphuric ether, lodoforn crystals, and much more. Here's one of their price lists.

Sharp & Dohme.

"After spending a very pleasant quarter of an hour with Mr. Jarrett we walked up William street, and on my suggestion turned up John street, as I particularly wanted to call at the office of Sharp & Dohme. You know all about their pepsin products, but I had some questions to ask about their 1 to 10000 pepsin, and also wanted to see a friend in the office. Dr. Seem was at his desk, and he gave us an old-fashioned welcome. He showed us some of the pepsin I spoke about, and also some of the regular standard Webber-pepsin, 1 to 6000. The 1 to 10000 is the nearest approach to the ideal pepsin ever made, the purest and best to be obtained. Ergotole, the liquid preparation, two and one-half times the strength of the fluid extract, was also shown us. I think you saw the firm's display at the World's Fair. Well, they have part of it at the office, together with the three official ribbons, or prizes, awarded by the commissioners. Sharp & Dohme had eleven diplomas given them for their show and two medals besides.

"I was asked if I couldn't go down to Baltimore before my return home, but you know that I didn't have time to go hardly anywhere except in the city and a few places near by. I should have enjoyed a visit to Baltimore, especially as I was a classmate of Mr. Webber, who is in the company's laboratories. Dr. Seem told me something about the Baltimore laboratories, however. They are near the Baltimore and Ohio station in that city, and the buildings are six and seven stories high. They have more floor space, probably, than any other company in this country.

"I was introduced to Mr. E. Stoffregen, the general business manager of the company, a very genial and well-known man in the trade. We were shown through the office and saw their full lines of stock. I could have spent a much longer time at Sharp & Dohme's office, as they are very 'new' people, and had much of interest to show me."

"Where did you go next?" queried Mr. Phillips.

At W. H. Schieffelin & Co.'s.

"W. H. Schieffelin & Co.'s was our next calling place. It was getting late in the afternoon and we had to hurry. The Era man knew Mr. Mersereau, and we found him at his desk. What a busy place Schieffelin's is! It seemed like imposing on people to call when they were up to their necks in work, but our reception was very pleasant. One point of special interest that Mr. Mersereau spoke about was that this is the firm's 100th year of business. You could talk about this firm for hours and still leave many things unsaid that would be interesting.

"We were taken through the building, which is at the corner of William and Reekman streets, and on every one of the six stories, as well as in basement and subcellar, we found the same evidences of order and intelligent work. You know all about their products and the class of goods for which they are sole agents in this country, more especially those of the Farbenfabriken vorm Friedr Bayer & Co., of Elberfeld, Germany. There are sulfonal-Bayer, somatose, aristol, phenacetin-Bayer, piprazine-Bayer, and I don't know how many more. W. H. Schieffelin & Co.'s own products, among them soluble pills and granules, have a very wide sale, not only in this country, but in England and South America. They have a very large number of clerks. I should think they would need them. Their correspondence must take tons of paper every year. Mr. Mersereau said that the firm was now moving its laboratories from Front street up in the vicinity of 1321 street, where a large factory will be fitted with the latest improved apparatus."

One Dinner Recalls Another.

It was now dinner time, and the returned traveler and his friend stopped the talk about the New York trip until they had eaten a hearty meal, during which Mr. Hopp took occasion to tell his friend something about the dinners he had been invited to while in the metropolis. One in particular was that partaken by invitation of Mr. Thomas F. Main of Tarrant & Co. One feature of that pleasant little affair was a very fine sirloin of beef, done to a turn, and brought on with an appetizing concoction of rice, mushrooms and red peppers. After dinner Mr. Hopp thought his friend might wait until the next day for another installment of the story of the trip, but Mr. Phillips was anxious to hear more, so they returned to Mr. Hopp's room and the story was resumed.

"I was pretty tired that night, so after I had had dinner at the Imperial I concluded not to go out, but to stay in the hotel and write some letters. I went to the writing room, expecting to do about an hour's work on my mail, but some of those beautiful pictures that adorn the walls of the house so attracted my attention that I completely gave up the idea of writing. I went from one painting to another until I had seen about all of them and when I got through I felt satisfied that I had spent my time well, especially as I had no pressing business to write about.

"When I got up the next morning I was prepared for another day's journey among the drug firms. I met my companion of

the previous day at the Era office, and while he finished some little work he had on hand I had a chat with the editor of the Shipping and Commercial List.

The Tilden Company.

"Our first call that morning was at the office of the Tilden Company, at 41 John street. Mr. Otway Latham, manager of the company, received us. He is a young man of wide experience, having been for some years in the pharmaceutical line. The Tilden Company is the originator of the fluid extract business, and the first to put gelatine-covered pills on the market. The company organized in 1848. Under the energetic management of Samuel J. Tilden, Jr., the business has greatly increased, although during nine years, from 1881 to 1893, lack of energy had kept it out of touch with the trade. The New York office is a branch of the big concern at New Lebanon N. Y. I had heard a good deal of Mr. J. H. Cox, the secretary and treasurer of the company, and wish I could have seen him, but he is located at New Lebanon. He is a very affable, energetic man—a pusher from Pushville. Why, that company has more business now than it can attend to, but with increased facilities they hope to get up with their orders soon."

"That Samuel J. Tilden, Jr., is the nephew of Samuel J. Tilden, the Sage of Greystone?" asked Mr. Phillips.

"Yes," was the answer.

Tarrant & Co.

"From the Tilden Company's office," resumed Mr. Hopp, "we went to Tarrant & Co.'s, at the corner of Warren and Greenwich streets. Wishing to show me some of the newspaper offices, the Era man went a little out of the way, and as we stood on the corner of Mall street and Park row he pointed out the homes of the daily press, some of which are in buildings erected since my last visit. Two buildings that took my eye are those of the Home Insurance Company and the Postal Telegraph Company, on the other side of City Hall Park, or, rather, on Broadway, opposite the Park. Then we walked up Mall street—by the way, that street is a disgrace to New York. What with dirt and stones, wagons, horses, oat-bstrewn pavements, it's a wonder the Postoffice people don't complain. We saw the statue of Nathan Hale, who was hanged by the British in what is now City Hall Park. That's an odd idea for a statue, a man ready for hanging, with his arms pinioned behind him. Tarrant's people were pretty busy when we got there. I saw Mr. T. F. Main first. He is the chairman of the drug section of the Board of Trade, too. I found an old friend, Mr. S. W. Lathrop, who is in the sundries department, and he showed me all the fine things in that line. Mr. George E. Evans is at the head of the department. I saw that showcase of Hinds, Ltd., which the Era had quite an article about the other day. It is now filled with the latest consignment, or part of it, that Hinds sent over from England the other day. Tarrant's has L. Dehamm's line of tooth brushes, very fine articles, indeed, and I saw some of their best articles in this line. Fancy atomizers is a special line with the company also, but you know they have all

sorts of druggists' sundries, and all of the best. They have many hundred cases of the finest sponges. Did you know that the demand for sponges in certain sizes is more than the supply, and that's what makes the prices go up? Tarrant's perfumes are very fine, and I had a good chance to examine their stock. A particular push is made on the 'Modesty' special, a very excellent perfume.

"Speaking about perfumes reminds me of a statement made by Mr. Main. He said that Tarrant never puts out on the market any specialty unless the firm found it to be the equal of anything in the same line made by other firms. They showed me some bottles of their own make of perfume, gotten up in a style fully equal to the best French articles. We sampled some of their fruit syrups, and found them excellent. There isn't anything about Tarrant's Aperient that I can say that will be new to you. It stands for itself. We then went to that little dinner I spoke about when we were downstairs.

"On our return we were shown through the firm's admirably arranged building. One stockroom is just like another, of course, so you won't expect me to tell you about Tarrant's. But down in the basement we saw the workmen bottling Leopold Hoff's Malt Extract, for which the firm is the sole agent in the United States. The machinery is run by electricity. We noticed the neatness with which all the floors are kept, and the engine room was no exception.

"From Tarrant's we made a long jump to H. N. Fraser's drug store, on Fifth avenue, No. 262, I think it is. We took the Ninth avenue "L" road, which has a station right at Tarrant's. My Era guide told me we would be not over twelve minutes getting up to 23d street. We got there in just eight minutes. We took a surface car across town to Fifth avenue. Just as we were about to get off we saw Lillian Russell, bank-book in hand, come out of the ladies' entrance of the Fifth Avenue Bank. She is playing in "Girode-Girofa" at the Casino. I went there one evening and enjoyed the play very much. But to return to our visit to Fraser's.

Fraser & Co.'s Retail Store.

"The retail store of Fraser & Co. at 262 Fifth avenue is one of the oddest things connected with the drug business in New York. Perhaps 'odd' isn't just the adjective to use in describing such an establishment, but it is so unlike any other drug store anywhere that you would naturally apply that word. Fraser & Co. have been in business about twelve years—always on Fifth avenue—having, until a year ago, occupied the basement at No. 208. Now they have a five-story and basement building, 20x100 feet. Fraser & Co. have always styled themselves apothecaries, and from the day he started Mr. Fraser (who, by the way, hasn't had a partner in the retail business for some years) has aimed to run an apothecary shop simply as such. He has never had a soda fountain; never sold cigars, tooth brushes, candy, stationery, or even toilet preparations or patent medicines. Of the latter he keeps only such as are called for on prescription, and he informed me that they did not constitute one per cent.

of his sales. This would strike you and me as 'odd,' but it isn't what I particularly had in mind when I used that word.

"In the first place the arrangement of the ground floor is different from anything you ever saw in a drug store before. The fixtures are all of oak, severely plain, but of a quality in keeping with the swellest store on the swellest avenue in New York. About twenty-five feet of the front is occupied on one side by the desks of the manager and the cashier and chairs for customers. There is a handsome rug in the centre of the space, and on this a table, but whether the table was used for the familiar city directory or some other class of literature I didn't notice. Back of this space the walls are lined with shelving, the upper tiers of which are reached by railway ladders, everything

of the stocks of the various makes of pills and similar preparations within easy reach of the prescription clerks are unique, but would probably be appreciated on sight by most drug clerks. In this part of the store also is a very complete stock of the tablet tritirates and compound tablets with which the name of the house is generally associated, but I did not find tablets dominating the business to the extent I had expected from this association. They constitute an important feature of the stock, but are there simply as one form of pharmaceutical product called for by physicians either on personal order or prescriptions.

"Mr. Fraser was the first maker of the tablet tritirates, and he and his concerns may be said to have created the tablet business, but the manufacture of Fraser's Tablets some years ago outgrew

FROM A CORNER OF WILLIAM STREET AND MAIDEN LANE.

being of the same plain but highly polished oak. Across the room are several showcases, reaching to the floor, which are filled with sick-room appliances, while the shelving is largely given over to strictly pharmaceutical preparations, such as are mostly sold in original packages. A large share on one side is, however, given up to prescription books from the beginning of the business, the formidable appearance of which attracts the eye of the customer, for everything in the store, including the preparation of prescriptions, is in plain sight of everybody in it. About midway of the room on one side is a passenger elevator, and in the centre the desks of the checking clerk and a typewriter. Back of this, and running lengthwise, is the prescription counter, with working space for five clerks on each side, and a complete stock of dispensing chemicals and appliances for each clerk. The arrangements for conveniently carrying

the confines of a retail store, and was made a distinct business, being conducted by a corporation, of which Mr. Fraser and Mr. Peters are the owners, and which gives employment to over one hundred persons, its factory being located downtown, near the bridge.

"The relation which this retail store bears to the Fraser tablets, therefore, appears to be that which any other retail store, equally appreciating their value, might bear to them—namely, that of a distributor. Mr. Fraser, while recognizing great value in these adjuncts to his retail business, believes that they would be equally valuable to any other retail establishment. In other words, he believes, and bases his belief on facts shown by the success of other stores which have carried full stocks of these goods, that it is the fact that this particular store carries a full line of Fraser's tablets, and not because it happens to be Fraser's

store carrying Fraser's tablets, that brings into the large prescription trade for these preparations. Thus their influence upon his business as an apothecary he believes to be a complete refutation of the theory that the sale of tablets as instituted by the Tablet Company, and imitated more or less openly and energetically by other pharmaceutical manufacturers, is necessarily inimical to the best interests of the retail druggist.

"But to continue with a description of the store. A space of about twenty-five feet at the front of the second floor is called off for use as an office and library, and the bookcases on either side, extending to the ceiling, contain over 2,000 volumes, constituting what is said to be one of the most complete medical and pharmaceutical libraries in New York, all of which is very convenient for physicians and is made good use of by them. The rear of this floor is occupied by the book-keeping department, and the intermediate space is given up to medical and surgical supplies of one sort and another. Very few, if any, surgical instruments are carried, but there is a large assortment of sick-room accessories which it would be difficult to find anywhere else in this country.

"The third floor is for the storage of heavy goods, such as are not carried in the basement or cellar, and the fourth floor is the analytical laboratory and microscopical room. This store makes a specialty of analyses for physicians, as well as for the public, and also, I found, does a good deal of work for doctors and druggists in other parts of the country, who send in for analysis or microscopical examination samples of all sorts of things related to health and sanitation. The laboratory is a model in its way, and contains the most complete microscope in America, and it all adds to the oddity to think that it is simply an adjunct to an apothecary shop.

"The fifth floor is furnished with the ordinary appliances for such manufacturing as is necessary for a retail store of this character, containing steam evaporators, stills and drying closets, percolators and so on.

"Does this all pay? you ask. Undoubtedly it does, but whether the experiment which Mr. Fraser has successfully made would succeed somewhere else is yet to be determined. However, any druggist can learn something of value by a visit to this store, and if he gets as cordial a reception as I did he won't regret the call."

John Matthews Apparatus Company.

"After leaving Fraser's it was a question whether we should keep on visiting some of the retail stores or go over to the offices and factory of the John Matthews Apparatus Company, at First avenue and 26th street. We concluded that it would be better to visit the Matthews company first, so we walked down 26th street, past the Madison Square Garden, and on over to First avenue. As we entered the office of the company, which is just across the avenue from Bellevue Hospital, we met Mr. John Doherty, the assistant manager, and had quite a chat with him. The John Matthews Apparatus Company has a very large building, with five floors, but is of irregular shape, several buildings having

been thrown into one as the company needed more room. The original factory was on the same site and was established in 1832. The showroom for apparatus, the marble ones being especially noticeable, is a very large place, and we were shown through it by Mr. Doherty. The firm imports many varieties of marble from France, Italy and Belgium, and also uses a great quantity of onyx from Mexico. Mr. Doherty told me that the use of Mexican onyx for fountains is becoming more and more common. In fact, there is quite a rage for it, so to speak. The firm's Climax system for storing syrups in removable glass jars with a measuring chamber for the syrup, which is emptied at one stroke by a very easily worked and simple device, is claimed by the firm to be the cleanest, most rapid and most practical method for storing and dispensing syrups. The company does a very large business in bottling machinery. They have a new system, which is being adopted to a great extent in other large establishments, and Mr. Doherty showed us the machinery; department in order that we might get some idea of the work.

"It is through Matthews' new system of carbonating machinery that druggists are enabled to have their steel fountains charged to their full capacity, instead of only two-thirds capacity, as heretofore. I think it would be a good thing if out-of-town druggists would call at the Matthews company's office when they visit New York, for there is enough of interest to make such a call worth while. Before we went out I was introduced to Mr. L. F. North, the business manager; Mr. T. N. Seymour, chief salesman; Mr. John Ormrod, superintendent of the factory, and several other gentlemen.

Seclog Two Retail Stores.

"After leaving the Matthews company's office we followed our programme of visiting some of the uptown retail stores. We only made short stays at them, as we wanted to call at the offices of the Bovinine Company on South Fifth avenue and the India Rubber Comb Company on Mercer street. Our first call was at Hudnut's. A few years ago Mr. Hudnut had a drug store in the Herald office, at the corner of Broadway and Ann street. It became a popular resort for newspaper men, and was soon well known, by name at least, in many parts of the country. Now Mr. Hudnut's, at 25 Broadway, is as well patronized by ladies as it used to be by men. The soda water draws them all the year around. The promenade up and down Broadway at this point seems to pass into the store, halting at the counter for ice-cream soda, and out again down the broad sidewalks. Hudnut makes a specialty of displaying toilet articles, perfumery, etc., and his store always looks very inviting.

"Being pressed for time I advised taking a cable car down to J. N. Hegeman & Co.'s store at 70 Broadway. Perhaps you think I was foolish to want to ride from 25 to 70, but the distance is considerable. Union square comes in between those numbers, and it would really have been quite a walk. My companion agreed with me, so we rode down Broadway, commenting on the various points of interest as we passed. We got off at Hegeman's and

went in to shake hands with the proprietor, but he was out. However, we looked over the store. Mr. Hegeman has another drug store further up Broadway, and I had one on 29th street. A fire recently burned out or caused the closing of the 50th street store, but Mr. Hegeman will soon have it opened again."

"I remember reading something about that fire," broke in Mr. Phillips.

"Yes, and it was particularly unfortunate because it came at just the season of the year when the store would have done a great deal of business. Was the Summer opens, or rather, just as soon as the weather becomes mild, the people begin flocking to Central Park, and thousands go right past that store. Some New York druggists thought that the store was rather out of the way, but they are mistaken."

"Did you do much more visiting that day?" asked Mr. Phillips.

"We went to the two places I mentioned and that closed our day's tour. I'll tell you about them, and then I think we'll adjourn this sort of one-sided meeting until to-morrow."

"All right. Come and take dinner with me, and I will be glad to hear about some of your other trips."

The Bovinine Company.

"Well, to finish up that second day's calls. Let me see. I was talking about Mr. Hegeman's store, I think. From there we went down Broadway to Bleecker street, intending to visit whichever came first, 65 South Fifth avenue, or 9 Mercer street. We naturally supposed they would be near each other. Thinking it best to inquire first, we found that while the numbers on South Fifth avenue began at Washington square, the numbers on Mercer street began at Canal street, and were highest at Washington square. Walking was by this time become pretty tiresome, but we managed to stand it. At the Bovinine Company's office we found Dr. H. T. Champney.

"He told us about how he first began to introduce that article to the trade. It seems that he bought the formula from Dr. J. P. Bush of Boston. He tried for a long time to get some moneyed men interested in the matter, but they fought shy of it. Finally a factory was started. It was, of course, on a small scale, but in 1855 there came, unexpectedly, a great advertisement for the extract. Gen. Grant was then stricken with what proved to be his fatal illness. The condition of his throat prevented him from taking solids, and Dr. Douglass was induced to adopt Bovinine. Had the distinguished sufferer never taken Bovinine, it is probable he could not have lived to write his 'Personal Memoirs.' When the public found this out—and good care was taken that it should do so early—the demand for the extract grew to grand proportions. 'The physicians of the country found out that Bovinine was just what they wanted,' said the doctor to me, 'and they lost no time in recommending it.' The company moved its whole plant, with the exception of its laboratory for compounding the extract, from Chicago to New York, in June, 1882. The reason for this was because the concern believed, and still thinks, that New York offers better facilities for business, and is really the

THE NEW YORK POSTOFFICE BUILDING.

headquarters for proprietary articles in this country.

"I knew the Bovinine Co. had foreign agents, but I did not know that it has had a plant in England for five years, in France for four years, and has one now in Norway that has been in operation for six months. The house had preserved a conservative policy, and has met with great success. We found the doctor a very agreeable gentleman, and a fluent conversationalist. But we had to hurry away, much as we would have liked to stay and chat with him longer.

The India Rubber Comb Co.

"The India Rubber Comb Co., at No. 5 Mercer street, was not far away. We called for President F. Achelis, and were lucky enough to catch him in, although it was after 5 o'clock, and rather late for calls. He told us that the one special thing his company strived for was to turn out the very best articles in their line that were ever put on the market. The concern makes no cheap things, does not believe the public is best served by the sale of cheap articles. They had, when the patents were in existence, the patents for the Goodyear hard rubber patterns. Mr. Achelis said to me: 'We are proud of our reputation, and we will not make anything but what is good.' As I came from the West, he said that the people out there should change their ways a little, and not buy the cheap goods. Firms that deal in the poorer class of articles simply

because they are cheaper should educate the people up to the idea that the best is the only kind of rubber goods it is wise to purchase. The company's trade mark appears on almost every article it turns out, and the stamp is 'The I. R. Comb Co., Goodyear, 1851.' Mr. Achelis showed us a big line of samples of unbreakable combs, fancy atomizers, water bags, syringes, and also many kinds of goods outside of the druggists' sundries line.

"That was our last call for the day, and I think both my companion and I were glad to be able to sit down for a rest. I slept like a top that night. However—and I almost forgot it—I went to the Madison Square Garden Theatre; see '1492' and the living pictures that evening, and enjoyed the show first rate."

As Mr. Phillips bade Mr. Hopp good-night, he said: "I hope I am not imposing on your nature, Lewis. I have enjoyed your story very much. Don't forget to dine with me to-morrow and tell me some more."

Mr. Hopp did dine with Mr. Phillips the next day, and also pleased his host by resuming the story of his jaunt through the drug trade of New York. He began it with a slight reference to the fact that while in the metropolis he had actually done more walking than he did in two months in Cleveland. He thought it had done him good. Resuming his narrative, he said:

College of Pharmacy.

"The next morning before going to the Era office I called on Dr. Coblentz, at the College of Pharmacy, on 23d street. He took me over to the new college building, on West 68th street, near the Boulevard. The Sixth or Ninth avenue elevated road carries one very near the college, so the students will find it easy to get to their new quarters. From the Professor and from others of the faculty I learned that this college is making great efforts to give the students practical instructions in all branches. Then their laboratory fittings are the very best for practical work that this country can produce. The college is now in possession of the Canby Herbarium, worth \$25,000. Part of the money with which this herbarium was purchased was subscribed by friends of the college, and the rest was furnished by the college.

"Perhaps you would like to hear something about this new building. We started at the basement and went up through the building. In the basement there are the usual heating and ventilating apparatus, the gymnasium, toilet rooms and large storerooms for college supplies. On the first floor are the office of the college, the library, meeting rooms for members and trustees, and a special room for the comfort of lady students, of which the college has a number every year. The herbarium to which I referred is also to be located on this floor.

"On the second and third floors are lecture and 'quiz' rooms. The lecture room is particularly fine, and I spent considerable time examining all its features. Every student—and 500 can be accommodated—has an unobstructed view of the lecture table, and every seat is an independent and comfortable armchair, with an extension on the right arm so that the boys can take notes easily. On the fourth floor is the department of botany and materia medica. There are a museum of materia medica, a microscopical laboratory for 100 students working at microscopes together, and also special rooms for the accommodation of the professor of the department and his assistants. 'Quiz' rooms take up part of the fourth floor.

"On the fifth floor is located the pharmaceutical laboratory, which will accommodate 450 students, 150 working simultaneously, each student having his own closet and drawer for apparatus. There is probably no laboratory in the world so well fitted for the instruction of students in practical pharmacy. The floors are asphalt, perfectly water-tight, and the drainage has been designed with special reference to pharmaceutical manipulations, on a practical scale. The heating and ventilation of this laboratory have been thoroughly studied and arranged for. On this floor also are the supply room for the laboratory, a scale room and accommodations for the director and his assistants.

"On the sixth floor is located the chemical laboratory, with accommodations for 450 students, or 150 working at one time. Like the pharmaceutical laboratory, the floors are asphalt and water-tight. I noticed the ventilation of this room has been well provided for, with high side windows and two large skylights. On this floor there are a stock room for supplies,

NEW BUILDING OF THE COLLEGE OF PHARMACY.

a scale room and accommodations for the director and his assistants. All the laboratories have been specially arranged to give the students practical instruction, by making them work with their instructors and at the same moment. I think the College of Pharmacy of the City of New York is the best equipped institution of the kind in the world. The college claims that it is without a rival anywhere, either in its faculty, its methods or its accommodations."

"How about rates?" asked Mr. Phillips.

"Extremely low, I heard it said, I didn't ask for figures."

Fairchild Bros. & Foster.

"One of the most pleasant calls of the week was that at the office of Fairchild Bros. & Foster, at 82 Fulton street. The click of the typewriter and the general air of business activity in the office indicated plainly that there was no great depression in the branch of business to which this firm devote themselves. Mr. S. W. Fairchild, who presides over the

business affairs, told me that they had little to complain of—that business was good. In fact, they had only recently been obliged to extend their facilities in several directions; in special machinery, new vacuum pans, more room for manufacturing and cold storage, etc. For points about the digestive ferments he referred me to Mr. B. T. Fairchild. I found him full of enthusiasm in his interest in this field of work. A short talk with him made it plain to me that however much the pepsin business is worked, the day of digestive ferments is by no means done, and I went away with the conviction that the scope of the digestive ferments is being constantly developed, and their value growing in appreciation.

"Naturally, their new predigest food, Panopticon, is uppermost in their minds just now, and from what Mr. B. T. Fairchild explained about the process and showed of the process in the various stages of manufacture, it is a real novelty in the way of peptones, and is meeting with a

large demand. Other interesting products were shown and ideas spoken of, but I must not talk out of school. We may look, I think, for more Fairchild products in the future. An interview with these people concerning the specialty in which they are interested makes it easy to understand why they are so often spoken of as 'head-quarters on digestive ferments.'

"'Pharmaceutical chemistry,' said Mr. B. T. Fairchild, 'takes a leading place in the study and practice of medicine, and the more the importance of diet and nutrition is revealed in the cure and prevention of disease, the more the use of the digestive ferments and of peptonized foods.'

"In the manufacturing department, busy among the filtering presses in the drying room, etc., I found Mr. Foster, where his natural tastes and bent are congenially employed, and make him 'the right man in the right place.' Fairchild Bros. & Foster's offices show that this firm believes in the gospel of exercise and fresh air. The walls show game trophies from every section of the country and foreign parts, from Dakota and Maine to Florida. The brothers get much amusement out of their rivalry as sportsmen. If one shows a fine buck's head, the other turns your attention to a peculiarly marked pheasant or specimen of grouse or wild turkey. Whenever possible, in the shooting and fishing season, they take a few days out of doors. They say they have to work harder to make up for it, but believe it a paying investment. Mr. Foster's hobby outside of his business, is made evident in the picture of his yacht, a Burgess forty-footer, with Mr. Foster out in the rigging 'bearing a hand.' This is suggestive of the sort of yachtsman Mr. Foster is, for he has worked his way up from the racing shell canoe and catboat to be the efficient commander, and, if need be, the practical sailing master, of a fine cruising yacht, and he takes great pleasure in handling the Lotawana in all weathers. When in commission she is kept within handy distance of the city, or near his own home on the Hudson.

"Every one knows what an active interest these people take in everything that concerns the drug business."

"Where did you go next?" asked the ever-interested clerk.

Merck & Co.

"Merck & Co., 71 and 73 William street, was our next call. There I was introduced to Mr. Theodore Weicker, a member of the firm and business manager of the company.

"What a growth that house has had!" said Mr. Phillips.

"Indeed it has. That was my first thought when I entered the building. You undoubtedly remember when Merck & Co.

established their house here. It was in 1887, although for years the foreign house had been doing some business in this country. Perhaps you don't know that when this New York house was established it was merely with the idea of facilitating the distribution of the firm's goods in this country. What a help this house of Merck & Co. has been to the jobbing houses as well as the pharmacists of this country! All over the country, no matter where you go. If you ask for certain goods, and you are told they have Merck's,

you have no need of asking further questions. The reputation of the house is unexcelled."

"I understand," said Mr. Phillips, "that when a man in our line wants information about new preparations or on some scientific point in connection with drugs he can send to Merck & Co. and they will answer him. Is that so?"

"That is quite right. Merck & Co. have from the very first been most enterprising, and that is one of the best examples of their helping the trade. They established a scientific department, and placed it at the disposal of their scientific and trade friends. A large force of intelligent men are employed for just that purpose. Now if I want any information on a scientific point all I have to do is to write to the firm and the reply will be pre-eminently satisfactory. Whether the questions are on pharmaceutical or therapeutical points, or as to the modes of administration of doses, they will all be answered. The sources of the house's information have been kept just as complete as possible. The Darmstadt house of the firm has the same excellent feature."

"Another point about Merck & Co., one for which it is also noted, is the reliability of its label. Another feature is that the house not only refuses on principle to handle inferior goods, but has done more than any other house in fighting commercial and other evils that the trade has to contend with. The abuse of names on labels has been practiced by some firms for years. Merck & Co. have always taken a firm stand on this matter, and have fought against any misrepresentation on labels. The firm was instrumental in correcting the common error of selling caffeine alkaloid under the label of caffeine citrate, for example. Further, it has always been prompt in drawing attention to the misuses of chemicals in medical practice. For instance, when it became the general practice to use salicylate of bismuth, 40 per cent., the acid kind, the house showed that the basic preparation containing 64 per cent. of bismuth oxide was the kind for medical use. In this way the house has rendered great service to the medical world. At present Merck & Co. are engaged in the coal tar-creosote fight. It believes that great harm is being done by the substitution of that article for beechwood creosote, which it thinks is the only kind that should be used in medical practice."

"Now, you must not think Mr. Weicker laid great stress on these points. I have put his chat into my own words. He simply wished to show the constant endeavor of the house to serve the pharmaceutical and medical professions. Mr. Weicker thought these professions had a right to expect such help. As he said of Merck & Co.: 'We want to do more than make a sale. We want to know that the proper article is furnished.'"

"Did you go through the office?" asked the listener.

"We did, after we were introduced to Mr. George Merck. He is the son of the head of the Darmstadt house, and has been in this country for about three years. About the office there are a few interesting things I can tell you. The most per-

fect organization exists in securing prompt dispatch and correct execution of all orders. The correspondence department is so conducted that all its work is done without delay. Six typewriters are kept busy all the time. I was very much interested in their system of stock bookkeeping, which has attracted a good deal of attention from other houses. By this system the firm is enabled at any time to state how much of any kind over 5,000 different chemicals and drugs now carried at the New York warehouse the firm has on hand, and at the same time in what subdivisions. That perfection enables the firm not only to keep stock always in the most satisfactory shape, up to requirements, and to avoid overstocking, but it also acts as a guard against possible irregularity, and keeps everything under proper control."

"Things are run systematically there."

"Yes. As I went out Mr. Weicker said: 'Mr. Hopp, we want all the druggists to know that Merck's goods can be obtained now at just the same prices as they would have to pay for any other label.'"

McKesson & Robbins.

"We had tried to so time our call that when we got around to McKesson & Robbins we should be able to talk to Mr. John McKesson and others without fear of taking them away from urgent business, but I think we should still be waiting if we had pursued that policy. You have no idea, when you stand outside of 91 Fulton street, how vast is their floor space and what an army of busy people there is inside those walls. When we entered we were seen by Mr. John McKesson, who came forward and welcomed us in his kindest manner. He showed us all over the office, and gave me quite a history of the house and of its home in Fulton street."

"To keep pace with the progress of trade and meet the requirements of an increasing business the firm built in 1855 this large warehouse between William and Gold streets. It was 50x120 feet, five stories in front on Fulton street, and six stories in the rear on Ann street, with basement, sub-cellar and vaults, making a total of nearly 50,000 square feet of floor room. The growing necessities of business and the increase in the manufacturing portion, induced them in 1879 to build adjoining and north of their old premises an edifice 50 feet front on Fulton street, extending 120 feet to Ann street, doubling their former space. In addition, they occupy an entire building and rent several lofts and cellars on the opposite side of Ann street, for boilers and engines and printing presses and for storage purposes. We went down into the sub-cellar of 91 and 93 Fulton street. It is devoted to storage. The basement is entirely occupied by the bottling department in the execution of jobbing orders for broken packages of essential oils, other liquid drugs and chemicals. The first floor of 91 and 93 Fulton street is taken up for office purposes and salesmen's desks, the bookkeeping department being on the second story back. The principal portion of the second story of all the buildings fronting on Fulton street is adapted for the exhibition of a complete assortment of druggists' sundries, druggists' fancy goods and all articles and appliances pertaining to the

business of the apothecary and druggist which require display and examination. The other floors are arranged appropriately for the packing and execution of orders, manufacturing of pharmaceutical preparations, soda water requisites, display of sponges and chamolis, which form a distinct and important department; cutting corks and manufacturing perfumes and toilet cases. The export department occupies considerable space, to meet the demands of a constantly increasing business with Central and South America, the West Indies, England, Germany, Japan and other foreign countries. They do a big trade with those places.

"We saw in one room a sponge man, all except the hair being made of sponge, and that I thought was Irish moss. At any rate, I said so, and Mr. McKesson smiled. After going around the office I had a long chat with Mr. McKesson. He said he was getting up a table showing the course of bark and quinine importations in this country for a number of years past, and other facts in regard to duties, etc. Most men have their hobbies. Mr. McKesson's hobby is the drug business. He has traveled abroad in the interest of that trade, and is quite familiar with the places of interest in Constantinople, Smyrna, Greece and most of the larger European cities. But he thinks 91 Fulton street is the most interesting place in the world."

"While at McKesson & Robbins we met Mr. W. H. Wicknam, Mr. John Oehler, Mr. Howard Kirkland and many other gentlemen connected with the firm. We had just time to shake hands with Mr. Sherwood of the sundries department. He was to sail for Europe in half an hour, so he hardly had time to say 'How d'y e do?' before he was obliged to rush out."

Lehn & Fink.

"One of our calls that day, although perhaps not the next in order, was at Lehn & Fink's, 128 William street. I know Mr. Fink and also Mr. Plaut, the junior member of the firm. Mr. Plaut was away, and so I did not have the pleasure of seeing him. As we crowded our chairs up close to Mr. Fink's he said he was sorry he could not give us more room. The trouble was that the business of the firm had grown so that there was not enough room to swing a cat in, if one desired to do such an unseemly thing, but he was thinking of extending the building in the rear, so as to get a good-sized private office. In the little office there are at present twenty-six persons working as busy as bees all day long."

"The distinguishing feature about the business of this firm is that they are druggists. Nine-tenths of the building is occupied by the drug business pure and simple. Very little room is occupied by patent medicines. There are practically no side issues, and the firm carries the finest possible selection of botanical drugs, both foreign and domestic."

"I was told that an exhibit of 553 specimens of drugs in glass tubes that the firm had at the World's Fair has been presented to the Chicago College of Pharmacy. This collection embraces all the plants and exudations official in the Pharmacopoeias of the United States, Germany, France, Great Britain and Scandinavian countries."

The firm has at present an exhibit at the Midwinter Fair in California.

"Perhaps you do not know that the firm of Lehn & Fink is regarded as an authority on new remedies and botanical drugs. It has been the leading house in the new remedy field since it was established, twenty years ago. The firm had the first ounce of salicylic acid that came to this country. From the founding of the house to the present day it has been identified with the progress of pharmacy, and it has done much work gratis for the benefit of education.

"In order to be able to tell you something about the firm's business I verified by inquiry some points I was partially posted on. They have a very fine laboratory at 33 Gold street. It is now in its fourth year, and is in charge of a graduate of the Wisconsin College of Pharmacy. It is, of course, fully equipped with the most modern apparatus and machinery. They have large storage rooms for botanical drugs at 80 Pearl street.

"There is another matter about this firm that I would like to tell you. I secured many pointers from them where I could find firms that dealt in certain things that I wanted. Lehn & Fink are very good about furnishing such information to their customers, and often do the same for people that are not customers of theirs. They are a sort of New York directory.

"Lehn & Fink have twenty-two salesmen on the road. Eleven of these are in New York city and its suburbs. The local men go as far as Poughkeepsie. One of their best men is now in Mexico and Central America. When I went out I saw a number of boxes marked ready for shipment to Champerico, Guatemala, a new port. I was also told that last week the firm sent several loads of drugs to Guaymas, Mexico. Fanny, isn't it, why those people use so many drugs?

"Although I meant to ask some questions about the matter of publications in which the firm is interested, I forgot to that time, but I was in there again the next day and made inquiries. For one thing, they publish notes of everything that is new in the remedy line. Their 'Notes on New Remedies' is now in its sixth year, and is looked upon as an authority in this special branch of materia medica. The firm also publishes Halstead's 'Modern Materia Medica,' the only standard reference book on new remedies in the United States. This book has had an immense sale."

"I should think that the firm had plenty of business on its hands," said Mr. Phillips.

"No doubt of it," was the reply.

Stallman & Fulton.

"As we proceeded on our way from Lehn & Fink's to the office of Stallman & Fulton, at 10 Gold street, I expressed a desire to go up to Central Park some day if I could get my young friend from the Era to go with me. He said he thought we could go some day early in the morning, and so we arranged a little excursion quite outside of the drug line for the next day. On reaching the office of Stallman & Fulton we went directly into the office of Mr. John Fulton, Jr., who was very glad to see us, and took us through the

building. Before we went upstairs Mr. Fulton told us something about the insect powder business, in which the firm is a leader in this country. He said that the general trade seemed to be ignorant of the fact that the adulteration of insect powder is now going on in this country to a great extent. The firm was the pioneer in the country in the uncolored powder business, having been the first to bring the flowers from Dalmatia, in 1880, powdering them here under its own supervision. The business grew from a few thousand pounds a year to the extent of thousands of kegs. This year the firm has been excessively annoyed by the adulterations that have been put on the market by unscrupulous persons. Some reputable houses are even selling powders at 17 cents, claiming them to be from closed flowers, when the flowers alone are commanding 22 cents in Trieste. This year, he said, the most dangerous adulterant is silica. Some of these alleged powders contain as high as 60 per cent. of silica. He had been much surprised that the retail trade did not notice this, as the fraud can be

clay street. That firm has a building running through to Vesey street, or, really, it has two buildings on Barclay and on the other street. We went through the first floor of the Barclay street house, noticing particularly the very large assortment of glassware the firm has on hand. Of course, what we saw was simply the show pieces, not the stock, but I don't remember having seen such an amount of samples before, that is, in that line. In the office on Vesey street we found Mr. F. M. Underhill, one of the firm, at his desk. He welcomed us cordially, and we had a pleasant chat with him about trade and the firm's lines particularly. We did not go through the stock and packing rooms, but were told all about them."

"Did you see Mr. J. H. Stead, the head salesman, and Mr. C. H. Lester, the manager?"

"Yes. I was introduced to them on our way out. You know Whitall, Tatum & Co.'s New York office has about forty or fifty clerks, and they were all busy. Mr. Underhill told me they have about fifteen salesmen on the road."

ON THE PROMENADE, BROOKLYN BRIDGE.

easily detected. All vegetable powder has a fibre, while the adulterant contains none, of course. He thought that the whole retail trade ought to wake up on this matter.

"The building of this firm is well worth a visit, as it is probably the nearest approach to being fireproof that a building can be made. It is certainly the best constructed drug building there is in the country. It is built on the principle of the Marvin safe. The floors are laid on cement. Under that are four inches of ashes, and last of all is the solid iron. The hatchways are so constructed that when they are closed the floors are just as tight as if hermetically sealed. It is utterly impossible for a fire to spread from one floor to another.

Whitall, Tatum & Co.

"Where did you go on Thursday?" was the first question asked by Mr. Phillips.

"Our first call that morning was at Whitall, Tatum & Co.'s office, on Bar-

"That's for the New York house alone, you mean?"

"Yes, of course. The Philadelphia house has its own men. The New York house must do a big business in glassware and druggists' sundries.

"When we left Whitall-Tatum's I went across the street to call at Richards & Co., Limited, where I have a friend. The firm deals in chemists' and assayers' supplies. I found my friend was out, so didn't stop there but a minute.

Charles Stern & Sons.

"Being nearby, I thought I would like to drop in at the office of Charles Stern & Sons, 14 and 16 Vesey street. That is a very large wine and brandy house that has many customers in the drug trade. Their home office is at Los Angeles, Cal. Mr. Perkins Stern was in and we made ourselves known to him."

"In what particular way is that house connected with the drug trade?"

"The wines of this firm are made with particular reference to their use by the

drug trade. They are pure wines and are guaranteed so. Their brandy, for instance, the double-distilled, is put up in ten-gallon kegs to suit the wants of our trade particularly. Their sweet wines, port, sherry, angelica and muscatel, and their zinfandel and Burgundy are used in making wine of coca. If we had had time we should have been pleased to go through their cellars."

"I suppose you did see some of their best wines?"

"To tell the truth, we received a very pressing invitation to sample some very excellent brands, but we were obliged to go on with our calls, and so we agreed to call again.

"Now I am going to tell you about my most interesting call of the week. It is interesting because it is out of the usual line and because we saw so many things that very few people have the chance or opportunity to see. It was at a call on George Lueders & Co.'s house, on Pearl street, No. 218."

"What are the specialties of that firm, Lewis?" asked Mr. Phillips.

"Olive oils, essential oils, perfumers' raw materials and fine drugs."

"I suppose the perfumers' raw materials were the things that made your visit there so interesting?"

"Yes; but you are anticipating me. Let me go ahead in the right order, and I will come to that part of it.

George Lueders & Co.

"When we reached the firm's office we asked for Mr. George Lueders, and were directed to the rear of the store. We found the head of the firm busy at his desk, but when we stated the object of our visit he dropped everything and devoted over an hour to our instruction and amusement. First of all he told us about the specialties of the firm, as I have told you. In connection with that article he told us of a case that had recently come to his attention that furnished quite a joke at the expense of the chemists. Three samples of olive oil were drawn from the same can and taken to three different chemists for analysis. The oil was the purest that could possibly be obtained. When the three reports came in one chemist said the sample contained sesame, another that he found lard oil in his, and the third said the oil was surely pure. It seems that there is a test given in a German book that is known to be entirely wrong, and the chemist who had found sesame in the oil had used this test.

"After this Mr. Lueders went to a big safe in the office and brought out two good-sized glass jars, whose glass tops were securely screwed down. He took off the covers and said: 'There is pure ambergris.' We saw a very insignificant looking lump of stuff, light brown on the inside and quite dark outside. We smelled it, but the odor was very faint and not remarkable at all. Mr. Lueders said that the piece he was showing was the very best of ambergris.

"Next, after covering, securing and replacing the jars in the safe, he brought out five small tin pans, and, lifting the covers, showed in each about a dozen objects that looked not unlike little bags made of untanned hide, with the hair still on. These, we were informed, were the sacs from the

ONE OF NEW YORK'S THEATRES.

musk ox, and contained that valuable article, musk. What a smell, so different from the musk we know. It was really a disagreeable odor these little things gave forth, and yet the small amount there was worth \$3,000. I handled some of the sacs, and for days I could smell the musk when I raised my hand to my nose. No amount of washing seemed to destroy the odor.

"Mr. Lueders told us one thing about the trade in musk ox sacs that was new to me. These sacs were from China, and are bought through a very reputable house, yet it is no unusual thing to get a number of absolutely valueless sacs in a consignment. There is no return of money in a case of this kind, and there would not be even if every sac that came was worthless. The sacs are all paid for before they are shipped from China. The way in which these sacs are tested for quality is also quite interesting. Long pins or needles are inserted in the soft part of the sac, drawn out slowly and held to the nose. You would be surprised to note the difference in odor between the various grades. Of course, all small rank, as compared with the perfume on a lady's table.

"Putting away the sacs as carefully as he had the ambergris, Mr. Lueders called us over to the safe and showed us row after row of cans containing attar of rose. Each can, he said, represented \$300. Then we went back into another room, also containing a safe, from which he took bottles of attar, some with the contents like jelly, others half jelly and half liquid."

"How I should have enjoyed the various perfumes had I been there," said Mr. Phillips.

"Well," was the answer, "I can assure you that you would not have enjoyed the civet. That was shown us in a buffalo horn, just as it comes from the Soudan. My, how rank that was!"

"We next examined some of the many photographs on the walls of the office. They show the manufacture at Grasse of pomates. One of the photos showed great heaps of violets on the floors, others piles of lavender flowers in fields, with the workmen and the heating apparatus close at hand. Direct heat is used in some cases,

we noticed, certainly in the photographs of the lavender beds. Mr. Lueders presented me with several of the largest pictures, and I value them highly.

"From the office we went up to the top floor of the firm's building and saw many interesting things on that and the floors below. There was citronella in tanks, almond oil, orris root in great bags, vanilla and tonca beans in great quantities and all qualities, and I don't know how much more. Some tins in which oils had been brought from the far East were shown. I did not see anything particularly striking about them. Mr. Lueders took one up, threw it on the floor and jumped on it. Then, picking it up, all dented in and mashed out of shape, he told us we couldn't find a break or a crack in it. Those old heathens can show us some points still, can't they?"

"In some things, I suppose," was the answer.

"We thanked Mr. Lueders warmly for his kindness in showing us over his office, and when we got out voted unanimously that the visit was the most interesting of all our calls.

Johnson & Johnson.

"Johnson & Johnson's office is at No. 92 William street. We considered ourselves very fortunate in finding the principal members of the concern at the office, for they are busy men—always engaged in the pursuit of ways and means for improving what seems to others an almost perfect business. We met Mr. R. W. Johnson, the president; Mr. E. M. Johnson, the treasurer, and Mr. J. W. Johnson, the secretary. They are all modest gentlemen, but then everybody knows that firm contains geniuses in at least two different lines.

"You perhaps know how this house of Johnson & Johnson has made an enviable name for itself wherever the physician and surgeon perform their work for the benefit of suffering humanity. The almost miraculous cures effected by means of the surgeon's knife are due, many times, as much to the reliable antiseptic dressings that bear the 'Red Cross' trade mark as to the skill of the surgeon. One is the

THE OBELISK IN CENTRAL PARK.

necessary complement of the other. The medical profession knows this. It is in this way—by furnishing goods that can be relied upon—that Johnson & Johnson has not only made fame and fortune for itself, but added to the happiness of thousands all over the world.

"If there is one point more than another that I can well emphasize in connection with this house, and it is hard to single out points when you talk about Johnson & Johnson, I had best speak of such things as will linger in your memory. You are a young man, so you want to note these things, which, if copied by you, will bring you into enviable prominence in your business. 'Absolute accuracy,' that is the great point. The system with which they do everything is another noticeable thing. The house does not simply strive to keep itself abreast of the times; it tries to get ahead of the times; to bring the times up to it. In this endeavor it spares neither expense nor industry. When it comes to the matter of inventing machinery to turn out some new line, Mr. J. W. Johnson can be depended upon to devise the needed mechanism. To hear the Messrs. Johnson talk on trade topics would be worth a good deal to the young men in our business. I have often thought it would be a good plan to get such men as the Johnsons to talk to the students of colleges all over the country. Their eminently practical views would help our young men.

"The standard of excellence of Johnson & Johnson's products is always maintained. If you buy regularly from them you know that a consignment sent you this week will be just the same in quality as the one you received last week, and the one you will get next week will be the same as this week's. Then their original discoveries in the line of trade—why, I could talk for hours about them. They have originated many things that are now used the world over. Some of these goods have revolutionized the trade.

"I took great pleasure, knowing all this, in going through the office on William street, and expressed a desire to go out to the firm's factory at New Brunswick. Mr. R. W. Johnson was kind enough to invite me to go with him. We went by way of the Pennsylvania road, taking the ferry at the foot of Cortlandt street. By the way, that bridge across West street to the second floor of the ferry house is a very handy thing. The stairs that lead to it are in the last building on the left side of Cortlandt street, and when you cross you are on a line with the upper decks of the ferriboats. That bridge saves you from worrying about crossing the street between the trucks, horse cars and other vehicles that crowd that part of West street.

"To go on, we had a pleasant ride out to New Brunswick, taking about an hour. I should think, during which time Mr.

Johnson told me how the firm's business had been built up and how much pride he and all the rest of the company took in maintaining the excellence of their products. I found the factory was alongside the Haritan River, very handy for shipping goods by water or for getting raw material right to the buildings. All goods are shipped direct from the factory, and with such facilities it is no wonder their delivery is prompt.

"We went into the bleaching-room first. The bales of cotton, just as they are taken from the steamships, have been opened, and the contents run through the machines which clear out all seeds, sticks and stones mixed with the cotton. Then the cotton goes into a boiler, and from there to the bleaching tanks. These contain a compound that does the work in great shape. His forks pass the cotton along.

"From the tank the material passes to the apron, or endless platform, which carries it upstairs to the dryer. It takes about half an hour for a particular little piece of cotton to go through this dryer. I don't recollect the names given to all the machinery, but the next operation was that making the cotton as fluffy as can be. Then the material was rolled. At first the cotton was quite thick, but as it passed in succession through machines it became thinner and thinner. At last it was down to the required size. Then on it went into other machines, each one adding a layer to the others. After passing through the last machine it is cut into certain lengths. The workman who does the cutting is so expert that he cuts off the necessary weight of cotton almost every time. Of course, the weight is afterward verified.

"I went through about every department in the factory. When you go to New York you can go and see all I did, for the trade has a standing invitation to visit the factory. In the matter of handling goods the firm is exceedingly careful. From the time a piece of cotton is taken from the bale to the time it becomes a finished product it is hardly touched by human hands. We spent some time seeing the manufacture of bandages and plasters of all kinds—so many that I would tire you if I were to tell you about each one—medicated cotton, catgut ligatures, dressings and gauzes, and lots more. But you have already got a pretty good idea of my visit, haven't you?"

"Yes, but I am going to see all that myself some time, so leave a little to be new to me," said Mr. Phillips with a laugh.

Theodore Ricksecker.

"One can't help but appreciate the value of energy, enterprise and faithful adherence to principle when he visits the laboratory, warehouse and office of Theodore Ricksecker, the perfumer. No. 58 Maiden lane near William street. I felt at home there, partly because, as you know, he is a native of our own State—Ohio. In looking around among the first-class druggists of New York city I found his perfumery up to the top, as is the case in most of the best drug stores wherever his goods have been properly shown. Whether you visit the Summer or Winter resorts, Saratoga, Newport, Jacksonville,

etc., these goods are excelled by none, and it is no wonder. He has employed at various times manipulators from the laboratories of Pesse & Lubin, London, Pinaud, Paris, and Lautier Fils, Grasse, as well as domestic talent, besides his own experience.

"He is one of those painstaking men who is determined to master the details of his business, and is content with nothing short of the 'top' position by earning and deserving it, consequently every ounce of perfumery bearing his name is compounded by himself. Having been for many years closely identified with the retail druggists of America, a member of the A. P. A. and N. Y. College of Pharmacy, he appreciates the difficulties that environ the druggists; he studies their interests and refuses to sell the dry goods trade, so that Ricksecker's goods, wherever sold, bear a legitimate profit. He has refused large cash dry goods orders repeatedly.

"The originality of his goods in all details, bottles, boxes, labels and tying, has been for many years conceded, coupled with most excellent taste. Mr. Ricksecker sees little difference between stealing another's designs, names, labels, etc., and stealing his pocketbook. He shows the various thefts of his rounded bottom bottles, labels and names by competitors, and I must say it is not creditable to the trade.

"The seven floors of the Ricksecker building were visited by us. In each department the evidence of constant progress is visible. The question, "When does Mr. Ricksecker sleep?" has been asked more than once. I can understand it now. His vacation consists in going to Montreal and working in the branch laboratory there, and his goods are held in highest esteem all over Canada.

"I'm sure it would strike you and every druggist as most remarkable to see what I saw—executed orders from almost every nook and corner of this world. I saw orders from London, Berlin, Edinburgh, Belfast, Calcutta, Honolulu, Alaska, West Indies, South America, Australia, and even Gibraltar, Rangoon, Hong Kong and Ceylon. This is an unprecedented state of affairs, due fairly to merit and work. In spite of depressed business, three of the days I spent in New York brought in orders from New York city retail druggists of 108 dozen Ricksecker's Skin Soap alone. It's a specialty well worthy its most excellent reputation, and it is sold, like Ricksecker's perfumes, on merit.

"See how Mr. Ricksecker fared at the recent World's Fair. His were the only perfumes sold on the grounds. There were also 200 slot machines scattered over the grounds with his name on them. His exhibit was given the post of honor—the first on entering the main building, and his awards were the highest obtainable. His representative kept a register, which is an interesting record, of visitors from all over the world, and embracing some of our most distinguished men, professors in colleges, artists and professional men, as well as many of the druggists who used to buy goods from him in the '60's, when he traveled for the old house of W. H. Schieffelin & Co."

Connecticut Witch Hazel Company.

"You wouldn't think that I had time on my trip to go up into Connecticut, but I did, and I had a very pleasant time and lots of carriage riding. It came about in this way. I was, of course, interested in the process of making witch hazel, and I made up my mind when I got to New York that if I possibly could I would take a run up to the distilleries of the Connecticut Witch Hazel Company, which are at Chester, Haddam and Killingworth. Well, in the course of my journeyings around New York I met Mr. E. W. Seymour and Mr. A. H. Watson, who have an office at 132 Nassau street. They control the company and take the active management of the business. I was invited up to see them and gladly took advantage of the opportunity. We naturally talked about the industry in which these gentlemen are engaged, and I was particularly impressed with what they said about their goods. They make a good, honest article, and they want the trade to know that whenever it procures goods with their mark it can get no better witch hazel. It is surprising that so many retailers make use of an alleged witch hazel that is only a weak distillate and contains a large portion of acid. These gentlemen told me that they did not think the trade was fully aware of the deception practiced upon it. If the trade-mark 'Hazel Bloom' is found on a package containing witch hazel the purchaser may know that the article inside is the best that can be bought. That mark is a guarantee of the quality of the goods.

"Finding that I was myself considerably interested in witch hazel, Messrs. Seymour and Watson invited me to go up to their distilleries, and so I agreed to go. I was fortunate in going to New York when I did, for the company was just making the last run of the season preparatory to closing the mills."

"How do you go to Chester?" inquired

Mr. Phillips. "I'm not posted on railroad routes around New York."

"Chester is a very easy place to get to. We took one of the Boston expresses from the Grand Central Station in the morning and went through to Saybrook Junction in quick time, making only one stop, at New Haven. Chester is nine miles from Saybrook Junction, and to get there we took the Connecticut Valley Railroad. Close to the station stands the large warehouse of the company, so we did not have many steps to go before we were seeing the inspection, storage and bottling of the witch hazel. This warehouse receives the product of the three distilleries, so you can imagine it is a pretty good-sized building.

"After seeing just what was done at this point we were taken in a carriage over to the Chester mill, about two miles from the warehouse. There I saw the brush ready for the stills, the brush-cutters, stills, condensing coils and all the other machinery used in the manufacture of the distillate. While I was at this mill I noticed several men looking at the machinery and at other things of interest, so I naturally supposed that like myself they were visitors to the mill. I asked Messrs. Seymour and Watson if it was their practice to allow people to enter the mill and see the method of making witch hazel. They told me that the other visitors were well-known people in the town, and that they had no objection to these particular persons looking over the mill. But if any reputable person wants to know anything about the manufacture of this firm's witch hazel all they have got to do is to make inquiries at the office and they will be answered. This firm has no desire to make people think there is anything mysterious about the manufacture of their goods."

"I like to see people like that," interrupted Mr. Hopp's friend. "It is quite refreshing to learn about their methods."

"Quite right, Tom," answered Mr. Hopp.

THE MALL, CENTRAL PARK.

"Did you go to the other mills of the company?" was asked.

"Of course. We re-entered the carriage and drove five or six miles this time. That brought us to the Killingworth mill, where old processes are used instead of the more modern ones. From there we went on for five miles to the Haddam mill, where the same kind of machinery is used as at Chester. So I had not only seen the making of witch hazel, but I had a capital ride, too, and when I returned to New York I felt well repaid for my trip."

At R. W. Walker's Office

"You remember my account of a visit through one soda fountain apparatus company's buildings? Well, we had an opportunity a few days later to inspect the offices of R. W. Walker, New York agent of James W. Tufts of Boston, and Howell & Sangston, agents for Low's Art Tile Company. The former is on Warren street, near Broadway, and is a very large room, extending back from the street a hundred feet, I should say. It is stocked full of all kinds of fountains, from small ones to big ones, and all are finished in excellent style. It was worth spending considerable time on, this show of handsome fountains, and we did make a very thorough examination of the various styles. Mr. Walker explained the method of making the Tufts fountain, and told us about the difference in cost between the many kinds.

Howell & Sangston.

"The Low Art Tile Company has its office in the Havemeyer Building, on Church street. There I met the New York agents, and, as at the Tufts office, we had a very pleasant talk about the trade and the growing disposition on the part of druggists all over the country to have the finest fountains they could buy. Messrs. Howell & Sangston have a wide acquaintance in the trade, and I found them very well posted on the condition of business in New York and the adjoining States. They told me that their business is very good, and I find that is the general opinion of the fountain manufacturers. I wish you could see some of the handsome apparatus many of the New York retail druggists have. They are beauties and no mistake.

On Brooklyn Bridge.

"I spent one whole day and part of another in seeing the downtown points of interest in the city. The first place I went to was Brooklyn Bridge, and I walked over and back, so much did I enjoy the scenes presented and the fresh air. I was surprised at the number of people who were crossing the bridge. I expected to see very many poor people walking across, of course, but not so many well-dressed men and women."

"I think that perhaps that is the way many business men who live in Brooklyn and have their offices in New York get a daily constitutional," was Mr. Phillips' remark.

"Well, if they walk across that bridge twice a day it is almost enough exercise for any man who is on his feet any time at all during the day. The view from the centre of the bridge in all directions is very attractive on a pleasant day, with the shipping in motion up and down the rivers and in the bay. Staten Island looks as if it might be just the place to live in the

THE PRODUCE EXCHANGE.

Summer time, and if they get the breezes on the slope in Brooklyn as I got them that day on the bridge I shouldn't ask for a better place to sleep in during the heated term. You know that the average New Yorker delights to make fun of his friends who live across the bridge by telling them that Brooklyn is only the bedroom of the metropolis."

"I have heard so."

"As I was going along Chambers street I saw a picture in the window of a photographer that presented the view on the big bridge almost exactly as I saw it that day, so I thought I would buy it and bring it home to you. Here it is."

"That looks like an excellent view of the promenade," said Mr. Phillips, "and I am much obliged."

"Most of the views of the bridge are taken at a distance, and that is the only one I ever saw that showed the broad walk."

Cushman Bros.

"I looked into the matter of selling goods in New York and its vicinity very thoroughly and may be able to tell you something of interest in that line. You know that many schemes are brought before manufacturers for the introduction of their goods, but after all one has to fall back upon the faithful salesman. It is not every manufacturer, however, who can afford to keep a sufficient number of men in a large market like New York and vicinity to cover it properly and to visit the wholesale and retail trade often enough to secure the results. It was this fact that first suggested to Messrs. Cushman Bros. their agency plan, which has proved so successful for the past six years. The rapid growth of this firm has certainly been phenomenal. In September, 1888, they started business in a small office at No. 132 Reade street, and in a few months they found it necessary to hire more floors in that building and in less than two years their business had increased sufficiently to warrant their taking their present quarters, an eight-story building of 30x100 feet.

"Their system is original, and certainly deserves the attention of manufacturers

who are seeking the New York market. They have two distinct departments, one devoted to the grocery trade and one entirely to the interest of the drug trade. In the latter they have a staff of eight salesmen, who are districted off on different territories in New York, Brooklyn, Jersey City and Hoboken and a circuit of forty miles. These salesmen simply offer the goods for which Cushman Bros. are agents, and cover their territories about every ten days, drumming the retail trade and turning over the orders to the jobbers. So complete is the system that storage, insurance, clerical work, cartage, labor, etc., are all provided without additional cost. In fact, the manufacturer has really established a branch house in New York without having to attend to a single detail. Reports are sent daily showing the actual orders turned over to jobbers and all goods sold. The Drug Department is under the management of Fred Fear, who has been associated with Cushman Bros. since they started this business."

"There was money in that idea, wasn't there?"

"Yes; but it takes smart people like the Cushman brothers to do the work well.

Wm. R. Warner & Co.

"I won't give the rest of our calls in consecutive order, because some days we only called on one or two houses, and spent the rest of the time sight-seeing. One day, when I happened to be on Liberty street, I dropped in at the office of William R. Warner & Co. That is the New York branch of the well-known Philadelphia house. The first person we met was Mr. Ed Fluhr, the manager of the office."

"You must have seen Mr. Lance in New York. I heard he was there while you were away."

"So I did. He was sitting at the desk near the window when we went in, and of course I had quite a talk with him. As he is the general traveler for the house, I hardly expected I should see him at the office. Mr. Fluhr regretted very much that Mr. Warner, Sr., was not here to welcome us, but he has been in Rome, attending the Medical Congress,

and has now gone to Antwerp to see about the firm's exhibit at the coming fair. He will not be home until the latter part of May.

"You know this firm is specially noted for its bromo soda, the well-known effervescent salt for headaches and seasickness, elixir salicylic comp., inulin, liquid pancreopepsin, bromo lithia and a general line of sugar-coated pills."

"Yes, I know that the firm was the pioneer in the sugar-coated pill business." "The original house was established in 1836, and the New York office was started in 1878. Now they have branches in Chicago and London. Their success has been enormous. Mr. Fluhr said that Mr. Warner frequently visits the New York office. I know him to be a very popular and genial man."

The L. Calvin Shafer Co.

"One day, on returning from some jaunt or other over in Jersey, I came over the Pennsylvania ferry, and on going up Cortlandt street saw the sign of L. Calvin Shafer Co., manufacturers of fruit juices. Going in, I met Mr. A. Doyell, the manager of the concern, who showed me through the building, in which is stored a very large stock of fruit juices. To show how much stock the concern carries, I can tell you that the company has filled an order for seventy-five barrels of raspberry juice, and never turned a hair. It wouldn't had the order been for 175 barrels. The grinding and pressing of the fruit, and all apparatus for the work of the concern, were shown me. The work was in full operation, for that day they were grinding oranges. Downstairs we found 500 barrels of fruit ready for pressing and filtering. The building is five stories, and besides the work done there, a factory in Jersey is kept going nearly all the time. Several other buildings are used for storage, both for fruit and the juices ready for the market. In 1829 the firm began business under the name of Philip Gordon. He was succeeded by I. C. Shafer, and the concern was, in 1883, incorporated under its present name. The trade extends from Maine to California, principally with the wholesale druggists. The work is all done by steam power, and the product is guaranteed for ten years' time. Everything is first class in every respect as regards the quality of the goods turned out. In concentration of flavor, making the price cheaper for the druggists, the firm admits no superior. The retailer finds the concentrated flavor much cheaper to use at his soda fountain, as you can readily understand.

Upjohn Pill and Granule Co.

"The Upjohn Pill and Granule Company has had an office in New York for four years, the head office being, of course, in Kalamazoo. We called on Mr. F. L. Upjohn, treasurer of the company, at his office, 60 Maiden lane. He told me that the Company got all its stock from the Michigan factory, and filled orders in New York for the Eastern and foreign trade. The latter has grown to quite considerable proportions on account of the firm's peculiar process of making pills—that is, so that they will keep in all climates. The trade with Mexico and South America is especially good."

"Don't the New York firms speak about

the present depression in business?" came the question from Phillips.

"I heard very little about dull times. Now Mr. Upjohn said that his business had never been more prosperous than it had been in the last three months. Trade with England and Germany had been first class, and the two local salesmen, as well as the whole office and shipping force, had been kept busy all the time.

Other Calls.

"At another time I ran across Mr. C. A. Holmes of No. 96 Maiden lane. He pushes the goods of the W. S. Merrell Company of Cincinnati, in New York and its vicinity. As we were then near his office, he asked us to drop in and have a chat, which we did. You know all about the Merrell products, so there is no need of my telling you about them. We found Mr. Holmes a very pleasant gentleman to meet.

"You know we saw a great many more stores than I have mentioned, especially the retail ones. One day we happened to go into a store to buy something, and I was looking over the sundries displayed on the counters, I saw what appeared to be straws for juleps, lemonade, etc. I asked if there was much of a sale for such articles, and was told there was considerable. 'Those are paper straws,' said the clerk, as he handed me a package. I was interested at once, being struck by their novelty and evident utility. Natural julep straws are cut green, and as they frequently dry faster on one side than the other they spring or warp, so very many of the natural straws are cracked. Moreover, if the natural straws are placed in a moist atmosphere, which is almost unavoidable in a sea voyage, they become moldy on the inside. Upon drying again the mold turns to 'must,' so that if a natural straw is not cracked and can be used at all it is almost sure to be 'musty.' On the other hand, this kind I was shown—Stone's Patent Paper

Julep Straws—all are perfect, clean, free from mold, and as they are larger than the natural straws, one straw will always suffice for a drink. I noted the name and address of the manufacturer: M. C. Stone, 430 Ninth street, N. W., Washington.

"While I was in New York you will have observed that I not only visited many drug firms, but also companies that make articles used by men in our line. I found much that was new to me in the machinery line, as well as in the fountain-making business. So when I had a chance to visit the Springer, Torsion Balance Company's office, at No. 92 Reade street, I did not neglect it. I strolled in there one day and met Mr. Albert Fries, manager of the concern. He explained the company's product to me. The Torsion balance is a compound beam scale or balance used by many chemists and druggists, as well as by grocers and confectioners. It gets its name from the manner in which the fulcrums twist or 'torse.' Mr. Fries explained that the superior features of this balance are its accuracy, durability, sensitiveness and simplified method of construction. He explained this method to me in an interesting way. The scale, he said, is indorsed by high authorities, and received a medal of superiority from the fifty-fifth National Industrial Exhibition of the American Institute, New York, 1886, and the John Scott Legacy medal and premium, awarded by the Franklin Institute, Philadelphia, 1891.

"You know, I suppose, that the New York Board of Trade and Transportation has a drug trade section, and the trade in that city finds great assistance from that body. Mr. Thomas P. Main is at the head of the drug trade section this year, and on the committee list can be found the names of representative men in our line. I saw the list in the Era a few weeks ago. The office of the section is in the Mail and Express Building, where

THE NEWSBOY'S NARROW ESCAPE.

we called one morning. By the way, I think that a very handsome building, with those great figures in front, representing Europe, Asia, Africa and America.

Nearing the End.

"I am getting down near the end of my story," said Mr. Hopp, as he consulted his watch and found the hour late. "The rest of this narrative will have to be short. One of our calls was on the New York branch of the Albany Perforated Wrapping Paper Company, at 28 to 30 North Moore street. This firm is one of the best-known concerns of the kind in the country. It is known in the drug trade, not for its wrapping paper particularly, but for its superior quality and many kinds of toilet paper. This company is the originator or some of the best-known brands of toilet paper on the market.

"The New York office of the William Budding & Son's Co., at No. 142 Chambers street, was another place where we were cordially received. Mr. Schang, the manager in charge, took good care of us and showed us the sample rooms, containing the finest kinds of druggists' and confectioners' boxes. We did not have time to go through the stock rooms.

"Of course you know a good deal about Freddy Gebhard? His father made money in the gin trade. Well, we called one afternoon at the office of F. Ruttman & Co., selling agents in this country for Mederswan gin. The first importation of that gin into this country was made by Frederick Gebhard in 1819, the gin coming over on the sailing vessel Falcon. In honor of this importation the packages still bear the initial 'G' in addition to the trade mark."

"I have wondered what that 'G' stood for," said Mr. Phillips.

"Now you know. To go on with my story. The firm that makes Mederswan gin is a very old one. Their distillery at Schiedam, Holland, dates away back in the eighteenth century, and their distinctive trade-mark, the swan, was adopted in 1816. The present house is Meder & Zoon. Mr. Ruttman became manager of a department of this agency in 1853, and upon the suspension of the successors to Schuchardt & Gebhard in 1875 Mr. Ruttman continued the agency under his own name.

"I think I have been up and down Maiden lane about forty times in the past two weeks, but just which time it was when I called at the office of Scher-

IN MADISON SQUARE.

ling & Glatz, No. 55, I can't tell, and it doesn't matter. We were shown every attention by Mr. Stiefel, the active partner. He gave me lots of valuable information about the chemicals of which the firm is the sole agent in this country. I learned considerable about rubidium, iodide, cresosol, chloral-caffeine and benzophenol. I had a very interesting call there, and was sorry I couldn't go through their whole office.

"There were lots of other places on my list to visit, some of which I was very anxious to see, such as the New York office of Frederick Stearns & Co., Dodge & Olcott, the Armstrong & Bros. Co., the big cork house, and the New York office of Clapp & Co. I know some people in most all those offices. I was especially sorry about not being able to go over to Dodge & Olcott's Brooklyn factory, as I could have spent a day there very easily had I had the time.

"I had great luck while in New York as regards fine weather. The day I went up to Central Park was a perfect one, and I must have walked many miles over those paths. I spent quite a long time at the obelisk, which was brought over to this country by Commander Goringe of the navy, W. H. Vanderbilt paying all the expenses. I was quite tired before I got out of the Park, and took in the Mall from one of the benches. Of course, I visited the Metropolitan Museum. No one ought to visit the Park without going there. I could have spent several days in that

building alone, but, you know, time is money.

"Outside of the general points of interest I have told you about, I spent a few minutes at the Produce Exchange, the Battery, the Cotton Exchange, and even managed to take a ferryboat ride to Staten Island. That ride gives one a splendid idea of New York Harbor.

It Pays to Visit New York.

"Well, I think this is about all I can tell you now. Of course, I have omitted much, but from day to day things will come up that will recall my visit to New York, and I can tell you other experiences in short chunks. The only unpleasant experience I had was on the first day I was in New York. I was coming down the steps of the elevated station at 33d street when I saw a newsboy come about as near being killed by a horse and carriage as I ever want to. My heart went up into my mouth that time, I tell you. But the boy escaped by a hair, then turned around and called the driver hard names. Those newsboys are terrors."

Mr. Phillips thanked Mr. Hopp for his kindness in detailing the trip to New York. As they parted Mr. Hopp said: "You know I said that I believed that this trip would be of great value to me. I now know it will. I have learned many things that will help me in business. Just tell all the druggists you know that a visit to New York once or twice a year will do them an immense amount of good, and that the cost is money well spent."

11. ROMAINE PIERSON, Advertising Dep't.

12. W. ESPENOR LORD, Advertising Dep't.

A Sketch of the Era's New York Office.

THE PHARMACEUTICAL ERA.

A Brief Sketch of its History and a Description of How the Journal is Produced.

The history of any successful enterprise is not without interest, and often possesses positive value through its relation of methods employed to overcome obstacles to advancement, and by reason of its presentation of facts and details consequent upon the building up of success, from which lessons of usefulness to others may be gleaned. Believing this to be admitted, no apology seems necessary for telling briefly the story of the Era, and giving, in some degree, an insight into the processes of its mechanical construction. The publication of a successful trade journal is a task of large magnitude, requiring unremitting attention to detail, as well as the exercise of business sagacity and untiring energy. There must be, as well, the faculty of justly appreciating the desires and needs of readers, and an ability to select from chaotic and heterogeneous material that which is closest and best adapted to the aims of the publication. All these, it is repeated, are factors contributing to the result—success. In a secondary direction, there are required such resources of the printer's art that promptness in publication, nicety of mechanical workmanship and taste in execution may be confidently relied upon.

The Pharmaceutical Era was established seven years ago, its first number bearing date of January, 1887. Its founders were Mr. D. O. Haynes and Dr. Albert B. Lyons, the former assuming its business and financial conduct, the latter the editorial service. The purpose of the journal was to cater to the retail drug

trade, and from its initial issue, which bore strong evidence of a thorough and wise recognition of what are the highest interests of the profession of pharmacy, this purpose has been kept constantly in mind. There was a breaking loose from what had grown conventional in drug journalism from long observance, and attention was given to each and all of the numerous branches and ramifications making the total of the drug business in America. The baby journal found friends at birth, these it has kept and increased in number with its growth. The Era was first issued monthly, containing, beside liberal advertising, thirty-two pages of reading matter, set in double-column measure, briefer type, leaded. This material was classified into several well-defined departments, mainly pertaining to the professional side of pharmacy, but with the passage of time the importance of trade and news features has been recognized and these departments extended in appropriate proportion.

During 1888 Dr. Lyons, because of impaired health, found it advisable to return to the more propitious and healthful climate of his native land, the Hawaiian Islands. Therefore, severing his connection with the journal, he sailed for Honolulu, his interests being purchased by D. O. Haynes, who has since been sole proprietor and general manager. At the same time the editorial supervision became vested in the management yet retaining it.

As hinted, the progress of the Era was continual, and so abundant that in the same year (1888) it was found necessary to issue a supplemental publication, christened the Era Supplement, to present purely trade and news matter. This supplement, later called the Trade Edition

of the Era, and issued alternately with the Era, rapidly increased in size and importance from its sixteen pages at the start, until, at the close of 1890, both editions, having become of such considerable size, were merged into one semi-monthly journal, which should combine the features of both, and minister still more completely to the wants of the trade.

It is hardly necessary to relate the successive steps which have brought the Era to its present form and position. Suffice it that with each issue some change has been deemed judicious, in material and make-up, and in both advertising and reading features the record has been one of continual increase. From the thirty-two reading pages per month in 1887, the number has now reached forty-eight in each semi-monthly issue, and frequently this number has been added to in order to accommodate some special feature, timely tale or important news report. Readers are familiar with the Era of today, but a few statistics may not be amiss. Taking but the first half year of 1893, we find there were of reading pages alone 576, presenting over 900,000 words, in solid nonpareil type, set in three columns, and embellished by nearly 200 illustrations of pertinent application. The index shows that over 2,100 topics were considered. A simple mathematical computation discloses that each yearly volume contains more than half a mile of original and selected reading matter, and the amount of paper employed in the production of the Era for one year, if cut and pasted into a strip the width of a column, would encircle the globe over seven and one-half times.

The advertising and subscription patronage of the Era have been not merely

liberal, but phenomenal, as indeed it must have been to render possible the attainment of its present position. It is in commemoration of the point in its history where it has been considered wise to change its base of operations from Detroit to New York that this special MOVING DAY NUMBER was conceived and is presented. It is a timely opportunity to describe the operations necessary to the mechanical production of such a publication, for we know that such a tale will be appreciated by the many who have but a faint conception of what is implied by "making a paper."

The story is simple, involving consideration of but two points—what to print, and how to print it.

What to print. To print anything, pro-

good paper, and this must be effected largely in the editorial branch, working, too, in harmony with the business department. In providing reading matter, plans must be laid far ahead. The editor must have a broad and fair conception of the circumstances and desires of his readers, and know and correspond with the leaders in thought and action, the writers and practical men, in the profession. From them is secured material of standard character, and it must always be seen that this be secured sufficiently in advance to provide a stock of material to form the body of each issue of the paper. In this line comes the relation to news correspondents, who must be kept constantly instructed, and whose letters must be prepared and sent with clock-like reg-

ularity. The host of exchanges are read with reference to their value as copy, and clippings and abstracts made from them and classified into appropriate departments. Beside current publications, a comprehensive working and reference library is in constant service to answer the thousand and one queries conveyed to the editor, some of these necessitating (in the Era) considerable practical chemical and pharmaceutical experimenting and testing for a satisfactory reply. A filing cabinet is an essential, wherein are kept odds and ends of information for frequent service. The leading current topics must be intelligently and intelligibly discussed editorially, requiring no small de-

gree of familiarity with affairs of the trade. Market and trade reports, original and selected papers, news letters and reports, editorials, trade articles, all must be prepared and ready on certain specified dates, for, like time and tide, the printer waits for no man. But, though knowing what is to be printed, much remains to be done before "copy" goes to the printer. All must be "edited." No paper, no matter how well educated and posted a writer, but requires alterations. News letters must be cut down or rewritten, a paragraph inserted or deleted, punctuation, spelling and diction revised, and the whole marked with those mysterious hieroglyphics which to the printer are plainest directions for kind of type, paragraphing,

Machine Composition for The Pharmaceutical Era.

vision must be made to pay the printer, and in a journal of this magnitude this provision must rest largely in advertising patronage, for it may be said that the income from subscriptions is considerably below the necessary amount. Therefore, a carefully selected corps of business representatives work in harmony and closest touch with the home office to secure this advertising support, while subscriptions come through many channels. It must be remembered that neither subscribers nor advertisers can be gained unless the paper be a good one; and the better it is, the more support from each. A good rule, which works both ways. Really, then, the essential to success is to make a

ularity. The host of exchanges are read with reference to their value as copy, and clippings and abstracts made from them and classified into appropriate departments. Beside current publications, a comprehensive working and reference library is in constant service to answer the thousand and one queries conveyed to the editor, some of these necessitating (in the Era) considerable practical chemical and pharmaceutical experimenting and testing for a satisfactory reply. A filing cabinet is an essential, wherein are kept odds and ends of information for frequent service. The leading current topics must be intelligently and intelligibly discussed editorially, requiring no small de-

and general style. In the Era office the major part of the copy is transcribed by the typewriter, and on paper of uniform size.

So much for what to print, now how to print it.

The copy goes to the compositor, to be put into type. All matter for the reading pages of the Era is now set by the type machines of the Mergenthaler Linotype pattern, and the half-tone illustration shows a number of these machines at work on Era copy. They are costly and elaborate pieces of mechanism, their practical operation being of fascinating interest. The operator plays upon keys similar to those of a typewriter. For each key

struck a matrix or mould of the letter, punctuation mark or other desired character, falls down into place, until, when a line of these matrices is completed, molten type metal is flowed over it, quickly hardening into a solid "slug," type high, bearing upon its face the letters (reversed) composing the line, and ready to print from. One man can set these matrices and cast the slugs from five to seven times as rapidly as the ordinary compositor can set by hand. This method of composition has several advantages; the letters are never "turned" (upside down), the printing face of the type is always new and clean, and beside being very rapid, there is no "distributing," for after being used the metal is simply remelted.

"make-up" man to serve as his instruction. He takes the type, now corrected, arranges it into pages like the dummy, and takes proofs of them, which he sends to the editor for revision and approval. This done, the pages of type, in sets of eight or sixteen, are arranged on the "imposing stone," and locked up in a "chase" (a rectangular frame of iron) in such a manner that when an impression of the form is taken upon a sheet of paper, the pages, upon folding the sheet, will be brought into consecutive order.

The form is now sent to the press room (see illustration) and placed upon the bed of the press, where it must be so arranged that in printing the impression will be uniform, that is, the ink must be evenly distributed on the paper. In other

in a way to increase or diminish the pressure as needed. Before the presses begin to turn, "press proofs" of the form are sent for final approval. When half the necessary sheets have been printed upon one side, they are turned over, turned end for end, and again passed through the press, being, by a revolving disc, cleanly cut in half on the way. Thus each half sheet carries the impression of all sixteen pages, and later can be folded for binding.

In the Era work, time is found for the preparation of a complete alphabetical index of contents, which is placed in type and, at the last moment, dropped into a reserved place in its appropriate form. The cover, printed in colors, requires two impressions. The red is first

Press Room of the Pharmaceutical Era.

When the copy is all set, and the slugs gathered into "galley," proofs are taken and submitted to the proof-reader. When an error is found in a line, the whole line must be reset, for it is in the form of a solid slug and a single letter cannot be altered. After this reading and correction, duplicate proofs are sent to the editor. Here one proof is again read and returned, the other being reserved for use in making a "dummy." These duplicates are trimmed and pasted in such a way that a complete copy of the Era is produced, showing the arrangement and appearance of the number to be printed. The dummy includes both advertising and reading pages, and is now sent to the

words, the entire printing surface of the form must be made of an absolute equality of plane, not as gauged by the straight-edge, but as regards the force and depth of the pressure exerted. The broad, flat printing surface of display letters must be made to equalize in printing pressure that of the light hair lines; the shaded, dark portions of a cut harmonize with the light. To do this requires the "make ready," consisting of "overlaying" and "underlaying." These operations embrace pasting layers of tissue paper (from one to half a dozen, as necessary) under the type or upon the surface of the cylinder which carries the sheet of paper through the press and against the type,

printed, the blue then put on, great care being taken to preserve the "register," so that one color may not be superimposed on the other. The illustration gives a partial view of the press room, with presses in operation.

The large stacks of printed sheets are now, after drying, ready to be sent to the bindery. Here they are folded by machines and by deft-fingered girls, another set of girls "gathering" them into complete copies, they are then stitched with wire on the stitching machine, next the cover is glued on, and finally they go to the cutter, who trims the uncut and rough edges, turning out the finished copies as our readers know them. For a

Folding and Binding the Pharmaceutical Era.

few months past, the Era has received an added finishing touch from the punching machine, which perforates the copies in such a way as to render it easy to place them in temporary binders furnished to subscribers who desire them. A fair conception of the operations in the bindery just described may be gained from the illustration.

But the work is not yet completed. For days the mailing department has been preparing the wrappers, which are divided into piles for the different states. A copy of the Era is now folded into each of these wrappers, the packages placed in mail bags and sent to the postoffice. Here Uncle Sam takes charge of them and quickly distributes them to the four quarters of the land, the subscriber in California receiving the welcome visitor nearly as soon as he in Maine has torn the wrapper from the journal for whose preparation and production the just described minutiae of careful detail are requisite.

This is the story up to the production of the present number. The next issue will find the Era installed in its new offices at 105 Fulton street, New York, a view of which is shown at the head of this article, and with every facility to meet increasing demands and to advance in the good graces of the trade by further meriting their favors.

Our aim is to make the Era the most complete and valuable of all the drug journals.

NEWS COMMENT.

Miss Frances A. Noyes, who for some time has been conducting a drug store in Lansingburg, N. Y., died in that city April 4.

A young man in Potsdam, Pa., when recently visiting Philadelphia found in the person of a druggist there his own father, whom he had not seen for twenty years.

Charles A. Rapelye, who has served six years on the Connecticut Board of Pharmacy, retires June 1, to be succeeded by Philo W. Newton.

Dr. S. L. Smith has purchased the pharmacy in Binghamton, N. Y., long owned by W. E. Williams. The latter is going to engage in other business at Reed City, Mich.

A drug store at Butte, Montana, was robbed recently of \$35 worth of hypodermic syringes and morphine, presumably by morphine fiends. As a provision for securing future supplies, the money in the cash drawer was also taken.

Glasgow & Lytle, druggists of Washington, Ia., are thoroughly renovating their store and will embellish it with a handsome Matthews fountain. Druggist J. H. Stewart, of the same city, is taking a well deserved vacation, visiting in California.

D. A. Hossier, a druggist of Pittsburg, while recently in attendance at the meeting of the Masonic fraternity at Alliance,

O., was held up one night by footpads, but through desperate resistance succeeded in keeping his valuables and sustaining no injury.

Frank W. Dean's new pharmacy at 138 Main street, Binghamton, N. Y., has been fitted throughout with shelfware and show bottles from Whitall, Tatum & Co., and boasts a new Lippincott fountain, supplied with the recently introduced detachable syrup jars.

C. E. Horton, for six years past connected with the Beeman Chemical Co., of Cleveland, has purchased the C. W. Biggs pharmacy at Elmira, N. Y. After his long service in traveling, he has come to the conclusion that New York state is the Garden of Eden.

H. W. Williams & Co., wholesale druggists of Fort Worth, Tex., who recently suffered destruction of their establishment by fire, have purchased the Meyer Bros. stock at Dallas. This will be added to their other supplies, and they expect to resume business very shortly.

A Louisville druggist who recently purchased a new proprietary mixture called pepsin whiskey, asked the city attorney if its sale would be in violation of the license regulations. He was told that he could sell wine of tar, wine of pepsin, wine of coca, and other similar preparations without a license, but pepsin whiskey was different. A case of whitecedum and tweedledee.

NEW YORK.

New York, April 18.—"The Era is coming to New York. It is a wise move. New York is the commercial metropolis of this country and the Era should be here. It is welcome."

Such is the tenor of all of the kindly expressions of drug trade men on the Era's move to this city. The New York business man is very proud of his city and he likes to see other people not only agree with him in word, but show by action that they believe he is right. So there was a double pleasure in the words of welcome they extended to the Era.

J. D. Titsworth: "It's a good thing for the Era and for the drug trade."

G. M. Howell: "The Era is an enterprising journal and it will find a hearty welcome here."

John W. Cox: "I knew he would have to come. Detroit is too small. It's only a question of time when they'll all get here."

Joseph Toy: "I shall be glad to welcome Mr. Haynes and the Era. They will be valuable additions to the drug trade here."

Edwin F. Jones, agent for C. H. Bangs: "It is a good thing. I am satisfied that the Era is one of the best drug journals published."

T. R. L. Loud: "I am sure that New York is glad to welcome such an enterprising man as Mr. Haynes and such an enterprising journal as the Era."

Howard Kirkland, of McKesson & Robbins: "I am glad the Era is coming here and that its moving day number is to show such evidences of prosperity."

"I am glad that the Era is coming here," said John Oehler of McKesson & Robbins, "for New York is the city of this continent. The Era is coming to the right place."

Henry B. Platt: "All bright men and prosperous journals get here finally. I am glad to hear that Mr. Haynes and the Era are coming and I wish him and the paper lots of luck."

Theodore Welcker, of Merck & Co.: "The Era's coming here shows good judgment. Brother Haynes may be assured that he will be welcomed. We like to have him here with us."

J. A. Sangston, of the firm of Howell & Sangston, agents for Low's Art Tile fountains: "I value the Era highly and believe that its move here is a good thing for the journal and the trade."

John M. Peters: "It seems to me that the metropolis is the only place that offers sufficient field for the amount of enterprise Mr. Haynes possesses, and I am only surprised that he has not located here before."

F. W. Koch, of Lehn & Fink: "It is the best move the Era could possibly make. I think the Era belongs here and should have been here long ago. It will stir up the other drug journals and be a benefit all around."

Thomas F. Main, of Tarrant & Co.: "I am glad to learn that the Era is coming here. The Era has always been a bright, readable journal and I think it will extend its sphere of usefulness by coming to the metropolis."

E. A. Sayre of Seabury & Johnson—"There is only one New York in the country and it is the place for such live trade journalism as is represented by the Era. The Era is welcome. I wish it every success in its new undertaking."

Brent Good: "I think it's the best move that could possibly have been made. We need to have a little competition here, for it will give us more and better news. The Era will not be second in the race if the present motive power behind it remains with it here in the foggy east."

Paul Monlun, of Charles Blanc & Cie: "I compliment the Era very highly on the move. I very seldom say anything of this sort so you may know that I am sincere. To my knowledge the people who take the Era read it very thoroughly and that is one of the reasons why it is valuable as an advertising medium."

Alfred H. Mason, of Seabury & Johnson: "I am glad we are to have the Era here. I suppose that the western folks are just as sorry to have the paper leave there as we are glad to have it come to New York. The natural law of gravitation accounts for the move. We are in touch with everything here and the Era will find it much better to be close to the New York trade."

G. W. Hopping, of Seabury & Johnson: "The Era is responsible for the loss of much time in the offices of this city. I hope Mr. Haynes will not make the paper any more attractive, for then we shall have to spend more time even than we do now reading his excellent paper. Seriously, I do think he has made a very wise move. The Era has made an enviable name for itself and its friends in the west must regret its change to this city. Their loss is our gain."

Johnson & Johnson have every reason to feel indignant at the proposed passage through the national house of the act which is supposed to protect the insignia and the name of the National Red Cross Association. They assure everybody that they are just as much in favor of giving the Red Cross society the protection it needs as any members of the society are, but they do not believe that the destruction of their or any other firm's business through the passage of a ridiculous and, as they believe, unconstitutional bill is necessary in order that the society may live and do its work. The bill proposes to visit the most unusual punishment on men and firms who were in business and using the sign of the red cross as a trade mark long before the society was recognized in this country, if its provisions are violated. Trade marks which are worth millions of dollars, and what is more valuable, are guarantees to the men who are engaged in the relief of the same people the society aids, the sufferers from disease and injury, are to be taken away from their owners. The government, it is suggested, might as well confiscate a man's personal effects as to rob him of the symbol by which he has made his products known to the world, by which he has built up his business and by which he has secured an enviable name for those articles which often save the lives of those near to death. More than this, the bill is condemned for that particular clause which says that any firm now using the red cross as a trade symbol may "on payment of not less than \$500" secure permission from the Red Cross society to use the symbol. This privilege of dickerling in the matter is characterized as an outrage, as it seems to force persons now using the trade mark to contribute to the support of the society. At the office of Johnson & Johnson the Era correspondent was

shown more trade marks than he can remember which bore the symbol of the red cross. Besides those of the firm, and they have on hand \$25,000 worth of labels, there were red cross labels of Swedish firms who make matches, lard refiners who do a big trade with South America, wine merchants, chocolate manufacturers, and scores of others. Then there were the kinds of labels which very frequently come over in boxes sent to the consulates of England and Switzerland. The flags of those countries, as well as of Canada, South Australia and India all bear the red cross and the United States might find a pretty muss on its hands if it tried to confiscate the contents of boxes sent to the consuls of those countries. To sum up the objections to this bill the strongest word the sufferers can use is that it is "robbery" and they do not believe a test case as to its constitutionality would get far without being thrown out of court. Johnson & Johnson propose to fight the bill tooth and nail and they are leagued with the other firms in all lines of trade who would suffer by the bill, in their efforts to prevent the measure from being passed.

Edward Evans, of Evans, Sons & Co., the largest drug house in England, arrived in this city on the Majestic on Thursday morning. He is now stopping at the Windsor, but in a few days will proceed to Boston and later go to Montreal. He was met at the White Star line pier by Alfred B. Evans, manager of the Montreal house of the firm, who will go on to Boston with him. Edward Evans is a popular gentleman. He combines all the excellent qualities of the typical Englishman with the vim and dash of an American. He is prominent in English politics, being chairman of the Liberal party organization in Liverpool and is of course a warm adherent of Mr. Gladstone. This visit is practically a business one, matters connected with the conduct of the Montreal house calling him here. One matter of special interest in which he is to be consulted is the appointment of Thomas A. Hedley, F. C. S., by the Montreal house to be the representative for the sale of their specialties in the United States. The Montserrat Co., Ltd., will be given special attention by Mr. Hedley. He has heretofore had charge of the Evans laboratory in Montreal, but will soon make Boston his headquarters and home. Alfred Evans, by the way, is to be congratulated on his approaching marriage to Miss Cassilis, of Montreal. She is very beautiful and occupies a high position in the social world of Montreal.

A retail druggist, while in a William street drug house the other day, was asked how business was with him in the month of March. He made a statement that was surprising to many of those who heard it. He said that his business had fallen off \$500 in that month as compared with March, 1893, and yet he did not seem to be discouraged. A retail druggist who can look pleasant under a loss of nearly \$17 a day for a month as compared with the same month the year previous must have done an immense business in 1893. There are not many retailers who could stand such a loss. This matter naturally leads up to the condition of trade so far this year. It is the general opinion that 1894 has so far been a very poor year if it is judged by 1893. Everybody speaks of a decline in output. A city salesman for a large

house says that for him March was a fairly good month, being better than February. He always looks for good business, however, in the third and fourth months of the year.

The battle for supremacy in the tournament of the Wholesale Drug Trade Bowling Association will be worth seeing. In all probability the deciding games in the tournament will be bowled at the Tremont Hotel alleys, 663 Broadway. Whether Whitall, Tatum & Co.'s, Dodge & Olcott's, or Parke, Davis & Co.'s team wins there will be a glorious end to the season's sport and the winners will receive the congratulations of everybody. The game of last Saturday was won by Whitall, Tatum & Co.'s five, the score being as follows: McKesson & Robbins, (bowlers): Timken, Oehler, Burne, Welsch, Schuster; total, 577. Whitall, Tatum & Co., (bowlers): Burgtorf, Diltman, Leater, Mannion, Tamlyn; total, 736.

Scorer, E. A. Olin, of Dodge & Olcott, and W. G. Ahern, of Parke, Davis & Co. Umpire, W. H. Howe, of Dodge & Olcott. It is of course too early to talk about the next-year's tournament. It is said, however, that there is a question whether McKesson & Robbins will enter a team.

The Charles E. Hires Co., of Philadelphia, has rented 116 William street.

Business in the brush line is picking up, according to the Dehame-Delettre Co.

There will be a meeting of the N. W. D. A. committee for organization on April 19.

Frank A. Ruf has gone home to St. Louis. He says that business is first-class.

E. S. Read, of Atlantic City, has put in a large and very pretty Low art tile fountain.

W. A. Hover, of Denver, has been seen by many friends in this city during the past week.

T. R. L. Loud, of Merck & Co., will be seen by his out-of-town friends in a week or ten days.

Henry Wimmer, of Gates and Sumner avenues, Brooklyn, is making extensive alterations in his store.

J. A. Sangston, of Howell & Sangston, has been visiting Philadelphia and some of the New Jersey cities.

Peter Lance, the genial and popular salesman for W. H. Warner & Co., has been in town for a day or two.

Alfred H. Mason, of Seabury & Johnson, will be a guest of the St. George Society of Philadelphia on the 23d of April.

A. Amend's store at the corner of Eighth-first street and Eighth avenue, is said to be one of the finest, if not the finest, in this city.

J. Summerfield, formerly in business on Gates avenue, Brooklyn, is now manager of Vincent's pharmacy, corner of Lexington and Sumner avenues.

Maj. "Jack" Rogers, of Evans, Sons & Co., of Montreal, was in town a few days ago with his bride. He and his bride were entertained by Mr. Brent Good.

Mr. Scatteredgood, of the Philadelphia College of Pharmacy, is now night manager of Wilson's pharmacy at the corner of Broadway and Thirty-fourth street.

The Alumni Association of the Brooklyn College of Pharmacy will hold its second annual entertainment and reception at Robinson's Hall, corner of Gates avenue and Irving Place, Brooklyn, on Tuesday evening, April 17, at 8 o'clock.

Brent Good, of the Carter Medicine Co., went to Chicago recently to prosecute the three men indicted and arrested for counterfeiting Carter's Little Liver Pills.

H. Zipp will remove his pharmacy from the corner of Putnam and Sumner avenues, Brooklyn, to more commodious quarters at the corner of Madison street and Sumner avenue.

Mr. Queeny, of Merck & Co., has already made many friends in this city, although he has only been here a few weeks. His St. Louis friends will be glad to know that he is as well as ever.

They are fitting up that showcase at Tarrant's with the brushes, etc., recently sent over by Hlndes, Ltd. When the arrangement of articles is completed the show will be worth dropping in to see.

J. Kirnan has bought the Lexington avenue pharmacy, at the corner of Lexington avenue and Thirty-first street, in the city and will remove it to the corner of Franklin and Lexington avenues, in Brooklyn.

Boney's pharmacy, in the Abbey Theater building, will be fitted up in the very finest style. C. H. Bangs will do the woodwork part of the furnishing and expects to finish his work on or about the 25th of May.

There has been a general ripping up and rearrangement of things in the Astor House drug store on the corner of Broadway and Vesey street. When the repairs are completed the store will have been much improved in looks.

Tsheppe & Schur, who have three stores at present, will probably purchase a fourth one soon. It is located at the corner of Columbus avenue and Ninety-fifth street. The concern is a big one and bears an excellent reputation.

R. W. Walker, New York agent for James W. Tufts, has just returned from a visit to the factory at Boston. He says that they have more orders than they can fill. The particular call just now is for the fine onyx apparatus.

George J. Seabury, of Seabury & Johnson, has left for Hot Springs, accompanied by his eldest daughter, Miss Rena. Mr. Seabury has been a hard worker on the Republican committee of thirty and finds that he needs a couple of weeks' rest.

Edwin F. Jones, agent for C. H. Bangs, reports that business in the fixture line is picking up in great shape. He has to work up to 10 and 11 o'clock at night. He says that for two or three months this winter, however, trade was practically "dead."

Emil Utard, manager of Ed. Plnaud's office in this city, went to San Francisco about a week ago. Besides many cities in California Mr. Utard will visit Chicago and some of the other large western cities on his way back. He expected to be gone about a month.

One sees John Oehler, of McKesson & Robbins, and Mr. Ungerer, of Colgate & Co.'s chemical department at the little restaurant, on the corner of Fulton and Dutch streets, which was mentioned as quite a gathering place for drug trade men in the last issue of the Era.

The German Apothecaries' Association of New York, numbering 200 members, has decided to publish its own official organ and the initial number, in German text, may be looked for shortly. This journal will be under the management of Messrs. E. C. Gotting, Victor Kotska and Dr. Mettenheimer.

Mr. Hoffman, for many years local representative for Elmer & Amend, is about to sail for Europe with his family. It is said that it is his intention to stay there permanently. Mr. Hoffman is one of the quickest salesmen in this city, and his hold on the trade is a big one.

James S. Cushman, Jr., of 172 Ninth avenue, has taken the agency of the Beach & Clarridge Co., of Boston, for the states of New York, Pennsylvania and New Jersey. Mr. Cushman will make his headquarters in New York, and will be pleased to call upon his friends in the trade and those that are interested in extracts and fruit juices.

H. W. Jarchow, very prominent among the German druggists, as violincellist, and Peter Scherrer, well known in the mineral water trade, as base violinist, represented the drug trade at a well attended concert of the Amateur Sextette Club at the Lexington avenue assembly rooms on Saturday, April 7. This club has a considerable hold on the drug trade men of this city.

"Perry's in the Sun" and "Terry's in the World" continue to be very popular with the newspaper men, and "Charlie" is the same agreeable man he always was. Prosperity has not made him a better fellow, because that is impossible. The newspaper man who doesn't know him is new to the business. D. Graeven is still the manager of the pharmacy in the Sun building and J. Batchelder is day manager of the World store.

An old time druggist of Brooklyn passed away last week in the person of Henry P. Morgan. In 1836, when he was 14 years old, he became clerk for his uncle, William Morgan, who was a well-known figure in the drug business in Brooklyn. The uncle died in 1850 and Mr. Morgan took charge of the business, carrying it on with success until 1867, when he retired to enter other fields of wider opportunities. He became a prominent banker and was interested in many public institutions in the city of churches.

There have been many new drug stores started during the past two or three months up on the west side between Sixth and Ninety-sixth streets. The striking thing about all these stores is the elaborate manner in which they have been furnished. The neighborhood is such, however, that the druggist could not do anything but fit up his store in first-class style if he hoped to command any considerable trade and cut a figure with his competitors. That section of the city is not overcrowded with druggists.

Bell, Pollitz & Co., importers of drugs and mineral waters at 2 Platt street, have disagreed and want a dissolution of the firm. Davis & Kaufman, representing James Pollitz and Alexander Nielson, two of the partners, applied to Judge Gildersleeve of the Superior Court, for the appointment of a receiver in an action brought against Harry W. Bell, the other partner, for dissolution. It was alleged on behalf of the two associated partners that Mr. Bell had overdrawn his account \$2,000 more than he was entitled to and that he also had threatened to sell the merchandise at prices that the other partners thought were ruinous. The firm is perfectly solvent, the inventory on December 1 showing assets as \$15,500 and liabilities as \$6,100. The judge appointed Clifford Boese as receiver.

Alonzo Dargan, of Tarrant's, was perhaps more interested in the recent trouble

in South Carolina than any other New Yorker. The mayor of Darlington, W. F. Dargan, mentioned daily in the dispatches, is his first cousin. The chief of police, A. E. Dargan, is his brother. Another brother is the trial justice who first passed upon the issue of warrants. Corporation Counsel E. Keith Dargan and ex-Congressman G. W. Dargan are also first cousins. With all these relatives concerned in the "war" it is no wonder that Mr. Dargan read the daily papers with avidity. He is well posted on the inside details of the trouble in the state and can give some very interesting stories of the rise of Tillman and the cause of the governor's hold on the farmers of the state.

A remarkable experience was that undergone by John F. Aubrey, a retired druggist of Brooklyn. He left his home, 815 De Kalb avenue about four weeks ago and was not seen by his family until a week ago, when he was found wandering about the streets near his home. During the weeks of his absence from home he had been in California, but just where he went he is unable to say. He does not know why he left home, but says that some men put him on a train at Jersey City and the next thing he knew he was in Los Angeles. He had \$1,000 with him when he went away and brought back \$600 which fortunately had been sewed up in his pocket. When he left his hair and mustache were black, but when he returned they were well streaked with gray. The physicians say that he will be all right in a few days.

The forty-first meeting and dinner of the Paint, Oil and Varnish Club was held on the evening of April 12 at the Broadway Central Hotel. John A. Elmendorf, of Edward Smith & Co., presided and about thirty-five gentlemen were present. An excellent dinner was served at 6 o'clock, after which the secretary and treasurer, W. B. Templeton, presented his report, which was accepted and discussed. He reported a balance on hand of \$1,600, a higher amount than at any other time in the history of the club. He also reported an increase of members, there now being seventy-five on the list. Prof. D. L. Elmendorf, a son of the president, then entertained the members with a lecture entitled "A zig-zag journey," illustrated with very fine stereoscopic views made by him during tramps through the old and new worlds. He was loudly applauded and cordially thanked by the members.

Will Saunders, of Vallejo, Cal., has just commenced a two-years course of study at the State University of Pharmacy.

A. D. West, for a number of years with the Butte pharmacy, has accepted a position with the D. M. Newbro Drug Co. as traveling representative for Montana, Washington, Oregon and other western states.

Mr. Wilson, who has been for some time clerk in McKown's drug store at Livermore, Cal., went down to San Jose for a vacation and also to obtain another position, as the new combination in the firm of McKown & Mess no longer requires his services.

Our aim is to make the ERA the most complete and valuable of all the drug journals.

BOSTON.

Boston, April 22.—At the March meeting of the Boston Druggists' Association President Babcock, who is a believer in the idea that a little fun may be combined very profitably with business once in a while, read a sketch entitled "The Chemist's Cat." It was suggested by one written more than half a century ago, and published in London Punch, and it created so much amusement that it seems worth the while to reproduce it for the benefit of those who missed the pleasure of hearing it read at the meeting. Probably the story will remind many of C. H. Hoy's play, "A Rag Baby," in which an amiable bulldog figures conspicuously whenever there is a doubtful prescription to be tested. [See page 435.—ED.]

Among the interesting information packed in between the covers of a new state document entitled "Manual for the Use of Boards of Health," there appears the following official definition of the word "drug," in an act relating to the inspection of foods and drugs: "The term 'drug' shall include all medicines for internal and external use, antiseptics, disinfectants and cosmetics." The document goes on to state that a drug shall be deemed to be adulterated (1) if, when sold under or by a name recognized by the United States Pharmacopoeia, it differs from the standard of strength, quality or purity laid down therein, unless the order calls for an article inferior to such standard, or unless such difference is made known or so appears to the purchaser at the time of such sale. (2) If, when sold under or by a name not recognized in the United States Pharmacopoeia, but which is found in some other pharmacopoeia, or other standard work on materia medica, it differs materially from the standard of strength, quality or purity laid down in such work. (3) If its strength or purity falls below the professed standard under which it is sold.

Dealers are obliged to furnish state analysts with samples of drugs when payment is tendered, and if they hinder such officers in the performance of duty, a fine of \$50 may be imposed. It is also provided, that "whoever fraudulently adulterates, for the purpose of sale, any drug or medicine, knowing the same to be adulterated, shall be punished by imprisonment in the jail not exceeding one year, or by fine not exceeding four hundred dollars."

When it comes to traffic in poisons the Massachusetts law demands that whoever sells poison of any kind without a physician's prescription shall keep a record of such sales; this record to be open to inspection by police officers. Now, druggists do this, of course; but although "Rough on Rats" is specially mentioned among the articles which may be sold only in case a record is made, it is doubtful if the corner grocery pays any heed to this law. Let a druggist be careless or indifferent and everybody is ready to pounce upon him, but his neighbor may dispose of quantities of rat poison without much fear of being called to account. Truly, law is a queer thing.

One wise provision in the Massachusetts statutes—perhaps it is so everywhere—relates to labels of red paper, with large black letters, to be placed upon every box or bottle of poison sold. Poison, it says; and then follows an antidote for the drug,

if there be any, besides the name of the seller.

These notes are but a fragment of what might be written about the document in question. Perhaps it would be well for the druggists in Massachusetts to send to the State House for copies of the manual.

In rather an obscure corner of the city there is now being carried on an industry which may in time become one of considerable importance to druggists. At 241 Cambridge street, Mr. Thomas C. Riley has established on a modest scale a plant for the manufacture of glass soda-water fountains, and a visit to his workshop shows that his products certainly possess some distinctive features which can hardly fail to attract attention and arouse a desire to investigate. Mr. Riley uses the best heavy plate glass. Before the parts of the fountain are put together this glass is etched on one side, and skillful workmen then fill in the depressions made with gold and silver, mother-of-pearl, and a variety of bright colors until, viewed from the other side, the sheet of plain glass seems to have been transformed into a beautiful painting. It will readily be perceived that the possibilities in this direction are almost limitless, as they are when an artist stands before his canvas, brush in hand. Thus far Mr. Riley has made Venetian scenes chiefly, but for minor decorative purposes beautiful representations of autumn leaves have been used to good effect, the designs being tasteful and the colors rich and brilliant. One can fancy how inviting a fountain might be made to appear in summer if some scene from the frigid north were displayed. But this is merely the aesthetic side. When one considers the practical, it is found that the refrigerating apparatus is of an excellent pattern, that the glass can be easily kept clean, and that the front and sides can be removed by a simple operation, or renewed in case of accident. Certainly these fountains will attract much attention from the novelty attaching to them, and Mr. Riley is confident that they are soon to come into general use. One man who has been using one has duplicated his order.

Although the State Board of Pharmacy was promised that the rooms allotted the members in the State House annex should be ready by January 1, the date of occupancy appears to be as far off as it was months ago. It is a pity that a commission which applies itself so faithfully to its important work should be disappointed and hampered in this matter. However, when the headquarters are finally ready for use the examinations of the young men and women who desire to become druggists will be conducted in a more thorough manner than is possible at present, and the community will be a gainer. All this is worth waiting for.

Eighteen druggists in Malden have petitioned for liquor licenses.

An examination of would-be druggists is to be held in Boston early in May.

C. C. Bingham, the St. Johnsbury, Vt., druggist, is improving his store considerably.

A thief who stole some goods from one of Cutler Bros.' delivery wagons was fined \$25.

Edgar I. Kendall, assignee, has lately sold the stock and fixtures of a drug store in Milford, N. H.

Hon. Gorham D. Gilman is still giving to appreciative audiences his admirable lecture on Hawaii.

Of five applications for liquor licenses in the town of Medway, where prohibition is no longer in force, three are from druggists.

There was a little blaze lately in Knight's drug store, corner of Court and Hanover streets, but the damage was only trifling.

It is reported that Arthur A. Chesley, the Rosindale druggist who eloped with Mrs. Munz, returned to Boston on April 13, from Halifax, but quickly disappeared from sight.

The Massachusetts House of Representatives has refused to reject the bill providing for the granting of druggists' licenses only to pharmacists who are of good character and possess fitness to receive them.

Alfred A. Reed, who had been carrying on an extensive business in vaccine virus, in Brookline, under the name of Henry A. Martin & Sons, committed suicide early this month.

D. W. Sullivan & Co., druggists, Concord, N. H., have dissolved partnership. Eugene Sullivan will conduct the business at the old stand, and D. W. Sullivan will open a new store at the corner of Pleasant and Main streets.

Although the citizens of Maynard voted in favor of license, the autocratic board of selectmen announces that none will be given, not even to druggists. This practice is becoming altogether too common. Of what value are elections if a handful of men can nullify the citizens' act?

Cigarettes and cigarette tobacco may still be sold without let or hindrance, except as already provided for by law, as those opposed to their use failed to convince the public health committee that the little rice paper rolls were as injurious as represented, and "ought not to pass" was the verdict read by the clerk.

More money is greatly needed by the State Board of Pharmacy for the prosecution of the work for which the commission was created. It is impossible to give proper attention to all the cases which ought to be taken into the courts, with the small appropriation which the board now has at command.

The legislative committee on public health has reported "ought not to pass" on a bill requiring owners of patent or proprietary medicines to furnish the State Board of Health with the formulae used in the preparation of the same, the health authorities to analyze the medicines and report whether they contain anything of a poisonous nature.

Sessions of the Pharmacy Board were held recently, at which forty-three applicants were examined. The following-named were granted certificates: William B. Milliken, of Cambridge; William Hardin, of Boston; Patrick A. Dolan, of Natick; Ernest H. Bailey, of Northfield, Vt.; Richard F. Smith, of Lawrence; George H. Powers, of Holyoke.

James I. Knowlton, Salem; Hairabed S. Djelalian, Cambridge; John S. Alley, Marlboro; Wm. D. Sproat, Pittsfield; S. W. Munnis, Boston; J. E. O'Connor, Haverhill; Herbert A. Wiswell, Worcester; Burton N. Holmes, Waverley.

Kelley & Durkee, for many years established as druggists at the corner of Boylston and Berkeley streets, and who were the first pharmacists to go on to the Back Bay, finding their present quarters too limited for their increasing business, have just taken a long lease of the building

No. 392 Boylston street, and will soon have at that central location one of the largest and most attractive drug stores in New England.

Dr. J. Williams, a well-known magnetic healer and massage operator, went into Charles E. Griswold's drug store in Hartford one morning recently and passed through to the basement. A short time after he was found by a clerk lying on his back with a deep gash in his throat, self-inflicted with a sharp penknife. The wound was sewed up by a doctor and the would-be suicide removed to his home.

Druggist A. C. Smith, of Natick, recently appeared before Judge Mullikan to answer to a complaint for illegally selling liquor. The only witness who testified was Charles J. Wilson, employed as hostler by W. D. Parlin. He testified that Smith sold him perhaps three bottles of beer. The judge ordered Smith to pay a fine of \$50. Smith appealed, and the case will come before the Superior Court on June 1.

Bagley's Pharmacy in St. Johnsbury, Vt., exhibits a show window of much originality. A green grass mat forms the ground work, and in this up to the knees, is a healthy-looking cow, which can utter sounds, and is asserted to be free from tuberculosis. In the middle is a heap of scrap-iron, and at the other end a jug marked "wine." In the background is a big bottle of "Bagley's Beef, Iron and Wine," to serve as the answer to the rebus there displayed.

Somehow or other, any legislative committee before whom Charlotte Smith appears in advocacy of her peculiar reforms, does not appear to be profoundly impressed with her peculiar style of eloquence, and invariably reports against her proposed reforms. The last matter on which she has been wasting her eloquence is face powders, but as no one but herself appeared to complain of any serious loss of beauty through the use of powders, the committee reported "ought not to pass" on the act sought to regulate their sale.

It seems probable that the Legislature will adopt the bill which provides that liquor licenses shall be granted only to registered pharmacists having certificates from the Board of Pharmacy that they are proper persons to receive such licenses; the bill being amended so that any registered pharmacist may be considered a proper person to receive such certificate, when no complaints have been made against the applicant for such certificate, and when complaints are made, they shall be in writing, specifying the reason, if any, why a certificate should be withheld.

If the recommendations of the legislative committee on public health are adopted, all vaccine institutions in the state will hereafter be under the supervision of the State Board of Health. The committee appeared to have become convinced that there should be somebody held responsible for the proper inoculation of cows. To be sure there are a few places in the state where the work could not be done more carefully and conscientiously than it is at present; but these places will lose nothing; and it appears to be wise to have the rest of them inspected by some officer.

The annual meeting of the Alumni Association of the Massachusetts College of Pharmacy was held in the college building, corner of Garrison and St. Botolph

streets, on the evening of April 12, President J. Allen Talby, class of '78, occupying the chair. The address by Rev. Edward Benner, of Wellesley, on "The Yellowstone Park," announced for the occasion, was postponed on account of the inclement weather. These officers were elected: President, W. F. Craig, of Lynn; vice-presidents, Frank H. Carver, F. L. Decker; secretary, Prof. W. L. Scoville; treasurer, J. A. Talby; auditor, J. G. Godding. At the conclusion of the business session there was presented to the retiring president a handsome mantle clock.

James Folsom, a resident of Woburn, died on April 12. He was born in Eastport, Me., in 1819, but since early manhood had been engaged in the wholesale and retail drug business in Boston, till he lately retired from active business life. Mr. Folsom was the pioneer druggist south of Dover street to Roxbury, keeping a store at the corner of Canton street and Shawmut avenue, in his time called Suffolk street. He afterward moved to the corner of Concord street, and later engaged in the seamen's medicine chest business on Eastern avenue, at the North End. Mr. Folsom was a quiet, unostentatious man with a life full of deeds of kindness and a participant in many friendships. He was a devoted member of the Episcopalian Church, and warden at Trinity Church, Woburn. His wife survives him.

There was held in Boston a short time ago a meeting of the Apothecaries' Guild of Boston and vicinity which proved to be of the greatest interest. President Stiles made a long address which the guild very properly voted to have printed for general distribution. The organization was urged to contribute willingly and liberally to the treasury in order to carry out the well-laid plans. Mr. Henry Canning, who followed President Stiles, spoke encouragingly. Incidentally he said: "The movement is a national one, and must continue as such if success is ever to be achieved. Patience and perseverance are required, in conjunction with unanimity, to lead to the goal on which the eyes of the trade have long been set." Mr. G. W. Cobb, one of the most active members, spoke earnestly in opposition to cutting prices, asserting that all the members need to do to abolish the practice is to stand together and work diligently and untiringly. It was an interesting and helpful session throughout.

Nobody can say that trade in soda fountains is dull when the Low Co. reports the following sales to druggists: H. J. Bass, 165 Cambridge st., Boston; Samuel Siskind, 1277 Tremont st., Boston; J. R. Colby, Malden; Aaron Pratt, Brookline; J. J. McManus, Lowell; H. F. Messer, Haverhill; J. E. Bryant, Wellesley; H. L. Green, Wenham; C. F. Ripley & Co., Taunton; W. W. Clough, Medway; L. R. Davis, Northampton; J. E. Royce, Brockton; T. J. Glennon and M. F. Stokes, Lawrence; J. G. Norton, Cottage City; M. C. Farr, Augusta, Me.; L. A. Page, Camden, Me.; F. E. Lowell, Newport, N. H.; H. J. Alford, Providence, R. I.; Starr Bros., New London, Conn.; A. Yost and L. G. Landon, Meriden, Conn.; Samuel Chesboro, Willimantic, Conn.; Fassett & Messaros, New York City; Flood & Kingsley, Sandy Hill, N. Y.; G. H. Corwin & Co., Greenport, N. Y.; and also at Shelter Island Heights, N. Y.; Burton & Smith, Schenectady, N. Y.;

P. F. Guthrie, Franklin, N. J.; J. Taylor Clark, Bayonne, N. J.; A. D. Mallenon, Plainfield, N. J.; G. W. Heard, Clear Springs, Md.

How highly the late William J. Cutler was esteemed by Boston druggists was evidenced by the action of the trade when his death occurred. There was a large attendance at his funeral, and the pall-bearers were all men of prominence. Among the gentlemen present at the services were Thomas Dolliver, Joseph Burnett, Nathaniel J. Rust, and Theodore Metcalf, representing the Boston Druggists' Association; John Carr, president of the First National Bank; Judge Mason. Hon. Gorham D. Gilman, Rev. Samuel N. Warren, A. G. Weeks, of the Weeks & Potter Company; John Carter, of John Carter & Co.; Professor James N. Dunbar, of Harvard University, as well as the employes of Cutler Bros. & Co. Among the members of the family present were Edward Cutler, of St. Paul, Minn.; Abram Cutler and Charles Cutler. The coffin was covered with flowers and the chancel was filled with palms and many handsome floral pieces, among them being arches from the First National Bank and the employes of the firm of which Mr. Cutler was a member.

At a meeting of the wholesale druggists of Boston the following resolutions on the death of Mr. Cutler were adopted:

"We are reminded, by the very sudden and unexpected removal of our friend and associate, William J. Cutler, from this life to that of the immortal life beyond, of the great uncertainties that surround us."

"That as the active business representatives of an honored house for many years he was widely known and esteemed."

"He was a living illustration of devotion to the high principles which were the foundation of his faith and character and which dominated his life and conduct."

Therefore Resolved, "That we, wholesale druggists of Boston, unite in expressing our appreciation of the high character of the late William J. Cutler, and our sense of loss in his being taken from us."

"That in the great mysteries of life, we most sympathizingly commend his family to the great All-Wise, who doeth all things well, and in whose keeping our beloved ones are always safe, though for the while separated from us."

"That these resolutions be transmitted by the officers of this meeting to the members of his family."

Resolved, "That as a token of respect to the memory of our late associate, William J. Cutler, we close our places of business during the hour of the funeral."

Vancouver, B. C.—Trade is quieter among the druggists than at any previous time in the history of British Columbia. Summer is here and the perfect dry weather keeps drug dispensers from desponding too much.—J. Harding Kamloop has assigned for the benefit of his creditors. He has been allowed an extension of eighteen months.—John Reed, one of the most prominent druggists of Vancouver, B. C., has been obliged to sell out, J. F. Jaek, of Victoria, B. C., being the purchaser. The business is being continued in Mr. Jaek's name. Mr. Reed has taken a partnership in the drug house of Messrs. J. Sinclair & Co.—Messrs. McDowell & Co. have sold the stock and good will of their branch store in Vancouver to J. K. Sutherland, formerly an employe of the firm.—Embryo druggists are not very numerous in British Columbia. At the semi-annual pharmaceutical examinations of the province just concluded one candidate presented himself. He was plucked.

PHILADELPHIA.

Philadelphia, April 18.—For some time there has been considerable trouble among the glass lamp workers of Whittall, Tatum & Co., but an agreement was entered into between the firm and the national officers of the Flint Union a few days ago which was perfectly satisfactory to all concerned. Every one of the old hands was taken back and the prospect for steady work for the balance of the blast is excellent.

At a meeting of the board of directors of the Philadelphia Drug Exchange, held on April 11, the following resolution in reference to the death of Edmund A. Crenshaw, prepared by one of the members, was adopted:

"The death of Edmund A. Crenshaw adds an honored name to the list of our departed associates—a list that has so lengthened within the past few years, as to have become too suggestive and impressive. When the admonition to 'say nothing but good of the dead' may sometimes lead to fulsome flattery, and adulation undeserved by any, surely the friendly critic may be pardoned, if he should veil all imperfections, and point alone to that which, in its goodness, and purity, may improve, encourage and instruct."

"It is most gratifying to have the privilege, which is mine by your courtesy, to express the very high regard in which Mr. Crenshaw was held by me for many years, and to feel that my estimate of his character is not exaggerated. Mr. Crenshaw died February 27, 1894, at the age of 67. If criticised as a type of manhood he was of distinguished presence. If judged as to deportment, his manners were most engaging, being at once dignified, amiable and affable. If examined as a man of business, he was governed by principles of rectitude and honor. In his family relations he was a most careful and responsible of husband and father, he was kindly, considerate and indulgent."

"In attention to religious affairs, he was faithful and constant, and assisted by his daily noon devotions of his professions. That the love of such a man will be felt, and for many years, by the community in which he dwelt, by his partners in business, by his associates in church work, by all those, in fact, with whom he came in contact, and especially his immediate family, need hardly be asserted, for from the standpoint of such a character much may be viewed, there is much to respect, much to admire, much to love."

"So that, while the life of no man can be recognized as 'perfect' and 'complete' while we may no further seek his merits to disclose, it can be said, briefly, but in all sincerity, that the name of Edmund A. Crenshaw, for years to come, will sum up, for most delightful memories."

Messrs. John M. Maris & Co. report that their business since January 1 has been very good, and that their sales show a very good increase over the corresponding period last year. Their glass engraving department is working to its utmost capacity on orders, and they are again compelled to increase it, and are at present making the necessary alterations. This firm has added a number of new desirable styles to their already large line of goods for the soda fountain, and carry a very full and complete stock of these goods. They have several new specialties that they are about to place on the market, and which the trade may soon expect to see advertised.

The Apothecaries' Union has at last opened its new headquarters, 610 Arch street. It has the whole first floor and basement, and as the building has a good depth there is a splendid opportunity to display the goods. The store has the appearance of a large wholesale drug house. It is the intention of Mr. Frank R. Rohman, the general manager of the union, to have displayed in various positions the different signs of the various drug houses

with which they deal. At the present time there is only one such sign displayed.

The Distillers' and Cattle Feeders' Trust is not as bold and as domineering as it has been. Whether this is because the courts have made an impression or that the general dealer has begun to think for himself and purchase his goods wherever he pleased without first having gained the consent of this august body, it is hard to tell. It appears now that the trust is willing to sell its products to all those who are desirous of having them and no questions are to be asked. The goods are to be sold with or without the rebate voucher, which has been the stumbling block for some time. It is also stated that rebate vouchers are being cashed as they mature and without protest, when the presenters are known to have secured a portion of their recent supplies from independent distillers.

George P. Connor is making preparations for an extensive soda water business this summer and he believes that this season will be the best yet this trade has seen for some time. He bases his belief on a good trade owing to there being no fair this year, and as money is somewhat scarce people will stay at home and alleviate their thirst during the summer months with the cold sparkling drink, which invigorates. Mr. Connor is of the belief that a drug store can be used for more than to sell drugs alone and with this idea in view he frequently offers for sale such novelties as he thinks will attract the public. Recently he did a large business in disposing of a number of Turkish sabers, and now he is engaged in supplying every household with a mascot in the shape of a horseshoe, which is a fac-simile of those worn by some one of the famous trotters. He says he intends to sell anything in his store that he thinks can be disposed of, as he believes it is a good plan to get out of the old conventional way of only dispensing drugs.

Charles E. Hires left this week for Chicago to oversee the starting of his new office and the getting out of the necessary formulas for the spring and summer trade. His company in this city is very busy getting out the root beer for the spring trade and the prospects are better than ever before. Owing to the demand for root beer he is contemplating the working of a day and night force. Ever since the manufacture of root beer by this firm they have had more or less trouble in getting their goods properly carbonated into bottles, and the firm is now negotiating for a plant of its own. Mr. Hires, besides being connected with this firm, is a bank director and a director of the Philadelphia Drug Exchange, which is taking a prominent part in this city in securing a memorial building in honor of the late George W. Childs. On April 11 Mr. Hires delivered an address before the Friends' Social Lyceum at the Friends' Meeting House, Seventeenth street and Girard avenue, his subject being "George W. Childs' Life Work an Inspiration to Struggling Young Men."

The J. P. Miller Drug Co., of this city, which has branch stores in Baltimore, Md.; Chester, Pa.; Easton, Pa.; Harrisburg, Pa.; Reading, Pa.; Trenton, N. J., and Wilmington, Del., all of which are classed by the N. W. D. A. as rate-cutting establishments, it is stated is to become more aggressive and enter into the field occupied by the wholesalers.

This pleases the wholesale dealers, as they are now in a position to notify the proprietors of proprietary goods that the house does not maintain prices and that they, according to their agreement, must refuse to sell it.

The elaborate exercises incident to the commencement of the seventy-third graduating class of the Philadelphia College of Pharmacy were held last week, and were of an unusually interesting character. Three days, April 11, 12 and 13, were filled with events in which both graduates and professors took prominent parts. The graduating class numbered 183 members—the largest which has ever been at the institution. The thirtieth annual reception of the alumni association began the festivities, for those who passed through the ordeal of examination, which lasted from March 30 to the evening of March 27, certainly did feel festive. The affair was a brilliant one socially and full of instruction and entertainment, to say nothing of oratory. It was held on the evening of April 11, in Association Hall. This is the time when the graduates' lady friends are very numerous, almost more so than on commencement night, and this year's gathering was no exception in that respect. David H. Ross, class of '73, presided, and welcomed the guests in a pleasant manner. He, with Edward C. Jones, William E. Krewson and Dr. J. L. D. Morrison, formed the committee on reception. The Zeta Phi Glee Club's songs were a feature of the programme, and many hearty encores were in order. Howard P. Ziegler, of Reading, Pa., delivered the class oration in excellent style. George Louis Kuppel, of Zanesville, O., told facts about the class' history, which were new to many and surprising to others. Walter Joseph Garver, of Hagerstown, Md., prophesied and foretold many wonderful things he anticipates will happen to his classmates. There was also a class poem, for which David Walter Thomas, of Spartanburg, S. C., was responsible.

George W. Lufte, of Salt Lake City, was the lucky young man who was presented with the alumni gold medal for having made the highest general average in his studies, and David L. Greenwalt, of Chambersburg, Pa., got a certificate for the best average in the junior class. Certificates for the best examinations were awarded as follows: Pharmacy, John Culley, Ogden, Utah; chemistry, Charles E. Hamilton, New Lisbon, O.; materia medica, Charles C. Manger, Booneville, Mo.; general pharmacy, Charles Jeffries Black, Chambersburg, Pa.; operative pharmacy, Louis Reese, Hazelton, Pa.; analytical chemistry, Edward Hodgson, Norfolk, Va., and specimens, Frank H. Atkins, Lebanon, Pa. August G. Wagner, of Germany, was awarded a special prize for the best collection of botanical specimens. Certificates were presented to the members of the microscopy class by George M. Berlinger, their instructor. Secretary William E. Krewson called the roll of new members—183 in number—to whom the alumni certificate was presented.

The business meeting of the alumni association was held at the college in the afternoon, David W. Ross, president. He read his annual address, which was pregnant with suggestions for ways and means to advance the institution's interests. Reports of committees were considered, showing that much effective work

had been done during the current year. It was reported that nineteen members had died since the date of the last annual meeting.

The election of officers resulted in these gentlemen being chosen: President, William L. Cliffe, '84; first vice-president, Jacob S. Beeton, '78; second vice-president, Dr. J. L. D. Morrison, '88; treasurer, Edward C. Jones, '64; secretary, William E. Krewson, '69; corresponding secretary, Joseph Crawford, '81; trustee of sinking fund, Thomas S. Weigand, '44.

The class of '81 held a reunion at the Hotel Metropole on the evening of April 10, which was a happy occasion. It included Profs. Moeric, Ryan and Lowe, besides others who are brainy and active in college life. About thirty were present at the banquet, the faculty being among the guests.

The complimentary banquet tendered the senior class and officers of the college by the professors was a time for good cheer, good speeches and mutual congratulations that tempests and trials—which had been much magnified by the students—were buried in history. Long tables were arranged in the college museum on Thursday evening, April 11, and a royal time was enjoyed. Of course all the professors made speeches, as did the prominent classmen. President Aughenbaugh, of the Zeta Phi Society, had an assignment from his associates which was performed in a graceful manner. He presented a fine crayon portrait of the late Prof. John M. Maisch to the college. The act was much appreciated by the faculty. There was another incident of importance not on the programme. The boys quietly made up a subscription of \$70 as a donation to the alumni association towards paying for the new electric plant about to be placed in the college building. It was late when the banquetters broke up, and everyone felt that the professors had extended genuine hospitality towards them. One hundred and seventy covers were laid.

Fair weather smiled on the graduating class on commencement night, April 12, and the big Academy of Music was filled with friends of the ambitious young men, from pit to dome, including three galleries. At 7:30 o'clock Bastert's Orchestra rendered some beautiful selections before the entrance of the graduates on the stage. Then the senior class entered—183 strong, wonderfully arrayed in cap and gown. The boys remained standing until everyone was in his place, when the college cheer was given with lung-power that was unimpeachable.

Prof. Joseph P. Remington, as dean of the college, called the roll, and, as each student walked forward, he saluted. When a triangle was formed with about forty-five men, President Charles Bullock conferred the degree of graduate in pharmacy and presented the diplomas. Four sets were needed before the class was graduated.

Prof. Sadtler gave a certificate of proficiency in chemistry to Edward D. Helme and David T. Werner, and President Bullock conferred the degree of master in pharmacy (Ph. M.) on Robert Shoemaker, of the firm of Robert Shoemaker & Co., this city; Professor Albert E. Ebert, Chicago; Dr. Charles Rice, New York, and Dr. Edward R. Squibb, Brooklyn. The award of the prizes was then in order. These were the fortunate ones: Maisch memorial prize, a Zentmayer

microscope, given in his lifetime by the late Professor Maisch as the materia medica prize, and now being presented by his family, was received by William H. Whitcomb, of Michigan. Hon. George W. Kennedy made the presentation speech. The pharmacy prize of a gold medal, offered by Dean Remington, was captured by William C. Aughenbaugh, of Maryland, the donor presenting it in person. The chemistry prize of an analytical balance, given by Professor Sadtler, was presented by him to Charles C. Manger, of Missouri. Professor Henry Trimble's analytical chemistry prize of \$25 in gold was presented by him to John Culley, of Utah. The John M. Maisch prize of \$20 in gold, offered by Mr. J. H. Redsecker, of Lebanon, Pa., was given to George F. Banch, of Ohio. Louis Reese, of Pennsylvania, was presented with the operative pharmacy prize, \$25 in gold, donated by Mr. Charles L. Boggs, Charleston, S. C., Mr. James T. Shinn speaking for Mr. Boggs. John Culley got another souvenir in the way of the handsome prescription balance which was the H. J. Maris theoretical pharmacy prize. Dr. A. W. Miller presented it. The J. S. Robinson prize for the best examination in theoretical and analytical chemistry was presented to Charles C. Manger, by W. Nelson Stern, for the donor.

After the orchestra took advantage of another opportunity, the valedictory address was delivered by Professor Samuel P. Sadtler, Ph. D., who was listened to with close attention. What he said was filled with forceful ideas.

When the formal exercises were concluded, hundreds of ladies and gentlemen met the graduates in the foyer to extend congratulations. Flowers, canes, books and valuables of all sorts were received by scores of the boys, and many left the academy loaded down with gifts.

DETROIT.

Enquiry among the retail druggists of Detroit has brought out a diversity of opinion relative to the ultimate success of the general cut-rate policy which went into effect some time ago. At present a large number of druggists are advertising to sell patent medicines at cost, and while admitting that a slight increase in sales is being made, they cannot see exactly where the profits are coming from. They are beginning to consider the advisability of adopting some other method in bringing the regular "cut rate" stores to assignments.

The meeting of retail and wholesale druggists which was reported as having been held in room 422 of the Hammond building for the purpose of perfecting a scheme to regulate the sale of proprietary articles and keeping them out of the hands of the cut-rate people, may possibly have occurred in that locality, but enquiry made among the prominent retail druggists and wholesale houses has failed to elicit any reliable information as to what was done that evening or who were the parties present. It is now positively stated by many that in their opinion the whole thing was a "fake" sprung by an ingenious cut-rate proprietor upon some active reporter and subsequently used as advertising capital. In view of the fact that no authentic information can be obtained from a reliable source to show that any concerted action was undertaken on the part of the druggists,

there is reason to believe that the general opinion is about right.

Detroit College of Medicine, department of pharmacy, in conjunction with the department of medicine, held its commencement exercises in the Auditorium April 19. The degree of Ph. G. was conferred upon the following members of the graduating class in pharmacy: E. R. Borley, Miss Ida E. Courville, A. E. Johnson, E. S. McColl, N. G. McBean, R. H. Reynolds, H. Shannon and H. B. Ward. Prof. F. H. Frazer delivered the address on behalf of the pharmacy department. Mr. Shannon, having received the highest standing in all of the courses, was presented with a gold medal. After the exercises in the Auditorium the members of the graduating class and the faculty repaired to the Hotel Cadillac where a banquet was served.

B. M. Patterson, of Grunow & Patterson, left on the 24th for New York, accompanied by his mother and sister. On the 26th the party sailed for Scotland, where, and in England, a two months' visit will be passed. B. M. will, of course, run over to Paris. Before his departure some thirty or more of his friends, bachelors and benedicts, met at the house of Lawyer James Swan for a "smoker," and after cards, refreshments and tobacco in all forms, were favored with a speech from brother Patterson in acknowledgment of a parting gift of a pair of finest field glasses. His friends took this prediction that the young man may see all there is to see while he is away.

W. J. Moore, of Sagnaw, has put in a new soda fountain. It is built of onyx and is of the latest pattern.

Perry Weed, until lately manager for W. D. Harshaw & Co., of Pontiac, will open a new store for himself at that place.

Dr. Plessner, of Bay City, formerly connected with the laboratory of Farrand, Williams & Clark, is returning from a winter's visit in Italy.

Arthur Loranger, of Loranger & Fournier, has spent the winter in Algiers, Africa. He is expected to return some time during the early spring.

Dr. G. J. White, of Jackson, now located in the Hibbard House block, expects to get into his new store near the depot about April 15. Z. W. Waldrun & Co. will occupy the Hibbard House corner May 1.

E. J. Kennedy, for three years past professor of practical and theoretical pharmacy in the department of pharmacy, Detroit College of Medicine, has resigned. Mr. Kennedy will move to New York city.

Arthur Mummery, formerly in the employ of Frank Ingils, of Detroit, will open a new drug store at Ann Arbor on May 1st. Mr. Mummery has selected a desirable location and is securing the necessary stock and fixtures.

Fred C. Loranger, managing proprietor of the Loranger pharmacy, has spent several days in the upper part of the state. He has decided to turn the rear end of the pharmacy into ice cream parlors, and during the past week has had the necessary alterations made.

Dr. P. V. Felt, of Belleville, lately purchased the drug store formerly owned by Felt & Cobb, at that place. As a mistake was made in reporting the transfer in a former communication considerable annoyance has been caused the doctor. A. L. Smith, who sold out to the late firm, is now a student in the Detroit College of Medicine and is not connected with the business.

BUFFALO.

Buffalo, N. Y., April 22.—There is no change for the better in business. Druggists, like other people, are waiting for the tide, and they will not flourish till it comes. Buffalo druggists are holding on well and will do so till there is improvement, then they will flourish again. Like every other business, drug specialties do not net much of a profit now. The hot soda dispensers say that if it were not for the theater patronage it would hardly pay expenses, but with the little crowd that comes in at 11 p. m. and the other things that the hot soda people buy, there is moderate profit, that is, so long as only a few druggists are running fountains.

When this locality falls in a whole season to capture any opium smugglers there is reason to believe that the crooks are smarter than the detectives. It has turned out so in this instance, though the authorities are once more ahead. On the night of April 7th Inspector Dirnberger, of the custom house staff, with the aid of several assistants, located about 300 pounds of opium in a Chinese store on North Division street. The detectives had seen most of it brought from Black Rock by three men, who were captured on the spot. They gave their names as Charles Kennedy, Edward Patterson and George Henderson. Two are known as all-round crooks and the other is said to have been at one time a barber and hotelkeeper or anything else convenient, at Windsor, Ont., where he learned the smuggling business. The names are fictitious. There were several Chinamen picked up next day after the raid, though they all fled at the time and escaped. At one time there were nine of them along with the three principals in the jail, but some have been released. An interesting part of the find was a package of 182 opium stamps which had been soaked off other cans for use a second time. Nearly all of them bore date of October 25, 1893, when these same people bought a lot of opium at auction which had been seized. The gang hadn't had time to paste them on the new consignment. The stamps at \$6 each would be worth \$1,092. Opium is worth \$7 a pound in Canada, yet with the \$12 duty added the last lot sold at auction brought only about \$12.50, so there is money in it for a smuggler fence to buy back his own captured goods. The Chinese store implicated is known as the Quong Wing Chong Co., and is said to have branches all over the country, even in British Columbia, where most of the opium is landed from China.

It is thought that the last set-to between Health Physician Wende and Chemist Vandenberg has taken place and the city is tranquil again. They joined issue before acting Mayor Richmond on April 5th and fought out the question of the relative disinfecting power of chlorine and bromine. Dr. Wende had already bought a quantity of the latter with which to disinfect the big reservoir and, of course, he stood by it. Dr. Vandenberg putting up a strong case for liquid chlorine. He presented letters from experts strongly advocating chlorine in preference to bromine, and even offered to buy the bromine of the city if the cheaper chlorine was used. The Mayor stood by the health physician, however, and next day the bromine was sprayed into the reservoir. The water has since been let in, and the

city water supply is again supposed to be free from typhoid germs. The scare has been of great value in one regard at least. It has shown the medical "experts" how little they really knew of bacteria and disinfectants. After the july debate between Drs. Wende and Vandenberg took place one of the local papers wrote the battle up as a sparring match, with Dr. Wende as the Bromine Boy and Dr. Vandenberg as the Chlorine Cyclone.

Low's Art Tile Soda Fountain Company is moving out of its narrow quarters on Pearl street and locating in the commodious Jewett building at Perry and Mississippi streets, where heat and power are furnished in the lease. This will make a large saving and the establishment feels that it no longer needs to be located at the business center, for the need of a show room is now over. When people come to the city to look at the work all that is necessary is to take them to some drug store and show them a fountain in operation. Considering the fact that druggists are poor this year, fountains are selling well. The company has five salesmen on the road. It has dropped special manufactures for the present and is making only regular fountains. The change in the style of placing orders is noted as very embarrassing to the trade. In flush times the rule was to order a fountain as early as February if one was to be bought for the coming season. Now a druggist begins by thinking about it. Then he waits till March, then till April, then he puts in his order and wants the fountain next week.

John T. Sanford, who came from Ithaca to attend the Pharmacy College and remained here in various druggists' employ since graduating, has engaged at Liebert's pharmacy on Genesee street.

At the burning of the Hamlin grape sugar and starch works on April 12th a great amount of chemicals was destroyed. In one room there were thirty tanks of sulphuric acid, said to contain thirty tons each. Explosions were looked for, but none occurred. The entire loss from the fire was close to \$1,000,000.

The Hudor Lithia Company, one of the mineral water establishments which profited by the late typhoid fever scare, has elected the following officers: President, Samuel C. Rogers; vice-president, George M. Bailey; secretary and treasurer, A. B. Wright.

Dr. P. Harold Hayes, who has made his name known all over the country as a specialist in asthmatic diseases, died on April 9th, aged 70. He was a graduate of the Jefferson Medical College, Philadelphia, in 1848, and spent several years in New York Hospitals. From 1875 to 1885 he practiced medicine in Binghamton. He then moved to Tonawanda, where he remained till two or three years ago, when he came to Buffalo.

At the first April meeting of the County Board of Pharmacy nine applicants were examined for licenses. There were no licenses granted without examination. The certificates of three licensees from the March examination were signed and delivered as follows: Stephen M. Spryszynski, who will locate a store in the Polish district at Peckham and Townsend streets; Edgar J. Foote and Juman H. Howes, whose places of business were not known to the board. Mr. Howes gets an assistant's license, the others a full pharmacist's.

CINCINNATI.

Cincinnati, O., April 22.—The leading theme among druggists and physicians here is the erection of the large office building, which was briefly referred to in the last number of the Era. The objects of the building are many and it will be a decided innovation. The success of the undertaking now seems to be assured and quite a number of well-known pharmacists are laying their lines to secure the first floor of the building. The representatives of two surgical instrument houses are also endeavoring to secure quarters in the structure. The encroachment upon the resident portions by the increasing business interests has crowded the doctors from one place to another until this plan has been hit upon as affording a chance for a permanent location. The proposed structure will be provided with every convenience for the accommodation of its tenants. In addition to the druggists on the first floor, will be a first-class optician, surgical instrument maker, and kindred business men. The advantages claimed for this sort of a building are that it will be known exactly where the physicians may be found. They will be all equally easy of access, and the apartments where the patients are to be brought for special treatment will be especially equipped for the purpose. As far as the success of the plan is concerned the occupancy of the building by the doctors would be practically permanent and the income almost sure. A number of the foremost local physicians are elated over the prospects for success of the venture. Among those who are deeply interested in the project is Dr. Thomas M. Stewart, who has given the matter careful study. It is said that Dr. John C. Otis, Wilmot Hall, Louis Helster, Dr. Weatherhead and other prominent pharmacists are not adverse to presiding over the proposed pharmacy which is to be established on the first floor of the building.

Dr. James Y. Cotter, the veteran druggist, is dying at his home from laryngitis. Two weeks ago the doctor was brushing his teeth, when one of the small bristles of the brush came out and slipped down his throat. He attempted to get it out, but was unable to dislodge it. He soon noticed a slight inflammation in his throat that was intensified each day, until it had now developed into laryngitis. He has been in bed now for more than a week, and his death is expected at any moment. The trouble takes a peculiar turn at times. He is so weak as to be unable to cope with one phase of the disease, and during these periods an inability to properly inflate the lungs causes him to lose his breath. It is feared that he will die in one of these spasms. Dr. Cotter says he is sure that the bristle is out of his throat. The attending physicians have made a search for it and have been unable to locate it. While they will not give it out at this time as a decided opinion, there is a suspicion that the bristle has gone into one lung. The accident is without precedent in this city and has caused no end of talk among the druggists and physicians.

Druggist George Smaltzer, who lives in Covington, is telling all about a ghost that he saw near the corner of Scott and Pike streets. There is a large brewery in this vicinity. Away back before the war one of the attaches of the brewery

used to spend a large portion of the evening in playing sixty-six with friends. The game some nights would last until rather late. Several years ago this man joined the silent majority and now comes the statement that his figure is seen every night at 12 o'clock playing the time-honored game of cards. Smaltzer and several of his friends, who are possessed of strictly temperate habits, claim that the story is true in every particular.

The twenty-second annual commencement of the Cincinnati College of Pharmacy was held at the Scottish Rite Cathedral on Wednesday evening, April 18. The pretty and spacious building was a blaze of glory. The colored lights, interspersed with Chinese lanterns leading from the street to the main entrance, formed a triumph in decorative art. The main auditorium was prettily embellished with flowers, potted plants, flags and bunting, and was thronged with a select audience. A corps of competent ushers handed the crowd and everyone was looked after. Extra chairs were placed in the aisles and Weber's superb orchestra was stationed at one side of the large stage. Seated upon the stage were President J. U. Lloyd, Secretary A. W. Bain, Corresponding secretary W. Simonson, Treasurer C. T. P. Fennel, Trustees Geo. Eger, H. H. Hoberg, Julius Gregor, T. L. A. Greve, A. Meininger, Louis Klayser, John Ruppert, Otto E. Betz, Albert Wetterstroem; Profs. Julius H. Eichburg, Adolph Leue, Otis L. Cameron and others.

The exercises were very interesting and lasted from 8:30 p. m. until 10 o'clock. Diplomas were awarded to the following students: Robert C. Tarbell, Edward F. Manning, Charles F. Strelch, William L. Ritter, Arthur L. Marchlein, Mrs. L. S. Schreck, Otto E. Kistner, Allen M. Moon, John L. Greenwood, Louis L. Augert, John G. Oesper, H. Fred Curtis, Miss Martha L. Beers, Louis A. Ribar, Paul Elchert, Dorsey C. Ross, John J. Jobes and Fred Roettig. At the conclusion of the commencement exercises the banquet hall in the rear of the main auditorium was repaired to. Here is where the festivities reached the 33d degree of gaiety. Every one seemed intent on having a good time, and many good-natured jokes were cracked. After the sumptuous feast had been enjoyed those present repaired to the ball room, where the light fantastic was enjoyed till the wee small hours. Much of the credit for the success of the festivities is due to a committee of the following gentlemen: C. T. P. Fennel, A. W. Bain, Louis Klayser, Theo. Wetterstroem, Charles J. Kaefer, Rud. Falk, George Eger, Jr., Charles Wagner and William Simonson.

Ball Room Tips.

Andy Bain is a waltzer from Waltzerville.

Prof. C. T. P. Fennel is the prize polka dancer.

Louis Klayser and George Kyllus enjoy quadrilles.

Louis Sauer went through the menu from soup to nuts.

George Eger and his son, the doctor, danced in the same set.

John Ruppert was the gayest of the contingent from Price Hill.

Herman Hoberg enjoyed the dance and didn't miss even one number.

Wilmot J. Hall told the boys all about the merits of Forbes' Diastase.

Dr. John C. Otis and Dr. Chas. Woehner shook hands and talked politics.

Albert Meininger told 'em all about his elegant new store in Cumminville.

Louis Kuswick and Will. Wagner looked on but refused to join in the dance.

Billy Hiale told Cy Calvert a few things about the Main street drug exchange.

Peter Nodler, of Covington, was not there, but some of his neighbors were.

Julius Greyer, the prize bowler, was in his element and danced with much zest.

Julius Eichberg wore a white chrysanthemum and mingled among the ladies.

Ed. Dehner was telling the boys all about his great discovery for headache.

Albert Wetterstroem knew all the pretty girls from his ballwick in the twenty-fifth ward.

Otto Betz showed the east end people through the building and smiled as he went.

Dr. Otis L. Cameron took dancing lessons in his young days and he was right at home.

Otto Stein and Albert Vogeler were seen among the throng shaking hands with their friends.

The local druggists are nearly all sufferers from the gout. The pharmaceutical banquet explains all.

Druggist Joe Fuldner is out again.

The local slot machines are still doing a land office business.

Frank Dieringer, druggist at McMicken avenue and Brown street, is back from an extended trip to St. Augustine, Fla., much improved in health.

Wilmot J. Hall has returned from his southern trip much improved in health. He tells glowing accounts of his hospitable treatment by his southern brethren.

Fred Schanzle, the well-known young pharmacist who clerked for Druggist Julius Steffin for several years, will soon open an elegant drug store at Elmwood Place.

Herman Hoberg, the clever pharmacist at Wade and Cutter streets, who was joined in wedlock with an estimable young lady about a year ago, now lives in Clifton.

Charley Durr, until a short time ago a clerk for Arthur Helmenan, is now behind the prescription counter at Koehken's pharmacy, corner of Fourteenth and Mill streets.

Ben Hubbard, representing W. H. Schiefel-felin & Co., and Calvin A. Qulmbly, of the National Papeterie Company, were mingling among the druggists for several days during the past week.

Mrs. Dr. Withrow, wife of the president of the board of hospital trustees, passed peacefully away on April 7. The bereaved husband has the heartfelt sympathy of all of the pharmacists in the city.

F. X. Schmitter, the clever pharmacist at Findlay and Linn streets, has a new soda fountain in his store. He promises to surprise the populace with some of the new drinks that he will "spring" in the near future.

G. E. Lamb, who has managed Hall's drug store at Fourth and Elm streets for several years past, is convalescent after a severe seige of typhoid fever. He was confined to the City Hospital for almost three months.

The old Hermance drug store in Covington has been purchased from E. W. Kneeseby by Messrs. Kavanaugh and Davidson, who will make extensive improvements in the place. The store will have new fixtures and a new soda fountain.

Alfred Heilmann, the popular druggist, was one of the fortunate graduates at the Cincinnati Medical College. He captured the second prize for the best general examination. His average was 91 per cent.

A. Diebold, the druggist at Woodburn avenue and Madisonville Pike, Walnut Hills, has just purchased a \$5,000 soda fountain. Mr. Diebold has also put in an elegant lot of Bang's fixtures and now has one of the nicest pharmacies in the west.

Old stringency has certainly dealt kindly with J. F. Kutchbauch, the well-known Cumminsville druggist. That clever pharmacist has just completed a handsome new store room at Blue Rock and Lake-man streets, into which he will move in a few days.

Edward Peek, the well-known pharmacist of Covington, our sister city across the river, has just been appointed a member of the Board of Police Commissioners. Edward is a thorough business man and doubtless knows a thing or two about municipal affairs.

Edward Kipp, the affable young pharmacist of Camp Washington, mourns the death of his wife, nee Lucy Snyder, which sad event occurred on April 9th. Mr. Kipp had been married just one year and has the sympathy of a host of friends in his bereavement.

'Tis rumored that some of our leading pharmacists are interested in the new Rosedale Agricultural and Racing Association. Some of our "pill rollers" are getting to be real sporty boys, but it's a cinch their wives are not "on" or there might be some trouble.

John Keeshan, the veteran druggist, who, it is said, has passed the three score and ten mark, is becoming quite a horse fancier. "Uncle" John can be seen almost every pleasant Sunday afternoon taking a spin out the avenue behind a team of spirited trotters.

T. S. Jordan and John Rupert, of Price Hill, were the happiest druggists in the city last week. Their visages were continually wreathed in smiles and it was all on account of the new Price Hill electric cars. Theo. and John were strong advocates of rapid transit.

Ferdinand Ott has purchased the old-established drug store in Covington recently conducted by E. F. Cantler. The store is to be entirely remodeled and the new proprietor expects to have one of the nicest pharmacies across the river when the work of renovating and remodeling is completed.

Miss Pope, a clever saleslady representing Hudnut's New York pharmacy, was in the city several days last week taking orders for perfume. A female drummer is a novelty in these "diggins," but it must be said that Miss Pope made a decidedly favorable impression among the local pharmacists.

John Fallon, druggist at Fifth and Locke streets, is now the picture of a well-fed comedian. He has given his mustache the cold, cruel shake and he now claims that he has just realized that the hirsute appendage interferes with the expression of the face, in which the mouth is a prominent factor.

It is rumored that W. H. Adderly, the Mt. Auburn druggist, is soon to start a branch store on one of the hill tops. Brother Adderly is a thorough pharmacist and some of his proprietary remedies are sold in all parts of the country. He is also very successful in his own private

business and his new store will doubtless be a success.

There are two clever druggists doing business on opposite street corners in Cumminsville, and a short time ago one of them put out a sign with big letters bearing the inscription, "Deutsche Apotheke." The following day his wide-awake neighbor put out a large legend as follows, "American Pharmacy."

Hard work seems to agree with Druggist Arthur Heilmann. He allowed his clerk to leave his employ and now does all of the compounding and dispensing himself. He seems to thrive under the strain and the confinement seems to agree with him. They say he's going to get-oh, well, it's his nose of our business.

Harry Striethorst, the well-known drug clerk, had occasion to visit a rural cemetery the other day. He claims he saw the following inscription on one of the tombstones:

Here lies our Mary Ann at rest,
Pillowed now on Abram's breast;
It's rather nice for Mary Ann,
But somewhat rough on Abraham.

George Eger, Jr., was one of the brightest graduates at the Ohio Medical College when the examination is a criterion to go by. He captured the gold medal for the best drawing in anatomy, Professor Conner's prize, as his sketch was one of the best seen at the college for years. His father, the druggist, is now throwing bouquets at his physician-son.

George Budde, the hustling city salesman for the Stein-Vogeler Drug Company, was receiving congratulations from his friends a few days ago on his success in getting the second prize of \$50 for getting the second largest number of subscriptions to the Era. George captured a gold watch from a chewing gum manufacturer a short time ago for selling the largest amount of goods of any drug salesman.

CLEVELAND.

The Cleveland Medical Society has been incorporated.

Umbenauer & Co.'s drug store at Hicksville was raided by burglars.

G. L. Hechler has been elected a member of the Chamber of Commerce.

Jesse Kramer, the Wooster druggist, will wed Miss Lizzie Talbot April 19.

The Enterprise Oil Co., Alliance, is a new corporation with a capital stock of \$50,000.

Chemist R. W. Dickman, of this city, returned from the Columbia mine in Arizona, whither he was sent on an inspection trip.

Among the Cleveland exhibits at the pure food exhibition deserving special attention is that of the Globe Chemical Co. It is managed by R. J. Fuller.

Harry Johnson, whose depositions upon the drug trade have been fully detailed in the Era, was sentenced to the penitentiary for two and a half years.

John T. Meare, Chicago representative of the Sherwin-Williams Co., and W. H. Hogarth, a New York representative of the same company, were recent visitors.

W. H. Park, the Elyria druggist, presented to the Lorain county historical society a volume of the Literary Magazine, published at Elyria 1833-4 by C. A. Park and A. A. Bliss.

Maj. Palmer has introduced a bill in the Ohio legislature reducing the state cigarette tax, wholesale from \$300 to \$25,

retail from \$100 to \$20. The enactment of this measure would practically re-establish the status prior to 1893.

The successors to Wm. Bodebender are Feuer & Aubley. Paul L. Feuer was formerly assistant to Samuel Aubley at his Broadway pharmacy. Mr. Bodebender has left for New York with no definite plans for the future.

Look out for Senator Stillwell's druggists' Dow-law bill; it is an insidious, inquisitorial measure. Some elements in the Ohio legislature are fit to make liquor laws for the state of South Carolina, but are entirely out of place in liberal, enlightened Buckeyeedom. Certain abuses in vogue among "up-to-date" druggists are undoubtedly responsible for this hostile legislative aggressiveness. It's the old story of too much of a good thing, etc., but from this it is not to be inferred that the drug business should be put under a quasi prohibitive liquor tax yoke.

A committee of the Cleveland School of Pharmacy met at their headquarters in the city hall April 9, and passed upon the papers of the pupils who were examined the week previous. The examinations were conducted under the supervision of the committee on pharmacy, composed of E. A. Schellentrager, Dr. J. H. Peck, Dr. E. R. Lane, George W. Voss, Herbert G. Biddle. The officers and faculty are pleased with the results attained, partly due to the extension of the courses inaugurated at the beginning of the term. The special summer course in botany commenced on April 10 with auspicious indications. The course is not obligatory. The rapid progress of the C. S. P. is proof positive of the prestige and fame to which it has attained by dint of happy emulations, original and approved methods, a painstaking and efficient instruction corps and wise management. The successful students are: Senior class—Henry Pollock, Frank J. Hauser, George H. Bruehler, Julius Braein, Frank A. Votipka, Enno Krebs, Herbert E. Edwards, F. E. Rudenauer, John Raus. Junior class—Fred A. Rudolph, Philip F. Cincas, A. B. Phinney, Charles Wagner, J. D. Spring, Harry Loeb, Fred A. Offerowski, Frank Albi, Adolph Riegelhaupt, Albert Mauer, August L. Flandermeier, Theodore Quere, William Killins, Rudolph G. Burkhard, Fred Freitag, Clement R. Baldwin, Emil Petersilge, Theodor Wedler, W. Winterbottom, Edward Bzaki, Jacob Tuslig, Franklin H. Frewin, Julius H. Pinhard, A. L. Sharpe, J. B. Hearst, Edna A. Hoffman, Ray Case, Otto Leopold, E. A. Schellentrager, Jr., Thomas Cahill, Henry W. Brockman, Victor E. Miller.

Strain & Cunningham have sold their store at Oskaloosa, Ia.

Paddock's drug store at Netawaka, Kas., was burned a few days ago.

M. Sarbach has succeeded George W. Simonds at Atchison, Kas.

T. J. Morris has succeeded the firm of Morris & Petro at Beloit, Kas.

Frank C. Herkert has given a \$4,000 chattel mortgage on his store in St. Louis.

Druggist G. L. Bates, of Nebo, Ark., and Miss Laura Phagan, of Bloomfield, Ark., were married recently.

The firm of Napier & Thornton, at Hamilton, Mo., has been dissolved, J. T. Thornton continuing the business.

LOUISVILLE.

Louisville, Ky., April 18.—Druggist Snyder is getting things in readiness for the next annual meeting of the Kentucky Pharmaceutical Association. Mr. Snyder is making one of the most active and efficient presidents the association has ever had, and his efforts have resulted in the material building up of the organization since he took charge. He is anxious that those who have received the queries sent out be in readiness for the meeting, which occurs May 16 at Paris, Ky. The association is representative of the drug trade in Kentucky and the membership is rapidly increasing, showing that dealers realize the importance of having a good organization through which their interests may be brought before the authorities whenever they are jeopardized. In more than one instance the K. P. A. has proved its efficacy. It is probable that a larger delegation will go to the annual meeting from this city than ever before. Everything will be done to insure comfort and pleasure as well as profit, and the hospitable little city of Paris has promised to throw her doors wide open and let the visitors run things to suit themselves. These trips are always attended with pleasures which prove a valuable means of throwing the druggists together in a social way and improving their acquaintance.

It is probable that the next general meeting of the Interstate league will be held in either Cincinnati or Cleveland. Those cities have been working for it as though it were a national political convention. Cleveland especially is on the hustle and Secretary Frick says that the indications are she will get it. Within the past few months, says the secretary, there has been a remarkable increase of retail druggists' associations as a result of the missionary work of the league. The benefits to be derived from membership seem now to be fairly understood, and from every quarter come applications for blanks and information concerning organization and membership in the major association. This speaks well for the enterprise and progressiveness of the druggists throughout the country. It shows that they are wide awake and alert in the interests of their business. With unity of action which is a thing of the near future the question of cutting will be settled finally. The league meeting also occurs in May and the event will be looked forward to with much interest, especially in view of the fact that since last year the organization has increased wonderfully in strength and is prepared to back up its demands with the support of thousands of retail dealers who will stand by the action of its officers and committees. Some idea of the work of the league for the past six months may be of interest, and is here given, the information coming from the secretary, who is in touch with the work: New associations have been formed in Norwich, Conn.; Manchester, N. H.; Portland, Me.; Boston, Brockton, Cambridge, Somerville, Lynn, Salem, Worcester, Springfield, Pittsfield, Lawrence and Kakesville, all of Massachusetts. Other associations have been formed also, but these are the most important places heard from. The members of all the branches of the league in the east have formed what is called the New England Druggists' Union, composed of the officers of all the various branch associations. The object of this union of officers seems

to be the canvassing of the various states and counties and the organization of associations wherever they have not yet been formed. These associations are to assist in the effort of the league to induce manufacturers to sell their goods according to the plan mapped out for the protection of druggists. The Druggists' Union is also to take charge of soliciting contributions from manufacturers, thus taking advantage of the offers made by several large manufacturers. Mr. Henry Canning, of Boston, the president of the league, sends word to the secretary that such interest as is being manifested in the league was never known before and he desires to see the other sections of the country to take hold of the work with the zeal of the east.

The College of Pharmacy will graduate a bright class in July.

John C. Weindel, of Shelby and Washington streets, has sold out his store to Voelker & Co.

The drug business in Louisville has been so slow of late that there have been several changes in the stores. It is rumored that it would take but little inducement to get several owners to sell out.

Dr. Wiley Rogers is missed. He is now a farmer, having moved to a place near Hopkinsville for his health. The doctor is very popular in Louisville and his friends hope to see him come back permanently before long.

The boys were sorry to see Fred Miller resign his post as secretary of the College of Pharmacy. He has many friends and his retirement will be a loss to the college. Mr. Miller was acquainted with every living graduate of the institution.

KANSAS CITY.

Kansas City, Mo., April 18.—The Kansas City College of Pharmacy closed its eighth year with commencement exercises April 3, when a class of sixteen was graduated. The exercises were held in the auditorium of the Y. M. C. A. building. The faculty address was made by Dr. Randall R. Hunter. L. E. Irwin made an address and the degrees were conferred by Dr. Emory Lanphear, president of the board of trustees. The class prizes were awarded by G. H. Willett and the alumni prizes by John C. Maxson, president of the alumni association. The faculty prize, a gold medal, was given to G. Frank Meals. Thomas McPherson was behind him less than one-half of one per cent in grade. The faculty prize for the best work in the junior class was awarded to Charles J. Miller, of Kansas City, with honorable mention to M. S. Middlebrook, of Kansas City.

The alumni medal for the best work in the laboratory was presented to E. E. Ellis, with honorable mention to Gratz E. Dean. The alumni prize for the junior class was given to R. S. Stevens, and honorable mention was made of the work of C. Wilson. The following were the graduates: Edward Ackerson, Kansas City, Mo.; Lorenzo Bennett, Colorado Springs, Col.; Hal L. Campbell, Dallas, Tex.; Fush E. Castellaw, Kansas City, Mo.; Gratz E. Dean, Guthrie, O. T.; Edmond E. Ellis, Willow Springs, Mo.; Charles G. Franzen, Kansas City, Mo.; George R. Gage, Omaha, Neb.; Howard C. Jeffers, Lee's Summit, Mo.; Edward C. Jones, Kansas City, Mo.; Jacob H. Kready, Ortanna, Pa.; Walter A. Lans-

downe, Adrian, Mo.; Thomas E. McPherson, Belton, Mo.; G. Frank Meals, Gettysburg, Pa.; Willard C. Proud, Oregon, Mo.; Charles K. Perrie, Mayview, Mo.

After the close of the exercises the graduating class and the faculty became the guests of the alumni association at a banquet at the Midland Hotel. Dr. Claude C. Hamilton was a clever toastmaster. George R. Gage spoke to the toast "The Class of '94" and Dr. Emory Lanphear responded to a call for "The Faculty." F. A. Faxon, of the firm of Woodward, Faxon & Co., and W. E. King, president of the Kansas City Pharmaceutical Association, made short speeches.

The Kansas State Pharmaceutical Association will hold its fifteenth annual meeting at Salina the last three days of this month. Preparations are already being made for the entertainment of the visitors by the druggists of Salina. The committee on membership consists of M. Noel, Atchison; W. C. Pierce, Pittsburg; T. L. Morris, Beloit; J. W. Hurst, Newton, and H. M. Herrold, Kansas City. Mrs. M. O. Miner, of Hiawatha, is secretary, and with the aid of the membership committee she hopes to double the strength of the association.

E. M. Miller has given a chattel mortgage for \$500 on his stock and fixtures.

Frank Price has switched with his creditors and reopened his drug store opposite the Union depot on Union avenue.

Frank N. Johnson has taken charge of the drug store at the corner of Elmwood and Independence avenues, putting a bright new sign with his name over the door.

Following in the wake of Kansas City the police of St. Joseph, Mo., have banished the slot boxes. Under the Missouri law it is a felony to operate a gambling device.

Sheriff O'Neill has taken possession of the drug store of Elizabeth A. Saeger, 1225 Independence avenue, under a writ of replevin sued out in the Circuit Court by the Meyer Bros. Drug Co., of St. Louis.

The police have discovered a new worker of iniquity, the little slot machine, and an edict has gone forth from the chief that it must go. Many of the machines were rented by drug stores and proved quite a source of revenue from idlers around the cigar case.

Thirty-seven members of the Kansas City Pharmaceutical Association spent one whole day at The Elms, Excelsior Springs, a week ago. After dinner they spent several hours discussing business—and cigars.

George Eysell, proprietor of a drug store on Union avenue, and Henry C. Morrison, formerly proprietor of a drug store on Main street, were both elected members of the upper house of the city council by overwhelming majorities on the Republican ticket.

Franklin D. Palmer and Eugene R. Hess have bought the stock of the Palmer Manufacturing Co., at the corner of Twelfth street and Broadway, from F. R. Dimmitt, the receiver, and will continue the business. Mr. Palmer was formerly head of the Palmer Manufacturing Co., and Mr. Hess was bookkeeper for a wholesale drug house.

Clinton G. Nickella, the former Kansas City druggist, who was arrested in Minneapolis on a charge of adultery with the

wife of Druggist Willis H. Graham, was held to the grand jury after a preliminary examination in bonds of \$1,000. The principals in this case spent the past winter at Wahpeton, N. D., each endeavoring to secure a divorce. The prosecution relied mainly on the evidence of servants in the Graham household, some of whose testimony was very sensational.

The Kansas City Court of Appeals has given the F. R. Rice Mercantile Cigar Co., of St. Louis, a final decree in its suit for injunction to prevent James O'Brien and the James O'Brien Cigar Manufacturing Co., of Kansas City, from infringing its trade-mark rights. The case has attracted much interest, as both companies manufactured cigars especially for the drug store trade. The James O'Brien Cigar Manufacturing Co. is enjoined from making, using or selling any cigars put up in boxes or packages bearing the name "Mercantile," or "Americantile," or "Mericanlente," or any name in such close imitation of the name "Mercantile" as to be calculated to deceive the ordinary purchaser, or from using boxes or labels imitating those of the "Mercantile."

THE SOUTHWEST.

George W. Schott has sold his store at Stanton, Neb.

R. J. Derr has sold his drug store at Fontana, Kas.

T. S. Hinde has succeeded Hinde & Butler at Oregon, Nev.

A. E. Troutman has disposed of his drug store at Lushton, Neb.

C. M. Havice, Rexford, Kas., has given a chattel mortgage for \$500 on his stock.

Ida L. Eber has given a chattel mortgage for \$1,500 on her store in St. Louis.

The drug store of C. A. Kaufman & Co., Avoca, Neb., was closed by the Sheriff.

Taylor & Nash have succeeded the Maryville Drug Company, at Maryville, Mo.

Mack Mahoney has given a chattel mortgage for \$558 on his drug store at Greenwood, Neb.

A cyclone did some damage to J. F. Hoods & Co.'s drug store at Emory, Tex., not long ago.

M. M. Cadey's drug store at Little Rock, Ark., was closed under mortgages not long ago.

A. F. Streit's drug store at Sutherland, Neb., was partially destroyed by fire a few days past.

George Thomas' drug and book store at Cameron, Tex., was recently partly destroyed by fire.

J. R. Dean's drug store was entirely destroyed and R. L. Hall's drug store was considerably damaged in a fire at Elmo, Tex., not long ago.

Burglars broke into the drug store of Vanderlinde & Summers at Maitland, Mo., a few nights ago and robbed the cash drawer of a few dollars, but did not touch anything in the store.

A gasoline stove exploded in a restaurant at Poplar Bluffs, Mo., a few days ago, and a dozen buildings were destroyed in the fire which followed. Among them was L. F. Quinn's drug store, the loss on which was estimated at \$3,000, with \$1,000 insurance.

The Kansas Medical College Building Association, of Topeka, was incorporated a week ago, with a capital stock of \$15,-

000. The directors are J. E. Minney, W. E. Swift, R. S. Magee, S. T. Howe, John Dick, the apprentice, was summoned, Is-Guthrie, H. K. Rowley, F. E. Holliday, L. S. Woolverton, P. I. Bonebrake and P. S. Noel.

L. B. Roberson, proprietor of large dry goods stores in Ardmore, Dougherty and Paul's Valley, I. T., and half owner of a drug store in Ardmore, has filed a general deed of assignment, with preferences, naming Thomas J. Cornelius as assignee. The preferred debts aggregate about \$15,000 and other liabilities \$10,000, and the nominal assets are enough to cover the liabilities.

THE CHEMIST'S CAT.

From sketch by Horace Mayhew. Revised and rewritten up to date.

Mr. Simeon Cifuga was a chemist and druggist—not one of your ordinary fellows who put their trust in colored show-bottles and drive a large trade in confectionery, but a practical chemist; a regular and duly authorized P. I. L., of which fact he acquainted the public by means of an inscription on the sign over his door, and of which his neighbors were continually reminded by various odors and not infrequently explosions. On one occasion he succeeded in blowing the roof off the shed which formed his back shop—but this, he said, "was an accident."

Mr. Cifuga's establishment was not only a museum of pills and plasters, but the home of natural philosophy. Experiments abandoned by every one else were eagerly sought after by him, and he had a valuable auxiliary in his cat. When science slumbered the cat might be found comfortably dozing on the prescription case, but when anything new in chemistry, materia medica or minor surgery turned up, both the chemist and the cat had an active time of it. The poor animal had taken poison enough to destroy every one of the nine lives he was reputed to possess, and antidotes sufficient to restore a regiment. A syringe was kept for his special use. One might generally guess when anything new in experimental science had developed, by missing the cat for a few days and by observing the face of the clerk, who, on such occasions, had slips of diachylon plaster stuck at various angles over his nose and hands; for Dick, the apprentice, had the job of holding the cat during the experiments.

The cat's name was Isaac. In his youth he had been christened Aphrodisiac, but at a very early period in his existence, in consequence of a surgical operation performed by his master, this name had become singularly inappropriate, so Mr. Cifuga dropped the Aphro and called his pet feline simply Isaac.

Isaac had become familiar with arsenic and most of the other poisons in all of their insinuating forms and, as already intimated, he had some knowledge of minor surgery; still he went purring about, ready for any emergency, and was always at hand when any new specimen of the materia medica or doubtful prescription required to be practically tested. Mr. Cifuga was very fond of Isaac. "My cat, sir," he would say, "has done more for his fellow men than all the philanthropists, who have only taught people to be discontented." The chemist, the clerk and the cat got on very comfortably and without any serious cat-astrophe until the indefatigable experimenter thought he

would try laughing gas and see if he could extract a tooth under its influence. The cat, of course, was the especial patient. Dick, the apprentice, was summoned, Isaac caught, and gas administered, while Mr. Cifuga applied his forceps to one of the largest tusks. For some reason the gas failed to produce its proper effect, and by a tremendous struggle Isaac freed himself from Dick's grasp, leaving upon his person several marks of esteem and with a tremendous yowl dashed through the glass of the shop window, doing great damage to the galenic products on exhibition within. He absented himself for a week, but, as the song says, "the cat came back," for no one else would harbor such a mutilated specimen.

Science, which labels men F. R. S. and tags half of the alphabet at the end of their names, had, in several degrees, marked her humble votary, the cat. Isaac had lost one ear in an acoustic experiment. The left eye was gone forever, the result of ocular demonstrations of the properties of various collyria. The right eye, which was still the left one, was very far from being truly right, in consequence of successive applications of atropia which gave to this monocular organ the glare of a Cyclops. Successive trials of depilatories and hair restorers had changed the fur on Isaac's head from its natural gray color to the foxy-red of nitrate of silver. One of his hind legs was shorter than it really ought to be from the tendons having been cut in demonstrating the operation for club-foot; the tip of his tail had suffered from a pair of scissors in an attempt to convert it into a paint-brush; and his coat, once glossy, had acquired a seedy, second-hand appearance which would have repelled an old-clothes peddler.

Isaac at last died a martyr to science. Mr. Cifuga had invented a wonderful pulmonary lozenge containing considerable morphia, which, he claimed, was sure to cure a cough on the rafter. Isaac had been for some time rather asthmatic from the inhalation of various gases, and so he was given a good dose. Next morning he was found fast asleep and very rigid in his legs. Dick thought he was dead, but his master repudiated the idea and administered permanganate of potash till his teeth were as brown as those of a confirmed tobacco chewer but it failed to have any effect, so the cataleptic patient was carefully laid away in the full expectation that he would some day start up, as lively as ever. But he did not start, and it was only when the moths got into his coat that Mr. Cifuga was obliged to consign what remained of his furry friend to a quiet grave in a corner of the garden under a pennyroyal bush.

Mr. Cifuga never regained his usual spirits. His experiments were at an end, for though he would sometimes furtively introduce some drug or other into Dick's tea, he never did it with much interest, and soon the young gentleman found it out and took his meals with his mother.

Poor Cifuga wanders about a melancholy man, and amuses himself by dreaming over experiments he would perform if he only had his cat. He is at times aroused from his musing by the shrill voice of some mischievous boy who opens his back door and calls out "Mister, who killed the cat?"

Our aim is to make the ERA the most complete and valuable of all the drug journals.

NEW YORK COLLEGE OF PHARMACY.

Prof. Chandler's announcement last Friday that the boys would have all their lectures in the new building this week was as unexpected as the bomb in the Chamber of Deputies. That "promised land" for which all have been sighing this whole winter was at last opened Monday at 4 p. m. The students were all on hand in the immense lecture room of the new building. The class of '94, headed by the college banner, was the first to appear and they gave college yells that must have set the neighborhood wondering. Then the professors appeared and some of the faculty and here and there a member of the class of '95 could be seen. At a little after 4 o'clock Dr. Chandler took the chair and made a short address to the students, picturing the College of Pharmacy as it was when he first became connected with it, twenty-six years ago. Then the class met in a single room down in Washington square. In closing his address he said that if this college would take such long strides toward improvement the coming twenty-six years as it had done in the past twenty-six his imagination was not sufficient to picture what the result would be. He then proceeded with his regular lecture on organic chemistry, which was the last one for this term.

After the lecture was over the students visited the other yet unfinished parts of this immense structure.

Section I had its laboratory examinations on Monday from 1 to 3:30 p. m. Section II taking from 1 to 3 o'clock on Wednesday. Here is some of the work done: To make soda benzoate, sodium salicylate, tannic acid suppositories, pills of permanganate of potash, and Burgundy pitch plaster, and to identify alkaloids, trochals, etc.

Dr. Atwood was about for the first time last Friday and was greeted with hearty applause.

Mr. Madison's "Going through the Pharmacopoeia" with the seniors has, of course, been highly appreciated and will surely help some of the boys to pass a more satisfactory examination in pharmacy than they otherwise would.

Among the prescriptions shown at the last pharmacy lecture on incompatibles was the following, written 1,000 years B. C.: Pad of dog's foot, fruit of the date palm, ass's hoof; boll together and apply externally.

PHARMACEUTICAL ASSOCIATIONS.

Indiana Pharmaceutical Association will convene in annual session at Evansville June 13 and 14. The local secretary is George W. Haynie, to whom applications for space for exhibits should be made at once.

Alabama Pharmaceutical Association meets at Anniston May 8 and 9 and the Board of Pharmacy on the 9th and 10th at the same place. Headquarters Wilmer Hotel, \$1.50 per day. All are cordially invited to be present.

The Kentucky Pharmaceutical Association will hold its annual meeting at Paris May 16, lasting three days. Among the important matters to be discussed is the liquor tax upon druggists, and a full meeting of the membership is confidently expected. Paris is in the genuine blue grass country, is full of hospitality, and a good time is assured all visitors.

The Ohio State Pharmaceutical Association will hold its thirteenth annual meeting in Cincinnati June 5-7 instead of the time originally set. Cincinnati will see that the drug fraternity of the state and other visitors receive most hearty reception and be supplied with all to render the occasion a memorable one. Communications regarding hotel accommodations should be addressed to Albert Weststrom, 435 Colerain street, Cincinnati, and requests for other information to Lewis C. Hopp, of Cleveland.

BOARDS OF PHARMACY.

The Connecticut State Board of Pharmacy met at Bridgeport April 3 and examined fifteen applicants.

Georgia Board of Pharmacy holds its next meeting in Americus May 7. At this meeting the board will award prize membership in the A. P. A. The board will hold over to attend the meeting of the Georgia State Pharmaceutical Association, which occurs in that city on the 8th and 9th of May.

The Oklahoma Board of Pharmacy held its regular quarterly meeting for the second quarter of 1894, on April 3, at Perry, and the following were successful in acquiring the required 75 per cent and were registered: Edith Ford, Chandler; John H. Smith, New Ponca; A. B. Webber, Pawnee; Thos. L. Neal, Edmond; Eugene Watrous, Enid. Also three others were registered by virtue of being graduates of recognized schools of pharmacy. Wm. L. Rowland, Langston; Wm. R. McGeorge, Stillwater; C. B. Highbargin, Enid. There were thirty in attendance for examination, but as will be noticed by the number who passed satisfactory examination, a large per cent of those taking the examination seemed to forget that to register as a pharmacist that there would in fact be an examination as to proficiency and have not been brushing up. It is our purpose to raise the standard of pharmacy in Oklahoma, and as the law is intended, place a safeguard around the people, from the uncertain and unintelligent dispensing of medicine. The next meeting will be held at Enid on the first Tuesday in July, 1894.

CORRESPONDENCE.

We accept no responsibility for the views and utterances of our correspondents. Contributions must carry full name and address of the writers, which, however, will not be published, if so requested. Copy should reach us ten days in advance of date of issue.

PROFESSOR KENNEDY REPLIES.

To the Editor:

In March last number of your very valuable journal under the title of "Faulty Teaching" there appears an article which states that a professor in a southern college of pharmacy made some remarkable statements during the delivery of a lecture on incompatibility. "For instance, he said that calomel was incompatible with hydrochloric acid for the reason that the acid frequently contained free chlorine, and the calomel was converted into corrosive sublimate." The critic then goes on to characterize the statement as absurd, and to inquire whether it is any wonder that college graduates often fail to acquit themselves with credit before state boards. If the critic had more opportunities for practical study of the subject, or if he had taken time to look up

such authorities as Roscoe and Schorlemmer, Witthaus, and others of this class, he would have undoubtedly refrained from making an assault upon a statement that has such substantial authorities as those quoted to support it. Under "hydrochloric acid" in Roscoe and Schorlemmer's able treatise the statement is made that free chlorine is one of the impurities found in hydrochloric acid, and Witthaus says that "calomel is converted into corrosive sublimate by hydrochloric acid and by the alkaline chlorides."

The next statement to which my esteemed critic excepts is that "nitrous ether is incompatible with soluble iodides, for instance, with the iodide of potassium, for the reason that iodine is set free owing to the presence of acetic acid." In a tone of disgust he makes what he believes to be a correction of a statement that to his mind could not be made by any one at all informed upon the subject. He enlightens us with the statement that the decomposition is accomplished by the nitrous radical, and tells us that this is one of the Pharmacopoeial methods of estimating the amount of ethyl nitrite in any given specimen." He does not state that the test is only valuable in acid media. The authorities which I have already quoted bear me out in the statement that acetic acid does form in nitrous ether through the oxidation of aldehyde, which is always present in the article found on the shelf of the apothecary, and by virtue of its presence the nitrous radical becomes competent to decompose the iodide. It may be well at this point to call attention to a fallacy in the way of testing this article that constitutes a part of the Pharmacopoeial description of nitrous ether in the edition of 1890. In a paper which I read before the Texas State Pharmaceutical Association in 1887 I called attention to this error. It is the bicarbonate of potassium test for acidity. The Pharmacopoeia states that the preparation should not effervesce when a crystal of potassium bicarbonate is dropped into it. My experience leads me to conclude that this test is of little value in the testing of this preparation for acidity, for the reason of the bicarbonate being practically insoluble in alcohol, and the spirit of nitrous ether is simply an alcoholic solution of ethyl nitrite. The addition of water renders the test of some utility, because it facilitates chemical reaction by effecting solution of the iodide.

If the readers of the Era will take the trouble to look up the authorities on the points of my lecture to which my critic takes exceptions they may readily learn who has erred, and see that the criticism has been unmerited. I do not claim that the printed copy of the lecture which fell into the hands of the Era was free from errors; to the contrary, there were glaring typographical errors and one or two in transcribing. But I do claim that the critic has done more to perpetuate erroneous teaching than a half dozen lectures like the one delivered by the undersigned before the medical and pharmaceutical students of the University of Texas, and would modestly suggest to my esteemed critic, that in the future he thoroughly post himself on the suspected error before he casts a slur upon the learning and methods of professors in southern colleges.

JAMES KENNEDY, Ph. G., M. D.,
Dean of Faculty, School of Pharmacy,
University of Texas.

SHARP & DOHME.

CHAS. A. DOHME.

LOUIS DOHME.

ERNEST STOFFREGEN.

CONSERVATISM is always a safeguard against ultra-enthusiasm, and at the same time is consistent with true, healthy progress. Perhaps no single word so adequately expresses the business character of Sharp & Dohme as this, and certainly it applies with no more fitness to any other manufacturing chemist.

The firm was established in 1860 at the corner of Howard and Pratt streets, Baltimore—the site of their present plant.

From time to time, as the need for more adequate facilities for manufacturing purposes was felt, additional buildings were erected, and in 1892 the entire plant was practically rebuilt, greatly enlarged and completely equipped with the most improved machinery for the manufacture of pharmaceuticals.

Their line is large and varied and embraces in addition to Standard Medicinal Fluid, Solid and Powdered Extracts, Soluble Gelatin and Sugar-Coated Pills, Granular Effervescent Salts, Soluble Hypodermic Tablets, Compressed Tablets, Tablet Triturates, Elixirs, Syrups and Cordials, a full line of high grade Pepsins ranging in digestive power from 1:2000 to 1:20000 and including their well-known Webber-Pepsin S. & D guaranteed standard

1:6000 just twice the standard adopted by the U. S. P., 1890.

S. & D. deserve great credit for having generally introduced Porous Hypodermic Tablets, which are unquestionably much more rapidly soluble and therefore better adapted for subcutaneous use than are Compressed Hypodermic Tablets.

Ergotole is another S. & D. product which has on merit alone won general professional recognition. This is a palatable liquid form of Ergot $2\frac{1}{2}$ times the strength of the official fluid extract, and which we believe can be used hypodermically without causing abscess. It is especially recommended for internal use because of its pleasant taste, small dose and freedom from nauseating properties.

Mr. Louis Dohme, the president of the company, is well known in pharmaceutical and chemical circles. His genial affability and personal magnetism have won for S. & D. a host of warm friends. He continues to be the active general superintendent of the affairs of the company.

Mr. Chas. E. Dohme, the vice-president, a thoroughly practical pharmacist and chemist, has charge of the laboratories

in Baltimore, and personally supervises the manufacturing departments.

Mr. Ernest Stoffregen, the secretary and treasurer, a good financier and a just, courteous gentleman personally, manages the business department from their general offices at 41 John street, New York.

Dr. Alfred Dohme, who is in charge of the analytical department, has enjoyed exceptional educational advantages both in America and Europe, and personally assays the crude drugs purchased for manufacturing purposes.

Each member of S. & D. is a practical man, thoroughly conversant with the most minute details of his department.

The Chicago house is in charge of Chas. E. Matthews & Pro.

S. & D. long ago adopted a business policy which aims to protect both the jobber and the retailer in their mutual relations as well as in their business association with the medical profession.

Their creed is purity of drugs, excellence and uniformity of product and courteous treatment of their patrons, and on these lines they have developed their large and constantly growing business.

The Era wishes them continued prosperity.

TRADE COMMENT.

Bulgarian firms propose to exhibit 150 pounds of oil of rose at the coming Antwerp exhibition.

The Willard Chemical Co., Joliet, Ill., have incorporated for the manufacture of patent medicines, toilet articles, etc. J. P. Thornton & Son, druggists, of that city, are interested in the enterprise.

The A. H. Lyman Co., incorporated, has succeeded A. H. Lyman, Manistee, Mich. The new firm will conduct a wholesale and retail drug, confectionery and stationery business.

The business of W. S. Powell & Co., Baltimore, Md., was incorporated March 21, under the name of the Powell Fertilizer & Chemical Co., with capital of \$45,000 paid up. W. S. Powell is president, and Charles Halzerman treasurer.

A French pharmacist, asked to prepare an emetic of ipecac, supplied extract of opium, the result being that a child patient was put into the sleep that knows no waking. The mother of the child supplied a portion of the medicine to a friend, who in turn using it, caused the death of her own son.

The agents for Richard Brandt's Swiss Pills have placed contracts for \$5,000 worth of advertising with 250 German papers in all parts of the country. These will be followed by similar contracts with papers printed in English text. This will increase the already considerable demand for these pills, which are bound to become a staple article in short order.

Among a large number of valuable prizes given in a lottery scheme authorized by the Tasmanian government, we are told by the Chemist and Druggist, is listed the entire business of a wholesale and retail pharmacy valued at about \$50,000 and another prize is a drug shop and stock worth in the neighborhood of \$6,000. Our contemporary remarks that even if he received the stock and shop for nothing a new comer in the island would need to have all his wits about him to make the business pay.

Even in Algerian drug shops clerks' mistakes occur, but in a recent instance the clerk himself was the sole sufferer. Feeling ill and wishing to take a dose of quinine, he helped himself to a couple of packets from the stock, but by mistake obtained strychnine and died after terrible suffering. His family sued the pharmacist for very heavy damages, claiming that the strychnine ought not to have been kept within reach of the clerk, but upon trial of the case it was decided that the deceased, having taken the article without permission, his representatives could have no right to compensation.

The merchant sat in his empty store and tore his crumpled hair, his teeth were set in his wrinkled face and his eyes wore a glassy stare. "Oh, woe is me," he cried aloud; "oh, cuss me for a chump, a big, raw idiot I have been; and an eighteen carat gump. I thought the people knew me well, my newspaper ad. I stopped, and now below the average, my daily sales have dropped. I've been here years and years, I've grown up with the town, but as soon as I quit my newspaper ad. my sales began to go down. If it's not too late, you bet your life, I now propose to strive, by putting my ad. in the — again, to let the people know I'm alive."

In consequence of a fire on February 21, the Sommer, Lynds & Co., of Quincy, Ill., turned over their entire stock to the insurance companies, and they now announce that they will reorganize and re-open the former business on May 1, under the name of Aldo Sommer's Drug Co. The members of the new firm are Aldo Sommer, Phil Schanz and Charles E. Lionberger.

There has recently been brought out in France, says La Nature, a sort of fancy soap for the use of those who are obliged to do considerable traveling. It is a question of small pieces of paper, slightly larger than visiting cards, covered on each side with a thin layer of ordinary soap or of soap variously colored and perfumed. These soap papers are put into memorandum books, card cases or pocket-books, just as if they were visiting or business cards. Each sheet serves as soap for one time only, and is used like an ordinary cake of soap. In fact, it is an easily carried soap that may be offered to a travelling companion, for every sheet is intact, it having to be used but once. The manufacture of this soap paper is very simple. It consists in immersing sheets of unsized paper in a bath of coconut oil soap, prepared in the same way as for the manufacture of toilet soaps. The strips of paper are dried, and then passed between rollers, in order to render them smooth and give them a handsome appearance. The strips are then cut to the proper dimensions and stamped with such marks as may be desired.

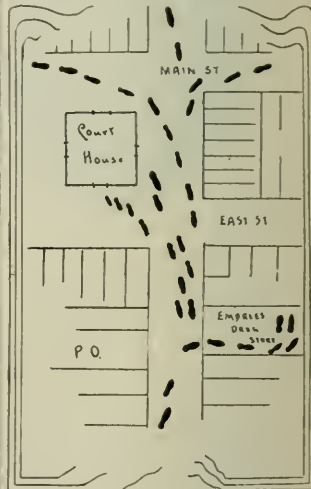

Instead of paper there may be used squares of parchment papers, or better still, of tracing cloth. This industry is still new, and we do not yet know what development is in store for it.

"Trade," of Minneapolis, makes the following remarks upon a subject which is now of considerable interest to the average retail dealer: "The department stores continue to offer a source of discussion to trade journals and to those who are engaged in the old form of storekeeping. They will always be the subject for discussion until the regular stores adopt some of the methods of the department stores, for there are some advantages the latter have which will always make them considerable factors in commerce and strong competitors of the individual stores. Chief among these is the fact that they advertise. To be sure there are many merchants who advertise; but there are very few who advertise as do the department stores. There are very few who keep abreast of the demands of the department stores. And these very demands are created by advertising; that is one secret of the success of the department store—it creates the very demand which it is intended to supply. The various minds and ingenuities of the department store managers are directed primarily to this purpose: To keep their fingers on the public pulse and so far as they can to anticipate the need of that public and when that cannot be done to be ready in the shortest possible time to supply those needs. The department store is not afraid of a new thing because it is new; on the contrary, the moment a new thing is heralded, that moment they are eager to take advantage of the advertising done by the manufacturer or jobber to push a new thing for all there is in it."

[Written for the Era]

JACK EMBREE'S ADS.

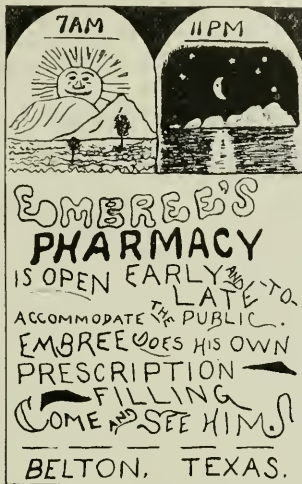

In response to a very general invitation on the part of the Era (one which, by the way, is still open) to retail druggists to submit samples of effective advertising, Mr. A. J. Embree, of Belton, Texas, submits several, made apparently by the zinc-etching process, from which we have selected three which are especially unique, and reproduce them herewith for the benefit of our readers. As Mr. Embree does this work himself, we hope at some future day to give the details of the process used, so that the more ardently inclined of the pharmaceutical fraternity may find scope for their abilities by working along similar lines. In referring to the subject in a general way, Mr. Embree says: "In attempting to say anything about advertising, I do so with a great deal of trepidation, for the reason that I am face to face with the fact that there are men who furnish the press with advertising articles, who have made it a life-long study, yet in spite of this fact I will endeavor to give some of my ideas, which I trust will be of benefit to some brother druggist who, like myself, does not "know

It all," but is willing to learn something, even if it is from a novice in the art (it is an art) of advertising. I think that an interchange of ideas by means of the pharmaceutical press would be the means of developing better business ability on the part of the retail druggist, and for myself I would be glad to see such a course more generally pursued. We, the retail druggists, do not give as much attention to advertising our wares as the importance of the subject deserves. It is really quite a problem, and it should be worked out by all of us as far as practicable. Show me the man who advertises his business in the right way, and I will show you the man who is not grumbling all the time about hard times, and is not finding pit-falls at the half-way mark in all his business journeys. The first thing that I do when my different drug journals arrive is to scan their columns in search of something on advertising. Let me commend the articles that have been pub-

lished in the Era since the first of January under the caption 'Hints on Advertising.' I have found them all well worth careful perusal. My idea in regard to advertising is this: First of all learn to love printer's ink and learn to love it well, then make a contract with a local paper after carefully studying its subscription list and the quality of its press work, for both of these are worthy of careful consideration. Get your position, and let it be next or as near as possible to the "local" columns; engage say five or six inches double column, or about nine or ten inches single column, or it would be a clever idea to alternate, using one space for a month or two and then changing to the other, being careful to keep about the same position, because the people who read the papers will soon know just where to look for your advertisement. Having secured the position, the next thing is to put something in your space that will hold the attention of these readers. The best way I think to do this is to use illustrations, comical or otherwise, and have your reading matter explain in some way the illustrations presented. These illustrations can be procured from most any house that makes a specialty of advertising, or you might do your own engraving as I do, and thus get your advertising at a minimum expense. It matters not if your work is not the fine finished work of the professional, so long as it is odd and attractive and will catch the eye of the people. A few locals now and then help your display advertisements wonderfully. To those who say they haven't time to attend to their advertising I would offer the advice to get some good "ad" writer to do it, as the nominal charge made for such work is quite insignificant compared with the importance of results obtained.

can, and I guarantee you will see a difference in your business in a very short time. It will at least be much better than during the cobweb regime. My observation in window display has been, that something moving in your window is much

7 AM

11 PM

EMBREE'S PHARMACY

IS OPEN EARLY TO LATE TO ACCOMMODATE THE PUBLIC.

EMBREE DOES HIS OWN PRESCRIPTION FILLING.

COME AND SEE HIM!

BELTON, TEXAS.

better than a stationary display, from the fact that a moving figure or object will catch the eye of the pedestrian as he passes, and if you have something nice in your window, he will stop and admire it and perchance will think of something he wants to buy, which he will purchase of you instead of going down the street to the next drug store. Inside the store everything should be nice, attractive and refreshing. Put in palms, ferns or other plants here and there, or have an aquarium well stocked with gold fish. Keep your show cases faultlessly clean, your bottles well arranged on your shelves, treat everyone courteously, try to keep nearly everything in your line of business that is wanted, and you will be well advised and do a profitable drug business."

Regarding the enclosed samples of my advertising, they have been trade winners for me, and I think this style of advertising will prove the same to any one who would be willing to make the effort, and it does seem to me that the retail druggist of the present time should be up and doing, and make the same effort for trade that other lines of business are making."

According to the Florida Citizen the castor bean thrives in that state as in no other part of the United States and is not injured by frost. The plant is almost a perennial, and produces beans at all seasons of the year. It improves the soil that it grows upon and once started, takes care of itself. It is asserted that castor beans can be produced in Florida at less than half the cost that they can in Kansas, and the only reason for their not being grown in the former state is because there are no facilities for manufacturing the oil.

Our aim is to make the ERA the most complete and valuable of all the drug journals.

[Written for the Era.]

BUYING AND TESTING DRUGS

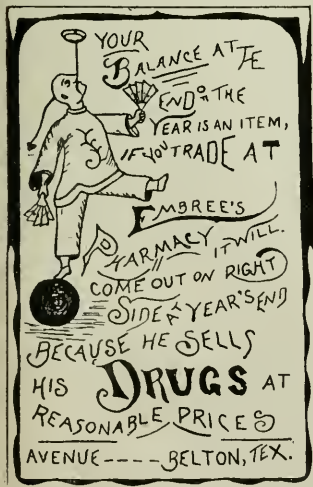

By F. J. Wullling.

In the maintenance of his stock a pharmacist necessarily needs to buy; his purchases may include preparations which he could profitably make himself, or have made on his premises. The scientific and economical pharmacist will invariably make all preparations which may be made savingly, on a small scale, instead of purchasing them; he needs, however, to buy the initial ingredients of all preparations, and in the buying the pharmacist makes or unmakes one of the most potent opportunities for the practice of profitable economy. His purchases are the gateway of financial efflux, and unless made guardedly and judiciously may occasion marked differences in the figures on the debit and credit pages of his books at the end of a month or at the end of any business period.

Judicious buying does not usually mean the purchase of the cheapest goods, or purchasing in large quantities; more frequently it means the procurement of the best to answer the intended purpose, without any special regard for the price. In buying, the first factor is quality, the second, to obtain the quality for the least money. The first may be determined by the application of the tests given in the Pharmacopoeia, the second by personal attention to the market quotations and to the quotations from individual sellers. There are innumerable articles alike in quality, which are quoted at different figures by different houses; there are times of the year when some of the drugs are cheaper than at others, without varying in quality; at times some of the wholesale houses have opportunities or special facilities for buying at better figures than their competitors, enabling them to sell some goods cheaper. Then, buying in large quantities usually enables the pharmacist to get lower figures than by buying as occasion requires. The investment of the larger sum is sometimes not admissible, but if the pharmacist's credit is good he usually has no trouble in buying at 60 or 90 days, at the end of which time frequently enough of the purchase has been disposed of to have yielded a profit which would be good interest for the money invested. Purchasing for cash usually procures lower figures than buying on time, and besides, the wholesale houses usually give a discount of from two to five per cent for cash.

Buying everything from one house is not a good plan, unless one's business is so small that it will not warrant the investment of the money it requires at one time to buy larger quantities directly from the manufacturers. Buying directly from the producers usually saves the jobber's commission, which, in a year's business, as a rule, aggregates quite an item. The wide-awake, enterprising pharmacist finds abundant opportunities for economical buying, and, for the greater part, he personally attends to the purchasing.

After the indulgence of his business capacity in the purchase of goods, the pharmacist, if he is mindful of his and the public's interest, applies his more important, because professional, ability to testing the purchases with a view of ascertaining how nearly they harmonize with the requirements of the Pharmacopoeia. The wise pharmacist will always specify U. S. P. if his purchases are official, and if they are not, he will obtain

YOUR BALANCE AT THE END OF THE YEAR IS AN ITEM, IF YOU TRADE AT EMBREE'S PHARMACY I WILL COME OUT ON RIGHT SIDE AT YEAR'S END BECAUSE HE SELLS HIS DRUGS AT REASONABLE PRICES

AVENUE --- BELTON, TEX.

The next matter of importance in regard to advertising the business of the retail druggist is proper attention to show windows. If you have show windows, for the love of decency, don't let them become full of cobwebs. Clean them out at least once a week and put something in them. Put your displays in as tastily as you

previous to the purchase a statement from the seller regarding the quality or strength of the drug or preparation, upon the condition of the correctness of which he will make the purchase. Serious difficulties have arisen between buyer and seller when the purchaser did not buy conditionally and wanted to return goods after examination; hence it is always a wise precaution to have it understood that goods must be as represented, or if not, that they will be returned. Every article purchased should have individual inspection before being placed upon the shelf or assigned to its accustomed place, but all substances strictly medicinal, official or otherwise, should have especial attention with a view of ascertaining their quality. For the latter purpose an intimate knowledge of the Pharmacopœia is essential. The U. S. P. is the American pharmacists' guide; its place is on the level of the highest achievements of pharmacy; its directions are the best consistent with the high interest and aim of pharmacy; its scope is wide and comprehensive, including nearly every phase of application which the pharmacist has occasion to make in carrying on his vocation in the fullness of its professional nature; its design is to profit the profession of pharmacy and medicine. Every pharmacist's aim is, or ought to be, to work in the line of the highest business and professional development, and to do this an adherence to a standard no lower in order than the Pharmacopœia is imperative, and most pharmacists rejoice in the privilege to measure the standard of their business by the standard of this work. Close allegiance to the latter and the faithful carrying out of its purpose relieve pharmacists of much responsibility, besides facilitating and promoting the conduct of their business.

Adulteration has been practiced by unscrupulous and unprincipled persons until it is almost a perfected art. Those who engage in this nefarious practice are usually very skilled in their abominable purpose to make detection of the fraud exceedingly difficult. Unless the pharmacist is thoroughly convinced, and he cannot always be, that a drug or preparation is strictly U. S. P., he must apply the official tests for identity, purity and strength. In the case of chemicals and many preparations this is comparatively easy; the identity of crude drugs, too, is easily established by reference to the Pharmacopœia. A difficult task it is, though, to detect adulterations in f. l. volatile oils and powdered drugs. The scope of the Pharmacopœia does not include directions for the discovery of adulterations in the latter, probably because of the difficulty of outlining methods which are applicable to all cases, and hence there is a greater incentive to adulterate in this direction. Chemical agents are of use sometimes in the detection of foreign substances in powdered drugs, but the microscope usually affords a better means for detection, and no pharmacist should be without an instrument of this kind in his laboratory. Unless he powders all his drugs himself, or has them powdered under his direction, the pharmacist needs a microscope with which to examine the powders he must purchase. Sometimes a simple lens will be of value, but more often a high power is necessary, especially when the structure of the cells which characterize many drugs needs to be viewed. Not all drugs lose the full-

validity of their cells when powdered, and in this fact there is a means of detecting adulteration. Starch is frequently employed to adulterate with, this of course being easily detected with iodine and the microscope. One, with a little practice, will soon be able to detect matters which are foreign in powders; to become familiar with the microscopical appearance of very fine saw-dust, powdered brick or sand, flour, floor-sweepings, etc., does not require a great deal of practice, but the detection of the thousand and one unknown adulterants is no easy task. It is more easily possible to learn by comparison with a sample of powdered drugs which is pure, than a given sample is adulterated, than to tell with what it is adulterated, and it is usually sufficient to know that the sample is not pure in order to reject it.

The scrupulous pharmacist will employ all means, whether suggested by the Pharmacopœia or not, which his competency and skill afford, to assure himself of the purity and quality of the medicinal agents he keeps in his establishment, and he will spare no effort to maintain the uniformly high standard which the Pharmacopœia fixes for the substances it embraces, and to apply the principles inherent in it and suggested by it to drugs and preparations which are not official. A pharmacist should not refrain from applying appropriate tests in particular cases because these might not be contained in the Pharmacopœia. The latter, however, provides for most cases; and when it does not, as in the instance mentioned (powdered drugs), other references should be consulted, or original work entered into by the progressive pharmacist. Some pharmacists state that it would take too much of their time were they to test all their purchases, or the products of their laboratories, according to the U. S. P. or any other directions, and that they have enough confidence in the sellers to make special investigation by them unnecessary. This sentiment has lately been unhesitatingly expressed to the writer, and there is no doubt that it voices the disposition shown by many pharmacists toward testing purchases. This is an unsound sentiment, and the expression and carrying out of this temper of mind are the result of incomplete and perhaps careless reflection upon the responsibilities resting upon the pharmacists, and especially upon those who would make light of their duties to themselves and to the public.

The plea that it requires too much time to test purchases is never made by a pharmacist who stops long enough to carry the thought to its end—that the application of the pharmacopœial tests for both the identity and purity of drugs is one of the primal factors in the pharmacist's self-protection and preservation; it is a necessary agent in the survival of the fittest. The pharmacist who will not throw this barrier of protection around himself, is, to say the least, near sighted concerning his own interests and inferentially concerning the public's. The other sentiment, that which reposes enough confidence in the seller to render testing superfluous, is a more ideal one, but it, too, falls far short, because it neither serves the purpose of the expression of confidence, nor does it protect from or relieve the pharmacist of responsibility in any manner. The personality of buyer and seller has nothing whatever to do

with the question; it is supposed that the faith of both is good, but both may make serious mistakes in good faith if they do not adopt all necessary caution in the manipulation of drugs and medicinal agents. That kind of good faith is unavailing. The ever present question which confronts the conscientious pharmacist is, how he can reduce the burden of responsibility to a minimum, and surely the reliance upon those selling him drugs for the latter's identity and quality is not the solution of the question, notwithstanding, that the seller's integrity and verity are unimpeachable. In whose experience is there not a record of a mistake, of little or great importance, made by the jobbers or manufacturers? It is not censuring these latter by alluding to this fact—mistakes or unintentional errors practically cannot be avoided, notwithstanding that usually the very best and improved methods are employed by the manufacturers for their avoidance. The jobbers, too, employ very careful business methods, but they are mediums buying from the producer and selling to the retailer, usually selling their goods upon the representation given by the manufacturers, hence the pharmacist has no guarantee in them. The question, considered from all points of view, will solve itself in no other manner than by reflecting upon the individual pharmacist the necessity, in self defense, of rigidly following the directions of the Pharmacopœia, and perhaps of other authorities, in the matter of establishment of the identity, purity and strength of medicinal bodies. The pharmacist must himself shoulder the responsibility; he cannot afford to trust it to, or discharge it upon, those from whom he purchases.

The tests, physical and chemical, given by the Pharmacopœia, are the simplest consistent with the purpose for which tests are intended, and their execution ought to be within the range of every pharmacist's ability. It is not the province of the Pharmacopœia to explain the nature of the tests it contains, but those whose knowledge of chemistry does not extend to the interpretation of the chemical phenomena involved in these tests can easily learn the needed explanation by reference to the many text books. Those who, with the aid of text books, lack the ability to apply and understand the Pharmacopœial tests, have not yet developed to the standard which the profession requires of them, and they must submit to be relegated to the incompetent class.

To those pharmacists who have not applied the Pharmacopœial tests, the rigid application of them will reveal a state of things which will lead to conviction of the necessity for constant and vigilant use of all possible means of detecting adulterations, impurities and deficiencies of strength.

The simplest, and usually the first in order of application, are the tests for identity; these may be the physical tests of tasting, smelling, ascertaining the solubility, density, etc., or the chemical tests for the base and acid, or both. It is not infrequent that mistakes are detected in this manner. From a record kept by the writer, the following extracts, which probably any experienced pharmacist could duplicate in number, will show the utter fallacy of the confidence-in-the-seller sentiment:

PACKAGES LABELED.	CONTAINED.
Potassium Chlorate.....	Potassium Chloride
Silver Nitrate, Fused.....	Silver Nitrate, Diluted
Barium Nitrate (for pyrotech- nics).....	Sodium Nitrate
Sodium Hyposulphite.....	Sod. Hypophosphite
Oleate Mercury.....	Oleate Quinine
Cotton Seed Oil.....	Linsed Oil
Coppers (barrel).....	Glauber's Salt
Peppermint (ounce pks.).....	Spearmint
Cypridinum.....	Flint Root
*Rochelle Salt (50 lb. box).....	Tartaric Acid
Licorice Root (powdered).....	Ipecac (powdered)
Comp. Extract Colocynth.....	Extract Jalap
*Oil Lemon.....	Oil Anise
Nitric Acid C.P. (1 lb. org. pkg.).....	Hydrochloric Acid
Mercury Cyanide.....	Potassium Cyanide

These mistakes were detected in a period of a little less than six years, during which time every purchase was submitted to a rigid examination. The list speaks for itself; a survey of it will show that, as a rule, the mistakes were in labeling, and there was a similarity between the bodies mistaken, indeed this is the case in all instances, excepting, perhaps, mistaking oil of lemon for oil of anise. In all cases, excepting those marked *, the bodies indicated on the label were ordered. Those marked * were sent instead of the substances indicated by the names opposite. How the mistakes happened, by whom they were made and that others are being made constantly, is the ghost that will not down, and which stares threateningly in the pharmacist's face. This is nearly as dangerous a species of mistakes as those sometimes committed in dispensing and fully equaling them in the possibility of dire results. While a mistake in dispensing is usually a single one, the mistakes referred to are initial, frequently leading to a multiplication before the error is detected, and it takes all the longer in these cases for the error to be discovered because the detection is not usually the result of investigation but of accident. Any process of reasoning leads to the conclusion that the pharmacist must in self-defense apply tests for identity to the drugs he purchases.

Just now a perusa. of the editorial page of the Era of March 15th brings to the writer's notice a mistake of the nature of those just discussed. The unfortunate circumstance strengthens the argument in favor of testing drugs and chemicals at least for identity, and forcibly illustrates the woeful possibilities which may result from negligence in this direction.

The tests for purity and strength are of less importance, in a sense, than the tests for identity; of less importance only because the omission of their application would in nearly all cases not contain so much possibility of harmful result. The pharmacist who would not test his calome for corrosive chloride, his bismuth salts and sulphur and mineral acids for arsenic, his sodium and potassium iodide for iodate, etc., would be endangering some patient's health and his own reputation; the pharmacist who would not test his spirit nitrous ether for strength of ethyl nitrite, his cinchona and opium for alkaloidal strength, his potassium and sodium bromides for more than 3 per cent of chloride, his powdered drugs for adulteration, etc., would not be judicious in his economy, and would perhaps be negligent at the expense of some patient.

Time and space will not permit enumeration of the vast array of instances of the discovery of adulteration, deficiency in strength, and impurities, of

which records are at hand, nor is it necessary in an article like this, whose purpose is to arouse in some pharmacists the latent energy to apply the tests, rather than to tell them how to apply them or to convince them of the wisdom of the employment of all possible precautions to avoid mistakes or to lessen their own responsibility.

NITRIC ACID.

Below is a portion of an address recently delivered by Professor George F. H. Markee, of the Massachusetts College of Pharmacy:

Nitric acid was known to the old alchemists, who manufactured it and became familiar with most of its characteristics. In 1875, Cavendish, an English chemist, determined its constituents and made it out of its elements. It is a chemical combination of nitrogen and oxygen, atmospheric air being a mechanical mixture of the same materials. If an electric spark is passed through the air its effect is to combine chemically the nitrogen

and oxygen there present and a quantity, smaller or larger, of nitric acid is made in many ways, by flashes of lightning and from the decay of animal or vegetable tissues. This percolates through the soil and thus various nitrates are formed. Formerly India produced the greater part of the nitre of commerce, it being the province of one caste of the Hindus to care for the sewerage of the towns and villages and to produce therefrom the nitre.

The great storehouse of the world of nitrates at present is in the great desert of Atacama, in Chili, popularly known as the Chilian nitre beds. The district was so valuable that it was practically the cause of a recent war between Chili and Peru. The country is without rain, and from the accumulation of refuse from birds and animals, the soil is heavily charged with nitrates. The earth is excavated on an enormous scale with the most improved machinery, the earthy matter being eliminated, and a product, known as Chilian saltpetre, is produced by a very low rate. By a simple and inexpensive treatment with some of the Stassfurt minerals, the more valuable true saltpetre is produced. By the old way of making nitre, the results were sometimes very successful and sometimes total failures. Late investigations, however, show this very interesting fact, that one of those minute vegetable growths, known as bacteria, is a necessity for the production of nitre from refuse. The scientific nitre maker looks for this bacterium and sows it just as carefully as the ordinary farmer does his seed. In fact, this discovery has a strong bearing on matters agricultural, for the need of nitrogenous elements in a soil which is to produce crops is well known.

The Herf & Frerichs Chemical Co., of St. Louis, manufacture a full line of pharmaceutical and photographic chemicals and have developed a large and still quickly growing business since they started six or seven years ago. In addition to their bromine and iodine preparations, their subnitrate bismuth and sulphuric ethers, which are favorably known amongst the trade and are winning new friends for their many other chemicals day by day, they are large manufacturers of salicylic acid, synthetic oil wintergreen, a perfectly white salicylate soda, acetanilid, U. S. P. crystals and fine impalpable powder, etc. Their salicylic acid is not only equal to any of the imported brands but is always uniformly snow white and pure, melting at 157 deg. C, which none but the purest acid will do. With such an excellent quality of American salicylic acid, which has been used for a number of years with the utmost satisfaction in all parts of the country, ever consumer should favor this American make and specify H. & F. in all his orders. For the convenience of their eastern friends they carry a stock of salicylic acid, oil of wintergreen, acetanilid, and other leading specialties at their warehouses and office, 96 Fulton street, New York.

B. FRANK GODDARD, Lynchburg, Ohio.—I think the ERA is the most complete magazine of any published, and your articles are immense. I can cheerfully recommend the Era Key to the U. S. P. to all physicians. Accept my thanks for the Era Dose Book, as it is quite an aid in the prescription counter.

D. HORN, JR.

CASH PRIZES TO AGENTS.

In the fall of 1893 we offered to the agents of wholesale drug firms special inducements to solicit subscriptions for the *Pharmaceutical Era*. The contest closed March 1, 1894, and we are now pleased to announce the results, with portraits of the five agents standing highest in the list.

The special cash prize of \$250 to the agents taking the largest number of subscriptions, was won as follows:

- First prize, \$100—David Horn, Jr., Smith, Kline & French Co.
 Second prize, \$50—Geo. Budde, Steinvogeler Drug Co.
 Third prize, \$30—D. A. Harrison, Farrand, Williams & Clark.
 Fourth prize, \$20—J. I. French, Gilman Bros.

Jobbers Purse.

The "Jobbers' Purse" amounted to \$66.98, divided into four prizes, and was won by the following gentlemen:

- First prize—J. I. French, Gilman Bros., \$33.49.
 Second prize—D. A. Harrison, Farrand, Williams & Clark, \$16.75.
 Third prize—David Horn, Jr., Smith, Kline & French Co., \$10.05.
 Fourth prize—J. Schreiderer—P. Van Schaack & Sons, \$6.69.

Payments for the prizes have been made to the different parties, as per their published receipts, which we give below.

It seems very appropriate that we should say a few words in regard to the successful contestants, pictures of whom are given herewith.

Acknowledgements

Cincinnati, O., April 10, 1894.
 Messrs. D. O. Haynes & Co.,
 Detroit, Mich.

Gentlemen:—Your favor of the 7th inst., enclosing check for \$35.28, being 5 per cent. of order and second prize to agents of wholesale drug firms, duly received. To say that I was agreeably surprised was putting it very mildly. I can only thank you for your promptness in this matter and you can rest assured that I will do my utmost to advance the interests of the *Era* in this section and help to maintain it as the standard journal in the drug trade.

Wishing you success in your new field of labor, I remain

Very respectfully yours,
 GEO. BUDDE.

Harrisburgh, Pa., April 9, 1894.
 Messrs. D. O. Haynes & Co.,
 Dear Sirs: Yours of the 7th, containing check for \$10.05, received to-day. Kindly accept thanks.

Thanking you for your kind congratulations, and hoping that in the future I may be able to further the interests of the *Era*, I remain

Very truly yours,
 DAVID HORN, JR.

Kalamazoo, Mich., April 12, 1894.
 Messrs. D. O. Haynes & Co.,
 Detroit, Mich.

Gentlemen:—Your favor of the 7th inst., inclosing draft for \$46.75 for cash prizes, is received. Many thanks.

I am pleased that my efforts in your behalf came so near the first among all who entered into competition.

Yours truly,
 D. A. HARRISON.

GEORGE BUDDE.

Chicago, April 14, 1894.
 Messrs. D. O. Haynes & Co.,
 Detroit, Mich.

Gents:—Yours of recent date enclosing check for \$6.69 as fourth money on your "Jobbers' Purse" duly received, for which please accept many thanks.

Your humble servant,
 JOHN SCHEIDERER.

D. HORN, JR.

Mr. Horn, winner of the first special cash prize for the largest number of subscriptions, and of the third portion of the "Jobbers' Purse," is a product of Philadelphia, in which city he was born and raised. He entered the drug business in 1863. He has been traveling in the interests of Smith, Kline & Co., and of the Smith, Kline & French Co. since February, 1878, this being his seventeenth year of service with them. His success as a traveler has been very gratifying, and he is credited with having a larger share of the drug trade of Pennsylvania than any other traveler in that state. We present few facts relative to his personality, as his acquaintanceship is large, and, farther, his career has been not uneventful, perhaps, but confined within the

limits of the single trade in which he has always been engaged.

GEORGE BUDDE.

Mr. Budde is connected with the Steinvogeler Drug Company, of Cincinnati, and is the recipient of the second special cash prize awarded by the *Era*. He is 33 years of age and has lived in the Queen City nearly all his life, for the past fifteen years having been identified with the drug business. He received a common school education and at the age of 13 entered the law office of Howard Douglass, with whom he remained for five years. Finding Hackstone too monotonous, he decided to enter mercantile business and connected himself with the firm of R. Wurlitzer & Bro. Here his first position was as assistant book-keeper, and later he was made city salesman, in which capacity he served until two years ago, when he entered the employ of the drug house with which he is still connected. Here he is the manager of the druggists' sundries department and enjoys the confidence of his firm and the cordial friendship of its patrons. He is married, the father of three children, and occupies a pleasant home at 228 Laurel street.

DWIGHT A. HARRISON

Mr. Harrison is the recipient of the third cash prize and the second portion of the "Jobbers' Purse." He is a native of Lenawee County, Mich., where he was born in 1847. He received a good education, and in 1868 a diploma from the Michigan Agricultural College. In the spring of 1869 he began the drug business in the store of the Hon. Frank Wells, with whom he remained two and a half years. In 1871 he entered into partnership and Wells & Harrison conducted a store at Williamston, Mich., for nine years. The close confinement of the drug business, with its long hours, began to affect his health, so much so that he disposed of his interest in the Williamston store and took a position with Farrand, Williams & Co., of Detroit, to represent them in central and western Michigan. When the organization of the present firm of Farrand, Williams & Clark was effected, he went with them, receiving his old territory, which he still covers. His practical experience in the drug trade covers a period of twenty-five years. He calls Kalamazoo his home.

DWIGHT A. HARRISON.

JOHN SCHEIDERER

This gentleman receives the fourth portion of the "Jobbers' Purse." He was born January 31, 1866, in Milwaukee. His entrance into the drug business was in 1883, and he served in a retail store until 1888, when he entered the employ, as salesman, of the wholesale drug firm of F. Dohmen Co., continuing in that capacity for about a year, then removing to Chicago, where he received a position with Peter Van Schaack & Sons, where he still remains. He has some little side ventures, notably being a joint owner of the Berlin Chemical Company, which manufactures the well paying specialty, German Vermiline, an efficient insecticide.

J. I. FRENCH.

Mr. French is the winner of the fourth portion of the special cash prize for subscription orders, and ranked first in the total amount of orders. He is in the service of Messrs. Gilman Bros., of Boston, representing them in eastern territory. We regret Mr. French's portrait was not received in time to present on this page, but a subsequent issue will contain it, with a more extended biographical notice.

GENERAL DIRECTIONS FOR MICROSCOPIC WORK.

1. Acquaint yourself thoroughly with the mechanism of the microscope you are to use.
2. Observe great care in the removing and putting on of objectives, so as not to drop them, for they are delicately constructed and liable to injury. The eye-pieces and eye-piece micrometer should also be handled with care.
3. Observe care in focusing, particularly when high powers are used, so as not to run the objective down against the slide and endanger either the cover-glass or the objective itself. Be sure also that you focus the microscope accurately, otherwise the structure of the object will not be distinctly seen.
4. Give due attention to the adjustment of the reflecting mirror, so as to secure the most favorable illumination of the object. Much of your success in seeing fine details of structure will depend upon the care exercised in this respect.
5. Bear in mind that many of the reagents used are corrosive and hence

should not be brought into contact with the microscope. All the acids and iodine reagents will act upon brass work, potassium hydrate will corrode glass, and alcohol will remove the lacquering from the stand.

6. All objects examined in liquids should be covered, not only to obviate the danger of injuring the objective, but to avoid the inevitable distortion of the image which a curved or uneven liquid surface produces.

7. Let cleanliness and care characterize all your work in the microscopical laboratory. Keep all your apparatus, slides, cover, glasses, etc., scrupulously clean. Do not touch the glasses of the objectives or eye-pieces with your fingers, for that would be to soil them and impair their optical performance. Whenever they need cleaning, breathe upon the glasses and wipe them either with a piece of perfectly clean and soft linen cloth, or with a piece of the thin, soft paper that is sold at dental supply stores under the name of Japanese filter paper. A convenient way is to keep always at hand, in a place secure from dust, a quantity of this paper cut into suitable sizes. It is useful, also, for cleaning cover-glasses, slides, etc. If a fresh piece is used each time for cleaning an objective, there will be little danger of marring the polish of the front lens.

Keep the bottles containing reagents, staining fluids, etc., stoppered when not in use, so as to exclude dust and prevent evaporation; and take special care in using them not to introduce impurities into them.

8. In cutting sections, the razor or section knife should always be very sharp, and for most purposes sections should be cut quite thin. Steadiness in cutting is secured by resting the wrists against the body. The knife should be given an oblique or sliding motion when drawn through the object. Quite hard tissues may be successfully cut if the sections are cut quite thin, but if the edge of the knife is allowed to run too deep, it is liable to be notched. Portions of thin structures like leaves, petals, etc., may readily be sectioned by placing them between pieces of elder or sunflower pith. Always clean the knife after cutting with it, and do not allow fragments of tissue to dry upon it. Sections of fresh tissues, or of those that have been preserved in any of the preservative fluids, should immediately be placed in liquid after cutting, to prevent air from getting into the cells.

9. In all your work with the microscope, proceed understandingly. Endeavor to know the reason for every test you are called upon to apply, and be careful in interpreting the results of each test. Do not rest satisfied until you thoroughly understand every tissue and structure given you for study.

10. It is excellent practice for the student to keep an accurate record in writing, and by means of drawings, of all the facts observed and the work done by him in the microscopical laboratory.—Bastin's College Botany.

THE ODOR OF BENZOIC ACID.—Benzoic acid is said by Passy to be odorless when pure and alone, but if diluted with any medium a characteristic odor at once reveals itself.

J. E. BROWN, Cairo, Ill.—There is nothing about the ERA I do not consider first-class.

VEGETABLE FERMENTS.

Mr. J. R. Green in *Annals of Botany* (Science), has a long paper on vegetable ferments, embodying a digest of the present state of our knowledge. "Provisionally," says the author, "these bodies may be classified according to the materials on which they work. We may thus make four well-marked groups, excluding those which are obtainable from micro-organisms, as well as one or two whose action has not been thoroughly investigated. These groups will be: (1) Those which attack carbohydrates. These will include the different varieties of diastase, the ferment transforming inulin, the invertase which breaks up cane sugar, the cytohydrolysts attacking cellulose, and the ferment which forms vegetable jelly from pectic substances. (2) Those which decompose glucosides, with formation of sugar and various aromatic bodies. Of these the best known are emulsin or synaptase, myrosin, erythrozym, and rhamnase. (3) The proteolytic group, including vegetable pepsin, trypsin, and rennet, resembling very closely the animal enzymes bearing the same names. (4) The enzyme that decomposes oils or fats." The common or translocation diastase has a wide distribution in plant cells, and Baretzky suggests that it is universally present so long as the cells are living. It slowly dissolves starch, converting it into sugar.

A more active form known as diastase of secretion destroys the starch grain by corrosion. It occurs in various grains, but only at the commencement of germination, being apparently secreted by the epithelial cells of the scutellum, but according to Haberlandt by the aleurone layer in the barley grain. Inulase occurs in the artichoke, dahlia and various other compositae. It first appears in the germinating tubers, converting the inulin into sugar. Invertase occurs in a variety of vegetable substances,—yeast, bacteria, fungi, malt, buds and leaves, pollen, grains, etc. It has the power of inverting or hydrolysing cane sugar into dextrose and laevulose. It occurs also in animals. A cytohydrolytic ferment probably occurs in the endosperm cell of palm seeds, but no one has yet been able to isolate it. The author cites De Bary's well-known experiments on the extrusion of a cellulose dissolving substance from the hyphae of certain Pezizae, and Marshall Ward's on the lily *Botrytis*, and thinks that such bodies are not exceptional in the vegetable kingdom. Brown and Morris have discovered a similar enzyme in germinating barley grains. Pectase occurs in a variety of plants, carrots, beets, fruits, etc., and has the power of converting cellulose into gum. Emulsin occurs in certain Prunoidae in the vicinity of the fibro-vascular bundles. It decomposes amygdalin into sugar, benzoic aldehyde, and prussic acid, and also decomposes many other glucosides. Myrosin is the characteristic enzyme of the Cruciferae, but is probably not confined to this order. It breaks up the very complex glucosides abounding in Cruciferous plants into sugar and certain strong-smelling compounds generally containing sulphur. This enzyme occurs in special cells variously distributed. The strong smell of black mustard seed when bruised and covered with water is due to the liberation of sulphocyanate of allyl from contact of this enzyme with the glucoside, sinigrine, contained in other cells of the seed. Rhamnase occurs in the seeds of the Persian berry, *Rhamnus infectorius*.

It decomposes a glucoside, xanthorrhainin, into glucose and a bright yellow dye, rhamnetin, the glucoside occurring abundantly in the pulp of the fruit and in the pericarp. Attention was first drawn to this enzyme by the discovery that decoctions of the pericarp alone would not produce the dye, but that it developed at once when mixed with a little of the crushed seed. Subsequently Marshall Ward found out that the enzyme was located in a very small part of the seed, viz., the raphe, and that no other part of it would decompose the glucoside and produce the dye. Erythrozym occurs in the madder root, and there are yet other glucoside-enzymes, but less well known. Pepsin, or ferment, very closely resembling it, and provisionally to be classed with it, occur in *Drosera*, *Dionaea*, *Pinguicula*, and other insectivorous plants. Probably the ferments found in *Nepenthes*, *Sarracenia*, and *Aethalum aptium* come also along here. They are capable of dissolving proteids, connective tissue, cartilage and gelatine, and are most active in a slightly acid medium, strikingly resembling in these particulars the pepsin of the stomach. Trypsin, capable not only of converting proteids into peptone, but also of breaking up the latter into amide bodies, occurs in the pawpaw (*Carica papaya*), the fig, and a melon (*Cucumis utillissimus*), the natives of India having for a long time made use of this fact by cooking certain fruits with tough meat to make it tender. A similar enzyme exists in the juice of the pineapple, in the seeds of vetch, hemp, flax, barley, castor beans and lupins, at the time of germination. Dacommo and Tommasi have also described a proteo-hydrolytic ferment from *Annakallis arvensis*, the fresh plant disintegrating fresh meat or fibrin in thirty-six hours when kept in contact with it at 69° C. Rennet occurs along with trypsin in commercial papain, in the juice of the pineapple, and in the seed of *Ricinus*. It has also been extracted in recent years from a variety of seeds, some before and others during germination. Lea has given quite a full account of its preparation from the seeds of *Withania coagulans*, a Solanaceous shrub of Afghanistan and northern India, and the author has found it in seeds of *Datura Stramonium*, *Pisum sativum*, *Lupinus hirsutus*, etc. It also occurs in the pericarp, pulp, and expressed juice of the ripe fruit of the *Naras* (*Acanthosicyos horrida*), a Cucurbitaceous plant of South Africa. The power of curdling milk also exists in the flowers of *Gallium verum*, a plant still used in west England by cheesemakers; in the leaves of *Pinguicula vulgaris*, first noted by Linnaeus, as in use by Lapland tribes for this purpose, and said by Pfeffer to be still used in the Italian Alps; in the glands of *Drosera*, noted by Darwin; in the stem of *Clematis vitalba*; and in the petals of the artichoke. Fatsplitting enzymes have been discovered in seeds of *Ricinus*, rape, opium-poppy, hemp, flax and maize. In the castor bean it is distributed throughout the whole endosperm.

These ferments seem to arise from vegetable zymogens, the existence of which was first established by Vines in experiments on *Nepenthes*. The constitution of enzymes is still in dispute. Loew, as the result of analysis, considered them to be proteids closely allied to the peptones, but spectrum analysis and other evidence has now made this doubtful. Vegetable ferments are readily destroyed by boiling,

and are for the most part very sensitive to acids and alkalies, a slight excess destroying them or stopping all action. They are not readily identified in tissues by use of stains. Some are very unstable. Enzymes have very slight power of diffusion. They can make their way through cell walls, but not through the parchment walls of dialyzers. They appear to act in an ordinary chemical way, causing hydration (myrosin excepted) and subsequent decomposition. Most of the changes brought about by enzymes can be effected in the laboratory by ordinary chemical processes. They are extracted for experimental purposes by water, salt water, or glycerine, and are quickly precipitated by excess of alcohol. One of their most striking peculiarities is the enormous power of conversion they possess, a sample of invertase being capable of inverting 100,000 times its own weight of cane sugar without injury to itself. The ferments of the fungi and bacteria are also enzymes, and the old view of Naegeli that there are two distinct classes of ferments, organized and unorganized, is no longer tenable. Enzymes have been isolated from a number of bacteria, and even several from the same organism,—in case of the potato bacillus, *B. mesentericus vulgatus*, no less than five, viz., diastase, invertase, rennet, a proteo-hydrolytic enzyme and one destroying the middle lamella of vegetable cells.

ATMOSPHERIC NITROGEN.

One of the most important experiments in economic agriculture has been undertaken by the Illinois experimental station, says the American Cultivator. Its object is to discover whether the excrescences which naturally form on the roots of clover, peas and other leguminous plants, and which enable such plants to decompose the atmosphere and use its nitrogen, may not be also made to grow on corn, oats and other plants of the grass family. If this can be accomplished it will be possible to make corn, oats and wheat renovating crops, as clover and peas now are. The process of experimenting is to inoculate corn and oat roots with the bacteria taken from the warts on the roots of clover. This must be done gradually, as the bacteria from clover will not live if given at first an entirely different kind of plant to feed on. The bacteria are propagated at first in a culture media, only a portion of which consists of watery solutions of clover.

So far the experiments have entirely failed on oats, but they have been partly successful on the roots of Indian corn. The corn plants whose roots were inoculated were slightly more thrifty and had more fine roots. It was bacteria from a corn extract that was tried upon oats. Perhaps if an oat extract had been used for propagating the bacteria inoculated in that plant it also would have been a partial success.

It will be interesting to note if we can give individual plants of corn or other grains the power of appropriating atmospheric nitrogen, whether the great modification in the nature of the plant thus made will be continued in plants grown from the seed. Unless this can be done the discovery will be of more speculative than practical interest. If it can be done its practical importance will be greater than almost any other discovery of recent times.

FREDERICK F. INGRAM & CO.

This firm is one of the important factors in the making of Detroit's reputation as a great center in the business of manufacturing pharmacy. The active conduct of its business devolves upon the senior member, Mr. Ingram, who was born at Hastings, Mich., in 1856. His experience in the drug business has been that which comes from service in the several capacities of clerk, proprietor of retail store, traveling salesman for a manufacturing drug concern, and as part proprietor of a small manufacturing business, which has, in less than ten years, grown through energetic methods into a large one, which is widely known to the drug trade of the country. The business was established in 1882, and the present plant and offices of the firm are located at 37-39 West Larned street, occupying an imposing structure of brick and iron, six stories high, with a floor space of 23,000 square feet. The establishment is fully equipped with all the modern appliances for economical manufacturing, and the products of the firm embrace everything which the terms "manufacturing pharmacists and perfumers" imply. Besides the making of standard preparations, the firm is widely known through their specialties, the most famous, perhaps, of which are "Wing's Perfumes." This line of fine odors, introduced in 1883, has so grown in favor, that their sales have quadrupled within the last three years. This firm long ago discovered that people want something new, even in medicines, and their efforts have always been to fill this demand, as is shown by the many novelties and new preparations which they are constantly offering the trade. This feature of their business is recognized both by the offering of new and improved formulae, and in the continued improvement in the styles of putting up their goods, so that the retail trade is getting quite in the way of sending for some of Ingram's "new wrinkles" whenever times are hard, and the trading appetite of the public needs stimulation. One of their latest products in this line is a cachou, called "After the Ball," and as an illustration of "what's in a name" they find they can hardly make them fast enough to fill orders. This firm also has an extensive trade in "non-patent" domestic remedies, and the catalogues and "Poison and Liquor Register" which they distribute free, are fine samples of typographical art. In addition to their Detroit house they have branch offices at 110 Randolph street, Chicago; 258 Washington street, Boston, and 225 North Ninth street, Philadelphia.

THE EXECUTIVE STAFF OF FREDERICK STEARNS & CO.

FREDERICK STEARNS & CO., DETROIT.

IN considering the gradual development of our modern industrial system, it is a matter of considerable interest to speculate as to the period when the first perceptions of the economy of the distribution of labor began to dawn upon the mind of the human race. This thing that is now so plain to us—the superiority of one man and a machine over a large body of men—is something that has come to us by degrees, each year seeing an increase of the machine and a decrease in the expenditure of manual effort in the making of things. Instead of every man grinding his own flour and baking his own bread, ten men grind the flour for ten thousand, and another ten men can bake it. The same plan operates in the fabrication of our shoes, clothing and other necessities and conveniences of life, and there is no reason why it should not apply to the making of our pills.

Our last census gave us some astonishing figures upon the manufacture of drugs and chemicals in this country, these of course including much material used for technical purposes, but at the same time, the consumption of those agents which, to borrow a term of our medical friends, are used to "assist nature" in curing us of our ills, is something enormous, and naturally gives rise to the question, what creates all this value and where does it all come from? With the general public the answer is quite easy—the material comes from the drug store and the druggist receives the money for it. The apothecary could answer for himself by saying that certain things come from the Indies, the South Sea Islands, Timbuctoo, or the depths of the sea, as the case might be, but he would realize at the same time, as he looked at the thousand and one things of his varied stock, that there must be a great deal of unwritten history connected with them. The acacia might tell him a romantic tale of the caravan; his quinine might tell him wondrous stories of Java and its volcanoes, or of snow-capped Andes; his sarsaparilla might paint the glories of a tropical forest; and his cod liver oil could possibly relate some thrilling adventures of the modern Vikings or Norsemen. His pharmaceuticals and finished products might continue the narrative, and, although the latter might lack that peculiar enchantment which distance gives, yet a glance at the influences which have shaped their course, and finally guided them to his

shelves, could not fail to be of interest to him.

To obtain an idea of the great magnitude and diversity of the business of pharmaceutical manufacturing, with its economy of labor and elaboration of product, there is perhaps no better plan than to pay a visit to the establishment of Frederick Stearns & Co., situated at Detroit, Michigan. Here can be seen in operation upon a large scale all the many processes which in a great degree go to make up the science of pharmacy; and here all the varied forms of medication which the profession of medicine can demand are turned out. This establishment, of which an illustration is given above, is one of the largest of its kind in the world. It is situated on 21st street, in the western part of the city, and occupies an entire square, with a frontage of 300 feet and a depth of 180 feet. As the building was constructed especially for the purpose for which it is used, its general arrangement is such as to afford the greatest convenience and economy in the storage, manufacture, handling and shipping of the various products manufactured. The building is three stories high, rectangular in shape, and encloses two open courts which give convenient access for teams to all the different departments of the establishment. These courts are reached by an arched entrance on the 21st street side, and it is through this that crude drug material from all parts of the earth enters the works, finally to emerge in the shape in which it appears upon the shelves of the druggist. It seems rather an anomalous condition in industrial affairs when we imagine what often occurs in the passage of drugs through this arched gateway. A load of Cascara Sagrada enters, and the wagon wheels touch those of another vehicle conveying a load of Cascara Aromatic just starting on its journey to the Pacific Coast. The eucalyptus of Australia could, if it were animate, exchange greetings with a more polished and educated portion of its family on its way back to its original home. The newly arrived coca from Bolivia might witness the departure of a consignment of some manufactured product bearing the same name, on its return journey to Cochabamba. Thus it is that there is a constant passing of crude products, coming from the most remote portions of the world to experience the mutations which the knowledge of man and

the skill of his machines can give them, and many of them emerge in their improved condition to be returned to the same people who originally furnished them.

To follow in detail the various manipulations which belong to the manufacture of medicinal preparations is an exceedingly interesting procedure, and where such are reduced to a perfect system, as is the case in the laboratory of Frederick Stearns & Co., the subject becomes all the more interesting. Commencing at the north building, or that portion of the works comprising the wing to the left in the illustration, there will be found upon the first or ground floor the department devoted to the manufacture of Stearns' (now well-known) Wine of Cod Liver Oil. Two large rooms upon this floor are devoted to this product, one containing five large extracting machines, large tanks fitted up with power agitators, each with a capacity of 120 gallons, and a mixing tank with a capacity of 1,000 gallons, with an attachment of air force pumps, etc., and other appliances for conveying the finished material to a storage room upon the next floor above. The other room is devoted to finishing this preparation, and here can be seen in operation automatic bottling machines, capping machines, and a force of thirty girls busily engaged in labeling, wrapping and boxing the goods. This product, which is now so deservedly popular with the medical profession, is a striking example of the readiness of the pharmacist to recognize the demand for improved methods of administering remedies of known value, and to make use of the most skillful methods in supplying that demand. The therapeutic virtues of cod liver oil are too well known to admit of any discussion of its value, but there have always been objections to its use, which became stronger as the pharmacist gradually showed that his skill was competent along other lines to make the rough way smooth in the matter of taking disagreeable medicines. There grew, therefore, an impatient demand that he rob the taking of cod liver oil of its greatest terror—its abominable taste—and many are the more or less futile schemes which have been employed to encompass this end. With the advance in knowledge of the properties of alkaloids, especially those of animal origin, and their therapeutic value, there began to dawn in the minds of advanced investigators an idea

that those of cod liver oil could be isolated and administered in that form. The credit for this idea belongs to two eminent French chemists, Messrs. Gautier and Mourgues, who gave to the combined medicinal principles of the oil the name "Morrhual." The agent employed in the manufacture of Stearns' Wine of Cod Liver Oil is identical with this, being known as Stearns' Extract of Cod Liver Oil, which extract is twenty-five times stronger in active principles and alkaloids than the plain oil itself. This extract, in combination with wine and peptonate of iron, furnishes a means of administering these important medicinal agents in a manner most agreeable to the patient, and a wealth of clinical reports from leading practitioners of the country indicate that it has achieved an enviable position in the confidence of the medical profession.

Quite appropriately the room adjoining this special department is devoted to another branch of manufacturing pharmacy which has had its growth from the demand for palatable medicines. Here are made the various elixirs, medicated wines, syrups, glycerols, etc. Although the work of this department is such that its success depends more upon the formulae and skill employed, yet the appliances and conveniences are of the best which ingenuity can suggest, and the popularity of the goods of this sort turned out is evidence of the care and skill employed in their manufacture. The production of perfumes is referred to by the firm as one of their "side lines," but the many admirers of Stearns' Fine Perfumes will be loath to regard them in anything but the light of products of great importance, and a glance through the department which adjoins those already referred to will convince the observer that "specialty" would be the better designation. The perfume department embraces a mixing room, freezing room, filling room, finishing room and large fire-proof vaults for the storage of the costly materials, such as musk, ambergris, oil rose, etc., which enter into the manufacture of perfumes. The mixing room contains several large machines for washing pomades, copper agitators, and machines for mixing the perfumes. That the perfumes manufactured by this firm possess those characteristics which should distinguish a fine article, such as fragrance in abundance without disagreeable "loudness," delicacy with sweetness, freedom from sharpness, with permanency and lasting qualities, is quite evident from the great demand which has arisen for them, and that there is a demand for them is further evidenced by the fact that their aggregate sales amount to over \$5,000,000 per annum.

Upon the second floor of the north building is found the Chemical Stock Department, and a dispensing or requisition department for the purpose of filling the requisitions of the differing manufacturing departments for the various drugs and chemicals used in the establishment. Adjoining this is the Analytical Department, in charge of Prof. Charles C. Sherrard, whose duties consist in examining all the materials used in manufacturing, and assaying samples of each lot of fluid extracts manufactured, before the goods are bottled and sent out from the establishment. The department for the manufacture of this firm's famous specialty, Cascara Aromatic, is also located upon this floor. This department has a capacity for turning

out 1,024 pounds of this preparation per day, and the fact that the force is kept busy is quite satisfactory evidence that Cascara Aromatic (Stearns') is in great demand. This particular preparation of cascara sagrada, in which none but two-year-old bark is employed, to obviate the griping qualities of the new bark, was first introduced by this firm in 1889, and such was its success that within two years after its advent the inevitable imitator came forward with his testimony that it was a good thing. But in spite of this the Stearns' preparation seems to be firmly established in the favor of the medical profession, and as the process of manufacture is one which was originated by and is reserved by the firm, it is safe to say that the original Cascara Aromatic will retain the field it has won for itself. It is upon this floor that is found the storage of the Wine of Cod Liver Oil previously referred to. It is quite well understood that this preparation enjoys a large sale, but one is hardly prepared for the sight of four long rows of one hundred and fifty gallons of the finished product. These tanks are always full, as fast as one is emptied it is immediately refilled, so that the stock on hand always aggregates at least 10,000 dozen, and the orders from the large jobbing trade are almost always for round five or ten-gross lots.

The third floor of the north building is devoted principally to storage purposes. From seventy-five to one hundred thousand pounds of cascara sagrada bark are always kept in stock, and the firm state that, so far as they are able to learn, they are the largest users of this bark in the world. Immense quantities of mandrake, sarsaparilla, etc., are also always in store, and on this floor is also found the large stock of glassware which an establishment of this magnitude is always obliged to have on hand. The value of this material always on hand ranges from \$5,000 to \$50,000. The eastern end of this floor is partitioned off so as to be practically isolated from the rest of the building, and is devoted to the manufacture of poison fly paper. It is provided with a cemented floor covered with absorbent material, upon which stand the drying racks for holding the paper after it is taken from the tank holding the solution with which the paper is impregnated. This department has a capacity for 50,000 sheets per day.

The first floor of the middle building is devoted to that important branch of pharmacy—the manufacture of fluid extracts. It is divided into three rooms. The first contains immense screw presses with two hundred tons pressure for thoroughly exhausting the drugs, and large vats and tanks where drugs undergo the macerating process. The second room contains the stills, evaporating pans, kettles, etc., and one especially large still for recovering alcohol. The third room is devoted to the process of percolation, and presents an imposing array of copper and stoneware percolators of from five to fifty gallons capacity. In connection with this department are the podophyllin works, located in a separate building in the court. Here are several large percolators of 150 gallons each, also drying closets, straining frames, drying racks, etc., used in making this important resin. The second floor of the middle building is devoted entirely to the manufacture of pills. In the pill cutting department is found a plant which consists, so the firm

states, of the only complete set of the Colton pill machines in America. This plant includes machinery for making the strips or pipes, as well as that for cutting them into pills. The pill mass is fed into a machine in small chunks about the size of one's thumb, which are carried by means of wide rubber bands running upon two cylinders, between the latter, and rolled into pipes of the required dimensions. These are collected in trays and fed a dozen at a time into the second machine, which cuts them. All that is necessary is to furnish the mass and the machines do the rest. A complete set of such machines with the aid of five girls easily does the work of 25 girls with the ordinary methods of pill making by hand. The capacity of this plant has been proven to be a half million 3-grain pills per day, and the saving in labor through its use is estimated at \$5,000 per annum. The adjoining pill massing room is fitted with a complete line of rollers, varying from 3 inches to 12 inches in diameter, and constructed of steel and porcelain, the latter being necessary for chemicals which would be damaged or altered by contact with metals. The gelatine coating room is supplied with a complete set of apparatus, the process used having been patented by the superintendent of the department, Mr. Allyn D. Stearns. This apparatus does away with the use of needles, using instead hollow tubes from which the air is exhausted and the pills held in place by atmospheric pressure during the process of dipping in the gelatine solution. Twenty girls are employed in this department. The gelatine-coated pills of F. Stearns & Co. are noted for their beauty of finish and were favored with a special award at the World's Fair. The sugar coating pill room is well equipped with ten large revolving copper pans and turn out a product beautifully finished and very soluble. The back building, forming the eastern side of the courts, has a carpenter and repair shop upon the ground floor, in which are made all the tables, shelving, etc., used upon the premises, and the force of carpenters is kept busy doing the general repair work of the establishment, fixing packing boxes, etc. The drug milling department also occupies two floors of this building, the machinery upon the first floor being used for powdering. Chaser mills are used for this purpose, each consisting of two large mill stones set upon edge and revolving upon an enclosed circular bed of the same material. They are enclosed in tight wooden boxes or houses, and as the material becomes reduced to an impalpable powder the greater part rises as dust and settles upon the space outside the enclosed stone bed and the walls of the houses. The second floor is equipped with machinery for grinding, and includes three disintegrators, turning at the rate of three thousand revolutions per minute, each having a grinding capacity of one ton per day of ordinary drugs. This department is also well supplied with root cutters, sifters, ball mills, grist mills, etc. The condition and poultry powder department is located immediately adjoining the milling department, the extent of the firm's business in this line being great enough to keep a large force employed in grinding, putting up, wrapping and packing this class of goods. One large room in this part of the building is devoted to the manufacture of compressed lozenges, tablets, tablet triturates, etc.,

four large power machines being employed on this class of work. The department for the manufacture of Effervescent Granular preparations is well fitted with complete apparatus in the shape of porcelain steam kettles, dry racks, etc.

The south building, or that portion of the main building shown upon the right in the illustration, is devoted to the printing office of the establishment and the "non-secret" medicine business. The former consists of a composing room where the typesetting for all the labels, wrappers and circulars used by the firm is done, as is also that for the neat little monthly publication issued by the firm and called "The New Idea." This sprightly journal occupies a unique position in pharmaceutical journalism, as it sails under its own colors as a professed organ of the business in which its publishers are engaged, but at the same time it has made many valuable contributions to the literature of pharmacy since its inception in 1879. The printing department is equipped with fifteen printing presses, four of them large cylinders, power paper cutters, folding machines, wire stitchers, ink grinders, in fact all the appliances necessary to turn out a bound book in the highest style of the art. The typographical excellence of the printed matter issued by this firm is especially noteworthy, and they take considerable pride in the fact that they can turn out as fine color work upon their own presses as they can obtain anywhere in this country. As examples are their own work upon calendars, blotters and similar tasty little works of art, which they send out to their customers and friends from time to time, all of them gems in their line, and their work upon their calendar for 1894, which consisted of a reproduction of a painting photographed in natural colors which, besides being the first work of the kind ever offered to the public, was of a character which an establishment devoted exclusively to such work might be proud to own. The label stock room adjoining the printing department is filled with pigeon-holed cases containing many thousand different kinds of labels, the total stock of these numbering several millions.

The ground floor contains the "grease" department, with its machinery for making ointments, suppositories, cosmetics, etc., and specially constructed centrifugal churns for the manufacture of emulsions. Upon this floor is also found the "non-secret" manufacturing department. This idea of furnishing domestic remedies of approved formulae, to take the place of the secret and high-priced "patent" medicines, was originated by this firm in 1876 and the proportions to which it has grown and the number of firms now similarly engaged, is good evidence that the plan which was christened "The New Idea" finds great favor with the retail drug trade. This department is equipped with mixing tanks, hydraulic filters, strainers and pumps for conveying liquids into the adjoining bottling department, where are found automatic filling machines, the ordinary gravity filters and special force pump filters for thick liquids, such as syrups, emulsions, etc. The bottle washing room is an interesting department even to those who have passed the period of apprenticeship. Automatic bottle washers (the invention of the firm), bottle dryers, etc., make up a plant for the rapid cleansing of bottles,

which for rapidity and effectiveness of work is hard to excel.

The first floor of the southern portion of the building fronting on Twenty-first street is devoted to the storage of filled stock; the non-secret finishing room, 120 by 30 feet in extent, in which forty girls are employed; and the packing and shipping department. In these latter rooms all the different items of a customer's order are assembled, and got ready for shipment. Sawdust is the packing mostly used, and is brought to the works in wagons and conveyed to huge bins on the third floor by means of blowers. As the packers arrange the different articles in the packing cases, a slide is opened at intervals as the packing progresses, and the saw dust allowed to slide down a chute and fill the spaces between the articles being packed. After being marked the packages are then ready for shipment, and the directions upon some of the cases show that their journey is to be a long one. Among the orders ready for shipment could be noticed the names of Scott & Co., Rangoon, Burmah; Sen & Co., Delhi, India; N. S. Fernando, Colombo, Ceylon; Newzealand Drug Co., Christchurch, N. Z.; Lennon & Co., Cape Town, S. A.; F. D. Shepard, M. D., Aintab, Turkey; Salvador Alsina, Barcelona, Spain; Artega Revenga & Co., Caracas, Ven.; Dr. C. Lopez Lascaro, Guayaquil, Ecuador, and many others in as equally remote corners of the earth. Upon the second floor of this section of the building is found the department with special machinery for the manufacture of cartons and knock-down boxes, the paper stock room, and the bindery, where the work of folding and stitching the various publications of the firm is done, mostly by machinery, only the gathering of the printed sheets being done by hand. The seidlitz powder room upon this floor contains new and ingenious machines devised by Stearns & Co., for weighing and measuring the powders. These machines work automatically, and insure the highest degree of accuracy in the powders which they deliver. This firm has always been favorably known for the high quality of the material used in their seidlitz powders, and for the attractive forms and original styles in which their goods in this line are put up, their latest attraction being a large envelope with the powders each in a small envelope, these latter being wrapped in waxed paper.

In another room a dozen girls are employed putting up Stearns' Instant Headache Cure. This preparation enjoys a remarkable sale, considering the fact that the formula is not secret, and not a dollar has been spent in advertising it to the general public. It is put up in cachets which are imported, but the work of making the preparation and the filling are done at Detroit. The foreign factory furnishing these cachets state that F. Stearns & Co. are the largest consumers of their goods in America, their orders sometimes exceeding a million cachets a month. This preparation is handled by all the prominent jobbers, and it has had great success in holding its own wherever introduced. An adjoining room, made dust tight, is used for the handling of powders such as tooth, insect, etc., and goods of a similar light character. The remaining departments upon this floor are a large room devoted to the packing, labeling and finishing of pills for shipment, and another room devoted to the

work of getting out agents' samples and keeping their traveling outfits supplied. Almost all the entire top floor, which is 220 by 30 feet, is devoted to the manufacture and storage of paper boxes. It is equipped with the most modern and improved machinery, employs fifty hands, and turns out every kind of box used in the institution except the folding cartons previously mentioned. Frederick Stearns & Co. have the reputation of putting out the handsomest packages of any house in their line of business and an inspection of the work done in this department seems to prove it.

The boilers and engine which furnish the motive power for this great establishment are in an isolated building located in one of the courts. This location affords a great protection against fire. Two boilers supply steam for the engine and for heating the buildings. In the engine room is located a dynamo which generates the electricity for lighting all those departments of the establishment where alcohol or other easily inflammable substances are used. The other departments are lighted by gas made on the premises by means of a Michigan gas machine, which supplies about 400 jets. As there are 300 electric lights in the building the firm may well claim to have one of the best lighted laboratories in the world. Adjoining the engine room is a well-equipped machine shop, where an experienced machinist is kept continually employed in making new appliances, or repairing old ones. Much of the machinery used by F. Stearns & Co. was made in this shop, such as their gelatine pill plant, centrifugal emulsifiers, seidlitz powder, bottle capping machinery, etc. Over the boiler room is an extensive dry room fitted with iron racks, blowers, etc., where all green drugs in bales are stored before being ground in the mill room, which is close at hand.

The foregoing is but a brief mention of the various departments which go to make up this great pharmaceutical establishment. The great engine furnishing the motive power to drive the machinery has been referred to, but the visitor in search of the real motive power should turn his attention to the offices where all the business of the firm is transacted. These are situated upon the first floor facing 21st street, and extend from the main (and only) entrance, near the middle of the building, to the north end, a distance of 180 feet. Owing to the fact that this space is divided up into fifteen offices, including those on the second floor, the effect is not so imposing as it would be were they all in one large room; but for retirement and quiet in the transaction of business the arrangement has decided advantages. Entering the front door, one comes into the reception office, where a girl is in attendance to wait upon the visitor and convey his message to the person whom he wishes to see. Adjoining this office is the city or telephone office, where all the city telephone business is done, and where telegraph messages are sent and received. In this room is a circulating library donated by the firm for the use of all its employes. The next office is that of the superintendent, Mr. L. H. Gardner. In here is found the formula department, from which every formula used in the laboratory must be obtained by proper requisition. Such a perfect system of checking is observed in this department that mistakes are almost, if not entirely, out

of the question. The General Office is the next in rotation, and is presided over by Mr. N. A. Tabor, who has charge of orders, collections and claims. Here the mail is opened and distributed, orders entered and priced, drafts sent out, letters copied, etc., etc. This office employs twenty persons, including three stenographers, and is an exceedingly busy place. Off from the main office is a large fire-proof vault, 10x30 feet in extent, in which are kept the account books, order books and safe. Next adjoining the main office is that of the vice-president and treasurer, Mr. F. C. McLaughlin, who, with his secretary, is pleasantly located. Mr. McLaughlin, in addition to looking after the finances of the firm, attends to the buying, which in itself is enough to keep any man busy the better part of his time. The next room is occupied by the assistant treasurer, Mr. W. I. L. Stearns, who, in addition to the duties of that position, has charge of the private formula work. Directly across the hallway is the office of the assistant superintendent, Mr. W. G. Rankin, and next in order is the book-keeper's office, where four experts keep the accounts only, all the other clerical work being done in the main office. Next comes the office of the secretary, Mr. Thomas Bennett, who is assisted by Mr. S. C. Stearns, assistant secretary, two clerks and a stenographer. Mr. Bennett has entire charge of the foreign business, which takes up the greater part of his time, although he also attends to the correspondence of inquiry, and makes quotations on goods. The next office in order is that of Wayland D. Stearns, assistant general manager, who has the assistance of four clerks and a stenographer. The last office on the ground floor is that of the president and general manager, Mr. F. K. Stearns. This is fitted up modestly, yet in good taste, and, being the most remote from the works, is quiet and retired. Returning to go upstairs, one passes through the letter file room, where are stored away the thousands of letters and orders received during a single year only. A stairway in this room leads up to the agents' reception room and office of Mr. D. M. Gray, manager of the travelling department. It is here that the "travelling boys," some fifty in number, meet and compare notes, do their correspondence, etc. Mr. Gray's only assistant is his stenographer. Adjoining Mr. Gray's office is that of Mr. M. R. Gatell, manager of the Spanish Department, who attends to all the correspondence, making out of orders, arranging for the printed matter for the same, invoicing, etc., and who, being a skillful typewriter himself, needs no assistant for such work. The last office to be mentioned is that of the Physicians' Department, in charge of Dr. W. B. Winn. Here is kept account of the work of the detail men and the general correspondence with physicians. Dr. Winn has two stenographers and a clerk.

The various departments of the laboratory number forty-eight, and all are under the direct supervision of registered graduate pharmacists, so that all the operations of manufacturing receive that careful attention which only a thorough knowledge of all the details of the science of pharmacy can give.

In addition to the Detroit laboratory, the firm has another establishment at Windsor, Canada, in charge of Mr. Irving H. Taylor. This branch has charge of the firm's trade in the Dominion, and is fully

equipped for the manufacture of everything in the pharmaceutical line. The New York office at No. 1 B Platt street, is in charge of Mr. N. T. Pease. The London, Eng., office at 25 Lime street, is in charge of Mr. W. A. Richardson, resident manager. The Australian business is looked after by Mr. R. H. Itoe, who has an office at 37 Pitt street, Sydney, N. S. W. The maintenance of these offices is necessary on account of the firm's extensive foreign trade, which they estimate at about one-fifth of their output. They enjoy the distinction of being the first American pharmaceutical manufacturing house to engage extensively in foreign trade, having commenced in South and Central America in 1882, and in Australia, India and South Africa in 1885; and their elegant publications in the languages of these foreign countries have been important factors in the development of this trade. In addition to the executive staff mentioned, the firm employs between four and five hundred persons, and has a force of fully fifty travelers, including detail men, who are kept busy the year round informing the medical and pharmaceutical world of the superiority of the firm's manufactures, calling especial attention to their specialties, the Wine of Cod Liver Oil, Cascara Aromatic, Haemoferrum (Blood Iron), their delicious Kola Cordial and Dike's Pepsin, and in this connection it is quite pertinent to state the first two mentioned each received an award at the World's Columbian Exposition, 1893, the total number of awards received by the firm being fifteen.

A reference to the personnel of the house of Stearns would be incomplete without a mention of its founder, Mr. Frederick Stearns, who, although a stockholder in the business, has had no official connection with the firm since his retirement, in 1857. Mr. Stearns, senior, came to Detroit in 1855, and engaged in the drug business, and his successful experience of over thirty years as retail and wholesale druggist, and finally as head of one of the largest manufacturing establishments in the country, is one which falls to the lot of but few men. Although he still retains great interest in the affairs of his chosen profession, his later labors have been mostly those of a citizen of the republic of letters. He has traveled extensively in foreign countries, and his knowledge of the history, customs and manners of some of these, especially China and Japan, has earned for him much favorable notice as a collector of curios and as a lecturer and writer upon the latter countries. The Stearns collection of Japanese and Korean art objects, numbering some sixteen thousand pieces, which was presented by him to the Detroit Museum of Art, has been pronounced the most carefully selected, typical and complete collection of its kind in this country.

WORLD'S FAIR PICTURES.

Later parts of the Michigan Central's World's Fair Portfolio fully justify the claim made upon the publication of the first number, that it was the best, the finest and the most artistic of popular publications on the White City.

Each part contains sixteen (16) large plates and is sold for only ten cents. If you haven't seen it, the nearest Michigan Central ticket agent will show it to you, or you can write to O. W. Ruggles, G. P. and T. Agent, Chicago.

PEANUT OIL.

As a result of the inquiry instituted by the State Department upon the peanut-oil industry in foreign countries, which was mentioned in the Era of February 15, the United States Consul at Frankfort, Germany, reports as follows:

"I have the honor to acknowledge the receipt of special instruction No. 127, dated February 5, directing me to submit a report concerning the manufacture in Germany of oil, oil cake, and meal from peanuts, and particularly the extent to which peanut meal is used for food in the German army and navy. In compliance with this instruction, I respectfully submit herewith a report, with which are included as exhibits samples of peanut meal, flour, and biscuits, as prepared by the most approved methods in this country. These samples are of essential value to the report.

The use of peanut products by the German army and navy has not yet passed the experimental stage. An elaborate series of trials was completed only a fortnight ago, and the results have been reported officially to the Minister of War.

Peanuts vary greatly in value according to the quantity, and still more the quality of oil which they contain. The finest and most valuable come from the valley of the Senegal, in western Africa, while the lowest grades come from Madras. The principal varieties are graded in the market according to richness in oil and general merit as follows (the percentages being based upon equal weights of shelled kernels in the condition for grinding): Senegal peanuts, 51 per cent; Congo peanuts, 49 per cent; East African peanuts, 49 per cent; American peanuts, 42 per cent; Bombay peanuts, 44 per cent; Madras peanuts, 43 per cent.

The duty on raw peanuts imported into Germany is \$4.70 per metric ton (2,240 pounds), and the duty on peanut oil is \$2.33 per 100 kilograms, equal to about 9 cents per gallon.

The ordinary peanut or "earth nut," is the seed vessel and seed of the *Arachis hypogaea*, and grows in several of the Southern States of the Union, in Brazil, the East India, and on the east and west coasts of Africa. In 1891 there were imported into Germany 15,762 tons of peanuts, a slight increase over imports of the preceding year. The receipts declined to 13,158 tons in 1892, but rose in 1893 to 20,573 tons, of which 25 tons were purchased in New York, 5 tons in Brazil, while 8,471 tons came from West Africa, 5,431 tons from East Africa, and 7,040 tons from British East India. This large supply of imported peanuts is used for the manufacture of oil, and is consumed by about twenty-seven factories which are located in various parts of Germany, some of the principal ones being at Hamburg, Mannheim, and at Heilbronn, in Wurtemberg.

At the oil mills the kernels are ground or crushed and submitted to three successive pressings, in which a force of about 250 atmospheres is employed. The first pressing expels about 40 per cent. of the oil, the second 4 per cent and the third pressing from 2 to 3 per cent of the remainder. Cold-pressed oil of the first pressing from African or the best American peanuts is used in Germany as salad oil and for various culinary purposes. It ranges in price (wholesale) from \$14.75 to \$25 per 100 kilograms (approximately from 56.7 cents to \$1 per gallon), which is far cheaper than any edible quality of olive

oil can be imported and sold in this country. The American peanut is larger, sweeter, and, when roasted, better flavored than any of the others, but its oil is of medium quality and ranks below the African, being worth in the present market \$15.47 per 100 kilograms, or 59 cents per gallon. Oil from the East Indian peanut ranges in value from 40 to 50 cents per gallon, and like the last pressing from African and American nuts, is not used directly for food, but is consumed in the manufacture of soap and for various other technical purposes, among which is included the "fattening" of oleomargarine.

The most important secondary product of peanut-oil manufacture is the oil cake or meal which remains after the oil has been, as far as practicable, extracted by pressure. This sells for from \$30 to \$33 per ton, and until within a year or two past has been used in Germany exclusively as food for cattle, sheep, and to some extent for horses, though it is said that it is too rich and heating for working animals, and except in the coldest weather, causes excessive perspiration unless fed in small quantities and mixed with grains. Under chemical analysis peanut-oil meal shows such extraordinary richness in nitrogenous elements that the German savants have seized upon it as an obvious source of cheap and highly concentrated material for human food, adaptable not only to army and navy rations, but of timely and important value to the peasant and industrial classes, which have suffered from a long and nearly exclusive diet of bread and potatoes, unmixed with a due proportion of nitrogenous animal food. This has led to a series of experiments which are still in progress, and to the invention by Dr. Nordlinger, a chemist at Bockenheilm, of a series of preparations from peanut meal which seem destined to play an important part in the future food economy of the German people. The problem was to convert a waste material—the secondary product of oil manufacture—into a palatable, nutritious, and wholesome form of human food, cheaper in cost than the same equivalents of nutrition could be supplied in any other form, and susceptible of simple and easy preparation by any cook of ordinary intelligence. How satisfactorily this result has been already attained is shown by the four samples which are submitted with this report, and which represent the principal forms in which oil cake from peanuts is prepared by the Rademann Food Product Factory, of this city, under the processes of Prof. Nordlinger. These are:

(1) Peanut grits (Erdnussgrütze).—The coarse meal dried, purified, bolted, and packed in paper-mache boxes containing one German pound each, which is sold at retail for 12 cents. In this form it is used for soups, cakes, and is cooked like a vegetable as pure.

(2) Peanut flour (Erdnussmehl).—Similar to the above except that the meal is ground and bolted like ordinary flour. Both these preparations give the following analysis: Water, 4.8 per cent; protein substances, 48.5 per cent; oil, 22 per cent, and carbo-hydrated elements, 17.9 per cent.

(3) Peanut biscuits.—Dry light, highly palatable biscuits, or "crackers," containing 1.85 per cent of water, 34.84 per cent of protein substances, 21.51 per cent of oil, 33.64 per cent of starch, 2.73 per cent of inorganic ash, and 5.34 per cent of various other nitrogenous elements."

DETROIT TOBACCO CO.

The above illustration shows the interior mechanism of the new Detroit Cash Register, the general appearance of which is shown on advertising page 23 in connection with the advertisement of the Detroit Tobacco Company. All the work of recording sales is done by an ingenious arrangement of wheels; it shows how many times the drawer has been opened for change during the day, and it is impossible to open and close the money drawer without registering. It registers any amount from 1 cent to \$20, and has a capacity of \$2,200 for each day's work before resetting to zero. The Detroit Tobacco Co., who call the attention of the drug trade to the machine, are a successful firm who have been in business in Detroit for a long time, and enjoy an enviable reputation for commercial integrity, and we believe they will faithfully perform anything they advertise to do. They offer one of these cash registers free with an order for 1,000 of any of their popular brands of cigars. They send 200 cigars for examination, to be returned if not satisfactory, and will send the remaining 800 with the register, if the cigars suit.

The Larimore Falls Medicine Co., Larimore Falls, Me., has been incorporated for the manufacture of Dr. Wortzel's Great German Liver and Kidney Cure."

THE NATIONAL DRUGGIST.

Our live contemporary, the National Druggist, of St. Louis, has shown its faith in advertising in general, but in the superior advantages of the Pharmaceutical Era in particular, by taking a full page in this issue. For many years the National Druggist has occupied a commanding position among pharmaceutical publications. Its editor, Dr. F. L. James, is well known in Europe and America for his learning and ability, and the stamp of his individuality upon its editorial pages has given to this journal a dignity and position excelled by none of its contemporaries. A few months ago Dr. James and Mr. H. R. Strong bought the National Druggist. Mr. Strong assumed the management, and the great improvement in the magazine itself, its extended circulation, its increased advertising patronage, give emphatic evidence of his alertness, energy and business ability. To both subscribers and advertisers we cheerfully commend the National Druggist.

A. L. REYNOLDS, Ottumwa, Ia.—I received the small Dose Book and Key to the U. S. P., and value them very highly. I find them quite accurate and so much handier than having to turn to the Pharmacopoeia when in doubt as to dose and so on. Could hardly get along without the Era.

BOOK REVIEWS.

UNITED STATES DISPENSARY.*—The seventeenth edition of this work is a veritable encyclopedia of pharmaceutical information brought down to date. The main reason for this revision was to bring it into conformity with the Pharmacopœia of 1890, and this seems to have been very satisfactorily accomplished. The new Pharmacopœia embodies some radical changes from its immediate predecessor, necessitating the preparation of entirely new copy throughout a large portion of the dispensary. In addition, there has been within the several years elapsing since the sixteenth edition of the dispensary such vast progress in matters pharmaceutical, so many discoveries of new remedies, such revision of processes of manufacture, such an addition to our fund of information on matters pharmaceutical that the editors have had placed before them a task of enormous magnitude in the gathering, compilation and selection of the proper material for publication.

Nearly 1,500 pages constitute the main body of the work, wherein are considered official and standard remedies in alphabetical order. The text is particularly complete, entering freely into the descriptions, constituents, chemical and medical properties, tests and doses, and methods of preparation. In presenting this variety of information the typographical excellencies of the work are apparent, and references to sources of information are numerous and distinct. The editors have seen fit to supplement the metric terms for weights and measures used in the Pharmacopœia by their equivalents in the apothecary's system, explaining in the preface that it is their belief that this step will conduce greatly to the interests of the readers of the work, who will in this way be able to see at a glance the equivalent of an unfamiliar term in one which is known and, thus, in a short time the new names will take a place among those common to everyday life. They approve of the metric system by saying that the whole numbers and rounded forms thereof must finally secure their exclusive adoption. The new chemical nomenclature of the Pharmacopœia has been closely followed, and in the botanical nomenclature wherever the official names are not wholly approved, the editors indulge in comment to the end that through free discussion the best results may be obtained.

Part 2 presents first the entire text of the National Formulary. Section 2 of Part 2 is devoted to drugs and medicines not official in either the United States of British Pharmacopœias but which, on account of their use in domestic or professional medicine, their toxic properties, their history, or the probability that they may prove in the near future remedies of power or valuable products, should receive notice in a work of this nature. The text of this portion of the book is presented, double columns to the page, and in smaller type than in part 1. Here are included the large number of synthetic preparations introduced within a

*The Dispensary of the United States of America. By H. C. Wood, M. D., J. L. D., Joseph P. Remington, Ph. M., F. C. S., and Samuel F. Sadler, Ph. D., F. C. S., seventeenth edition. Revised and rewritten, 1,500 pages. Royal octavo. Cloth, extra. \$7; sheep, \$8; with patent index, 50 cents additional. Philadelphia, J. B. Lippincott & Co., 715 Market st., 1894.

few years past and the drugs and preparations whose present importance have not seemed to warrant their inclusion among the list of official articles. Part 3 opens with a very complete exposition of the tests and processes of the Pharmacopœia, with many tables of convenience for the conversion of weights and measures, specific gravity, thermometric equivalents, formulas, and molecular weights, etc. Concluding, the index of nearly one hundred pages, in three columns to the page, closely set, is a most comprehensive and valuable feature, which is supplemented in the first portion of the work by a thirty-page index of diseases with the remedial finding employment in their treatment.

Where there is so much to commend, it is difficult to find aught to criticize, and we congratulate the compilers of the work and its publishers upon the notable contribution to the working library of pharmacy which they offer to the profession.

***ESSAYS IN HISTORICAL CHEMISTRY.**—This work is precisely what its title would indicate. It is a collection of essays or lectures delivered by the author at various times to audiences of differing types during the past eighteen or twenty years. Professor Thorpe's reputation as a speaker rests upon his possession of wide and thorough knowledge and a happy gift of expression. These essays, therefore, are of entrancing interest, and the chemical world will receive the book with hearty appreciation. The author claims for it no pretensions to be a historical treatise on chemistry, even of the times over which its narrative extend, but merely a recountal of the achievements of such investigators as Black, Dalton, Liebig, Hoffman and others, which ought to find notice and preservation in permanent form. Many of the sketches have before been seen in print, and were as a rule illustrated with experiments appropriate to the occasions. The lectures are arranged in historical sequence, so that, in fact, they constitute a real history of the development of the science of chemistry. There are but thirteen essays, devoted in their order to Robert Boyle, Joseph Priestley, Carl Wilhelm Scheele, Henry Cavendish, Antoine-Laurent Lavoisier; Priestley, Cavendish, Lavoisier and La Revolution Chimique (presidential address to the Chemical Section of the British Association for the Advancement of Science); Michael Faraday, Thomas Graham, Friedrich Woehler, Jean Baptiste Andre Dumas, Hermann Kopp, Dmitri Ivanowitch Mendeleeff, and a concluding chapter on the rise and development of synthetical chemistry.

TRICRESOL.—A purified mixture of the three isomers of cresol; soluble to extent of 2.5 per cent in water, forming a neutral solution. A 1 per cent aqueous solution is equal in disinfecting power to a 3 per cent aqueous phenol solution.

ARSENIC IN DISTILLED WATER.—Our English exchanges relate a narrow escape from arsenical poisoning in a board school where distilled water for a chemistry class was supplied in a jar which had previously contained arsenic.

*Essays in Historical Chemistry. By T. E. Thorpe, Ph. D., F.R.S., etc., Professor in the Royal College of Science, South Kensington, London. Cloth, \$2.50. MacMillan & Co., London and New York.

EDWIN H. NELSON.

Nelson, Baker & Co., Detroit, Mich.

Among the manufacturing interests of Detroit is one in the line of the drug trade which in a comparatively brief period of time has attained a position before the trade which is most creditable to its originators. We refer to the house of Nelson, Baker & Co., manufacturing pharmacists. They require no special introduction, as their reputation is well established with the pharmaceutical fraternity.

Mr. Edwin H. Nelson is the president and general manager of the company. He is a young man of much business sagacity, and to him is largely due the success of the house, through his faculty of making friends and particularly through his judgment in the selection of coworkers and subordinates. Mr. Nelson is a man of strong personal characteristics and knows the drug business from A to Izzard. He was born at Brighton, Ont., in 1856, where he received a good general education, and, finally, in 1878, graduated from the Ontario College of Pharmacy. He came to Detroit in answer to solicitations from a man well known to him, through this connection became conversant with every detail and manipulation of the business. He has likewise had extended experience as a traveling salesman, in which his success was marked. He is the possessor of exceptional executive ability and the faculty of so handling his forces as to achieve the best results.

The treasurer of the company is Mr. William S. Baker, who, too, is peculiarly fitted for connection with a business of this character. For fourteen years he traveled as a salesman for manufacturing pharmacy, encircling the globe in his journeyings, and he naturally knows what lines of goods are sought by the trade.

Medicine is represented in the house in the person of the secretary, Dr. J. J. Mulhern, who was selected on account of his professional knowledge in more closely identifying the practice of medicine with the manufacture of remedies. Dr. Mulhern is widely known to the medical profession through long editorial service and through professional practice.

The vice-president is Mr. J. M. Crombie, who is well qualified for his duties and diligent in interest and activity. Of the other stockholders mention should be made of Mr. R. S. Gilkeson, who acts as special traveling representative, and Mr. F. E. Merrifield, who looks after the firm's business in New York and Brooklyn. Also Mr. George Peck, one of Detroit's heavy capitalists and president of the Michigan Savings Bank, and finally, Dr. T. A. McGraw, connection with whose name is sufficient endorsement.

The house of Nelson, Baker & Co. is now in its fifth year. It has succeeded in building up a large and profitable business, consequent upon the manufacture of a reliable line of manufacturing articles of pharmaceuticals, a specialty being private formulas for patrons. Sales are made in all quarters of the globe. The house is represented on the road by twenty-five traveling salesmen. This company is particularly well equipped with modern laboratory facilities, and an efficient corps of officers and workmen for producing the best of pharmaceutical products.

PATENTS,

TRADE-MARKS AND DESIGNS.

From U. S. Patent Office Gazette.

PATENTS.

- 517,533—Process of Dyeing by the Aid of Paramididophenylamin.—Arthur Weinburg, Frankfurt-on-the-Main, Germany, assignor to Leopold Cassella & Co., same place.
- 517,473—Blue Dye.—Oscar Navst Vogel and Friedrich Reingruber, Elberfeld, Germany, assignors to the Farbenfabriken, vormals F. Bayer & Co., same place.
- 517,626—Process of Purifying Tannic Acid.—Bernard Reinius, Paterson, New Jersey.
- 517,861—Composition for Exterminating Canada Thistles.—Richard B. Hull, Milton Junction, Wis.
- 518,018—Corkscrew.—Edward Becker, Solingen, Germany.
- 518,161—Device for Administering Medicine.—William B. Pollard, Hot Springs, Ark.

Expired April 3, 1894.

- 189,149—Processes of Treating Wool-Oil or Grease to Obtain Glue or Gelatine.—H. Thanlow, Christiania, Norway.

Expired April 16, 1894.

- 189,538—Production of Coloring Matter From Aniline.—Justus Wolff, Wike, near Bradford, and Ralph Betley, Wigan, England.

TRADE MARKS.

- 24,322—Preparation for the Cure of Gonorrhoea.—Enoch D. Phillips, Bessemer, Ala. The word "Clip."
- 24,323—Pills.—Henry Robinson, New York, N. Y. A portrait of the registrant and his fac simile signature, "H. Robinson," and the name "Dr. Cheesman."
- 24,345—Chewing Gum.—Faultless Chemical Company, Baltimore, Md. The word "Bromo" enclosed in a circle having a diametrical bar.
- 24,346—Toilet Powders.—John R. Planten, Brooklyn, N. Y. The Chinese words "Meen Fun."
- 24,347—Soap, Perfume and Toilet Powder.—Henry Tetlow, Philadelphia, Pa. The words "Holly Blossom."
- 24,348—Syringes.—Arthur E. Cruickshank, San Francisco, Cal., and London, England. The word "Vonda."
- 24,349—Cod Liver Oil.—M. Calm & Bro., New York, N. Y. The word "Dulcol."
- 24,350—Eye Water.—Father Lebreton Eye Water Company, Indianapolis, Ind. The representation of a combined cross, arrow and heart.
- 24,351—Corn Remedy.—William S. Haswell, Denver, Colo. The word "Toe-Gum."
- 24,352—Chemical and Pharmaceutical Preparations. Ichthyol Gesellschaft, Cordes, Hermann & Co., Hamburg, Germany. The word "Anytin."
- 24,353—Chemical and Pharmaceutical Preparations.—Ichthyol Gesellschaft, Cordes, Hermann & Co., Hamburg, Germany. The word "Anytol."
- 24,354—Remedy for Asthma.—Joseph H. Guild, Rupert, Vt. The words "Green Mountain" used in connection with the words "Asthma Cure."
- 24,355—Remedy for Throat and Chest Diseases.—Gertrude E. Miller, Pawtucket, R. I. The word "Arabilline."
- 24,356—Remedies for Diseases of the Throat and Lungs, Liver, Blood, Kidneys and Nerves.—Geo. W. Pangle,

- Council Bluffs, Iowa. A portrait of the registrant and the words "Good Samaritan."
- 24,357—Medical Compound for the Cure of Neuralgic and Rheumatic Complaints.—Dahl & Co., Barmen, Germany. The words and abbreviation, "Quinaloegen-Dr. Vis."
- 24,359—Chewing Gum.—Faultless Chemical Company, Baltimore, Md. The representation of the upper portion of a woman's figure with the right hand extended upward toward the face and the forefinger of said hand resting upon the mouth, and accompanied by the words "Faultless Gums."
- 24,391—Toilet Liquids, Pomades, Powders, Caked Powders and Soaps.—John D. Rishell, Philadelphia, Pa. The words "Pale Rose."
- 24,392—Soap in Cakes or Bars.—The Geyserrite Soap Company, Denver, Colo. The word or symbol, "Geyserrite."
- 24,395—Essential Oils and Chemicals.—The Charles H. Phillips Chemical Company, New York, N. Y. A symbol on shield.
- 24,396—Preparation for Removing Hair.—Jacob Mellinger, Baltimore, Md. The word "Fomoraze."
- 24,397—Elixir.—C. Bailly & Cie, Paris, France. The words "Quina Laroche."
- 24,398—Hydrophosphate of Calcium Compound.—Abbott Loring, Boston, Mass.; New York, N. Y., and Chicago, Ill. The word and letter "Fat-Ten-U."
- 24,399—Medicinal Preparations in the Nature of Tonic Phosphates.—Giovanni Bruno, New York, N. Y. The word "Phosphoria."
- 24,400—Remedies for Constipation, Biliousness, Rheumatism and Neuralgia.—Prentiss Chemical and Manufacturing Company, San Francisco, Cal. The representation of a crown and an arm issuing from the crown and bearing in the hand a dagger, together with the name "Prentiss."
- 24,415—Mineral Waters.—Moritz Hirscher, Buda-Pesth, Austria, Hungary. The words "Franz Josef."
- 24,416—Medicinal Tonic Preparation.—Billings, Clapp & Co., Boston, Mass. The words "Bark and Iron" arbitrarily arranged on a descriptive label so that the words "Bark and Iron" extend crosswise of the printed words of the label.
- 24,417—Remedy for Coughs, Colds, Throat and Lung Affections.—Arthur F. Walker, St. Johnsbury, Vt. The word "Pulmorcure."
- 24,418—Chemical and Pharmaceutical Preparations.—Actien Gesellschaft Fur Anilin Fabrikation, Berlin, Germany. The word "Resorbin."
- 24,419—Lime for Disinfecting and White-washing Purposes.—William H. Phillips, Newark, N. J. The representation of a negro in standing posture, attired in trousers, short and hat.
- 24,421—Toilet Soap Paste.—Buzby & Bickley Co., Limited, Philadelphia, Pa. The word "Perslan."
- 24,422—Oil Soap for Manufacturing and Domestic Purposes.—Buzby & Bickley Company, Limited, Philadelphia, Pa. The word "Ruby."
- 24,445—Perfume for Toilet Uses in Liquids, Powders, Pastes and Soaps.—George E. Lorenz, Toledo, Ohio. The words "Wild Grape Blossom."
- 24,446—Shaving Soap.—The J. E. Williams Company, Glastonbury, Conn. The words "Swiss Violet."

- 24,464—The Gold Cure for Opium, Whiskey and Tobacco Habits and Nervous Diseases.—The Leslie E. Keeley Company, Dwight and Carbondale, Ill. The representation of a globe crossed by a belt, and the words "We Belt the World."
- 24,465—Remedy for Certain Named Diseases.—John W. Lundgren, Worcester, Mass. The word "Linnea."
- 24,466—Blood Purifier and Kidney and Liver Regulator.—Isalah E. Zimmerman, Paterson, N. J. The representation of a human eye, the capital letter "Z," the character "&" and the abbreviation "Co."
- 24,467—Remedy for Certain Named Diseases.—John Morrison McLeod, Goderich, Canada. A monogram of the letters "J. M. McL."
- 24,468—Medicine for the Cure of Neuralgia, Grip and Fever.—The Pheno-Bromate Chemical Co., Lebanon Springs, N. Y. The word "Pheno-Bromate."
- 24,469—Remedies for Catarrh, La Grippe and Diseases of the Throat and Lungs.—Leonia Mabee, Paris, Tex., and St. Louis, Mo. The word "Targarett."
- 24,470—Cough Drops.—Joshua F. Beane, Augusta, Me. The words "Aunt Rebecca's."
- 24,471—Liniments, Worm Powders and Elixirs for Diarrhoea.—Frank E. Carter and Cynthia S. Jones, Boston, Mass. The word "Relieva."
- 24,473—Castor Oil.—M. Calm & Bro., New York, N. Y. The word "Laxol."
- 24,474—Liniments.—Elijah F. Watkins, Palatin, W. Va. The representation of an outline of a human figure wearing a helmet and standing over a wingless dragon having its tail partly coiled about his right leg.
- 24,475—Insecticides.—Orlando H. Jadwin, New York, N. Y. The words "Fatal-Food."
- 24,476—Remedy for Chicken Cholera.—Edward M. Hawkins, Cuba, Mo. The letters "S" and "C" in the form of a monogram, followed by the letters "U. R. E."
- 24,496—Medicine for Diseases of the Bowels and Stomach.—Howard Woodcock, Brookfield, Wis. The words "Wonder Regulator."
- 24,497—Certain Named Medical Compounds.—Herbert L. Partridge, Lacrosse, Wis. The word "Safety," and the representation of a bicycle.
- 24,498—Medicinal Compound for the Prevention and Cure of Diptheria. A. W. De Jean, Minneapolis, Minn. The word "Ba-Lobell."
- 24,499—Medicated Distilled Water.—Kalish Pharmacy, New York. The words "Restorative Water" and the representation of a column set in the earth with water gushing therefrom.
- 24,506—Natural Mineral Water.—J. P. Forbes & Co., San Francisco and Chicago. The word "Castallan."

TANNATE OF STROPHANTHIN, employed as is the pure glucoside and administered in pill form, occurs as a whitish, amorphous powder, soluble in alcohol, containing 58.14 per cent of strophanthin.

H. E. MITTOCKS, Chenoa, Ill.—Today's mail brought me the second edition of the Era Dose Book and the Era Key to the U. S. P. Accept my thanks. I do not hesitate in saying that THE PHARMACEUTICAL ERA is the best drug journal published, and I could not get along without it.

THE MARKETS.

The fluctuations noted in this market report are those affecting goods in original packages and jobbing lots. A complete price list, showing quotations as made by jobbers to retailers, will be found upon another page under the head of "Prices Current."

New York, April 18, 1894.

The unfolding of fresh developments during the past fortnight has been rather slow and requires scarcely more than passing notice, the period having been comparatively uneventful, with little or nothing to disturb the general monotony which has prevailed for several weeks. Of course, there have been a number of fluctuations in values, but the final results do not indicate any radical changes, and the tone of the general market reflects a continued determination on the part of the majority of holders to patiently await the anticipated turn of affairs. Importers and dealers in round lots report continued inactivity, while jobbers are only moderately busy, but the limited orders received are sufficient, in the aggregate, to prevent any material accumulation of supplies, and, although the outlook is far from encouraging, there is yet ground for believing that the general volume of business will reach enlarged proportions in the near future. It is generally conceded that stocks of distributors are light in all localities, and the necessary replenishing would surely follow an improved demand from the consuming trade; but, with the latter perusing the hand to mouth policy, it is doubtful whether the former would anticipate future wants to any important extent, and transactions of magnitude are not likely to be numerous. The cautious methods governing operations since the recent period of depression have been productive of good results, inasmuch as collections are made with less difficulty than formerly, credits are examined more carefully, and financial affairs are consequently in a more satisfactory condition. Speculation no longer seems to cut any important figure in this department of trade, but its absence is not considered an unfavorable feature; on the contrary, many are inclined to the opinion that more confidence is felt when supply and demand, together with other natural causes, influence the various changes.

OPIMUM—Has continued to decline in price and the market is weak in tone, with the demand slow. The available stock has been increased by further large arrivals, and carefully prepared statistics show the receipts thus far this year to be fully 150 cases in excess of the entire importations of 1893. There is nothing in the general outlook encouraging to holders, and unless the proposed duty becomes an established fact, it is claimed that a further material shrinkage in values is probable. On the other hand, we hear that the present condition is merely the result of a well organized "bear movement" for the purpose of securing control of the bulk of the stock both here and abroad, and when that purpose is accomplished, a sharp reaction will follow. This theory is partly borne out by the fact that one or two of the large holders have declined to name quotations.

POWDERED OPIUM—Is also dull and weak, but the decline is not in proportion to the lower prices for the gum.

MORPHINE—The depressed condition of opium has influenced an easier tendency, and manufacturers have reduced prices 10 cents per oz. on all sized packages.

QUININE—Has recovered somewhat from the depression noted in the last report. An improved demand has absorbed a liberal portion of the surplus stock recently offering and values are firmer, but there are still sellers at $\frac{1}{2}$ to 2 cents less than the price named by manufacturers' agents, and the available supply is amply abundant to meet existing requirements of consumers. Rumors are again current that manufacturers are contemplating a further advance, and that such action is warranted by the steady improvement in bark, but counter-rumors state that no change will be made before September or October.

COD LIVER OIL—No important change has occurred in the market for this article either here or abroad, and with the exception of a few fair-sized parcels transferred from one dealer to another, the movement has been comparatively moderate. It is usually the case when sharp advances occur and extreme prices are reached that buyers operate cautiously, so it is not surprising that a quieter feeling should prevail in this market. The final result of all the fisheries for the current season is not yet known, but there are indications of a shortage, and when the figures are made public it is not unlikely that increased firmness will develop, particularly as the stock of several dealers is much lighter than usual.

ALCOHOL—The reduction in prices of grain previously noted has given the market a more settled appearance and consumers have operated with a greater degree of confidence. It is stated that the distributing company has made a new arrangement with the combination of producers whereby they will be better able to meet competition from outsiders. Wood is unchanged and a continued fair jobbing business is in progress.

QUICKSILVER—The larger dealers have again advanced prices, but small outside holders are shading the quotations from first hands.

BALSAM COPAIBA—Is moving freely into consuming channels, with Central American showing the larger volume of business, but the range of quotations is wide, owing to the variety of qualities offering. Para is in reduced supply in consequence of liberal purchases for export, but while values are firmer, former prices are yet acceptable.

BALSAM FIR—Is ruling easy under pressure to sell and lack of demand. The coming crop is expected to be unusually large, and bids are already being solicited by sellers in primary markets.

BALSAM PERU—Is held firmly at advanced prices, especially the better grades, the stock of which is concentrated in few hands, and only small parcels are offering.

BALSAM TOLU—Is in good demand for consumption, and values have a steady support.

ARNICA FLOWERS—Are meeting with a steady, fair consuming inquiry, but values are without quotable change.

AMERICAN SAFFRON—Continues active in a jobbing way, with the tone of the market strong, and still higher figures are probable in the near future.

ERGOT—Remains dull and neglected,

with values nominal and tending in buyers' favor.

SHORT BUCHU LEAVES—Show a decline of about 1 cent per lb on all varieties, resulting in a more active demand from consumers.

DAMIANA LEAVES—An increased demand has reduced the spot stock materially, and the recent decline in prices has been fully recovered, with indications favoring a further advance.

OIL LEMON—Has again declined and all brands are 5 to 10 cents per lb lower.

OIL PEPPERMINT—H. G. H. is higher under an improved demand, and the principal holder is quoting extreme prices. Tin oil is quiet and unchanged.

OIL LEMONGRASS—Is easier, with prices showing a decline of about 5 cents per lb.

JALAP—Continues weak and unsettled, with the stock in first hands unusually heavy. Dealers and importers are apart in their views and are competing with each other for the jobbing trade, which results in a general demoralization of the market.

CASCARA SAGRADA—Is strong and a shade higher, with an active inquiry for the better grades of oil.

CITRIC ACID—Has been reduced 1 cent per lb by the manufacturers, and prices from dealers are correspondingly lower.

CAMPFOPH—Easier markets abroad for crude and continued competition from the Japanese article have influenced American manufacturers to modify their views and a decline of 2 cents per lb is announced.

SPERMACEIN—Has met with an increased demand mainly for export, and with available stocks reduced, holders of block have advanced values $\frac{1}{4}$ to 1 cent per lb. Cakes are quiet and nominally steady.

CHICLE—Has ruled quiet and further business has been checked by a hardening of holders' views, the change in values showing an advance of about 1 cent per lb. The stock in first hands is large, and some claim that there is nothing to warrant the improvement.

OIL OF CUBEBS—Has declined about 10 cents per lb in sympathy with the recent reduction in prices of berries.

OIL OF SASSAFRAS—Is about 1 cent lower for natural and 2 for artificial.

OIL SPEARMINT—The better grades are available at about 25 cents per lb less than previous quotations.

OIL WINTERGREEN—Is 10 cents lower, without stimulating the demand to any important extent.

TONKA BEANS—The Angostura variety is held with considerable firmness, but a revision of prices for Para and Surinam show a reduction of 5 to 10 cents per lb, according to quality and quantity.

ARSENIC—All kinds are ruling firmer, with the stock of Saxony Red reduced to a minimum.

BLUE VITRIOL—Is ruling strong and a higher range of prices is generally expected by dealers.

CHLORATE OF POTASH—Is easier and unsettled, with stocks large and in excess of consumers' requirements.

CREAM TARTAR—Is firmer in tone, but manufacturers are yet quoting the old range of values.

SERPENTARIA ROOT—Is in better request and values are slightly higher, mainly owing to the fact that stocks at primary sources of supply are practically exhausted.

GEORGE F. H. MARKOE.

GEORGE FRANCIS HOLMES MARKOE is widely known personally, and through his professional and scientific labors his name has become familiar to a far greater circle. His name and face are familiar to pharmacists through his regular attendance upon pharmaceutical meetings, and particularly because of his long term of service in the Massachusetts College of Pharmacy.

Prof. Markoe is a true American, if the term be applied but to citizens of the United States, though his birthplace was Valparaiso, Chili, where he was born June 10, 1840. His ancestors were of Huguenot parentage, leaving home for conscience sake, and locating in the West Indies. His father died when the boy was but an infant, but his mother marrying again his early recollections are of his stepfather, a sea captain, who frequently took his family, including the boy, of course, in his voyages along the coast of South America. In 1850 young Markoe went to live with his grandparents at Salem, Mass., and here he gained an excellent education in the Phillips Grammar

School. He then entered a drug store, and, supplementing practice by ardent study, he gained a very thorough insight into pharmacy and its allied branches. He became an enthusiastic botanist, spending the early morning hours before the store opened in this study, which has been his pleasure through life. In 1861 he entered the employ of a well-known Boston chemist, gaining with him most valuable knowledge of manufacturing and analytical chemical work. In Boston he passed ten years in a drug store, three years as a partner, and in 1873 assumed charge of a store of his own in the suburb of Roxbury, which he still conducts.

Prof. Markoe has been connected with the Massachusetts College of Pharmacy for thirty years. For eighteen years he was its corresponding secretary, and since 1867 has occupied the chair of pharmacy, except for a period of a few years, when he served as Professor of Chemistry. Since 1892 he has been back in his old position as Professor of Theory and Practice of Pharmacy. In other branches of science he has always kept very close affiliations,

and has been elected honorary member in various scientific bodies. For six years he served Harvard Medical School as instructor in materia medica, and he has won appreciation as a botanist of high repute. He joined the A. P. A. in 1863, and in 1875 was made its president.

Prof. Markoe is one who enjoys to the fullest extent the pleasures of knowledge, never so happy as when gaining or imparting information. He is an entertaining and instructive speaker, either in lecture or afield on a botanizing or geologizing tramp. He occupies a beautiful home, where he can experiment to his heart's content. He has been twice married, and his lovely home is the centre of a choice social circle.

There are many, all who know him, of the graduates of the College of Pharmacy who hold Prof. Markoe in warm remembrance for his uniform kindness and courtesy, for his ready sympathy and assistance; this, too, added to a high respect for his professional attainments and appreciation of his work as teacher.

ESTABLISHED AT THE NEW YORK P. O. AS SECOND-CLASS MATTER.

ESTABLISHED 1887.

THE PHARMACEUTICAL ERA.

EDITORIAL.

BOTANY FOR PHARMACISTS.

A writer in this issue makes a strong plea for the study of botany by pharmacists, or, rather, he demonstrates very plainly that botany is indispensable in the equipment of the pharmacist. It is strange that there is necessity for such an argument or demonstration, but too many pharmacists are disposed to underrate the value of this branch of science and belittle its importance as bearing directly upon and closely related to pharmacy. Of pharmacy it is a vital part. Vegetable drugs cannot be known if one is ignorant of their botany. A knowledge of botany is necessary to an understanding of the printed descriptions of drugs. It often serves as the ultimate test of distinction between the true and the false. It serves as a standard of valuation in many instances. Familiarity with plant families and species is one of the best tools of the trade to the druggist. The study of botany, aside from its immediate value and application in professional labors, is a most fascinating pursuit and an excellent training for the mind and powers of observation.

THEODORE METCALF.

A long-time conspicuous figure in pharmaceutical circles has removed from life's activities. A pioneer in the drug business in America, Theodore Metcalf for nearly six decades went in and out among his business and professional brethren, building and sustaining a reputation for sterling worth and integrity, not confined to the great city he made his home, but which found recognition and whose influence was experienced wherever the genius of American pharmacy made itself felt. Mr. Metcalf was one of Nature's noblemen of signal qualities. With a record of good deeds, of charitable hospitality, liberality and business successes, his life affords an example worthy of imitation by all. A few words of eulogy and a brief recountal of his business career are presented on another page. Here we would express the drug trade's great sense of loss in the removal of one who has honored pharmacy and endeared himself to the entire business and professional fraternity of pharmacy by his consistent and noble life. His is the reward after a long life of activity, of "Well done, thou good and faithful servant."

VALUE OF ORGANIZATION.

What a united body of determined men can do is well illustrated in the history and successful achievements of the Louisville Botanical Club. What that society has accomplished may be accomplished by a united drug trade in any city. Association acquaints druggists with each other, and enables each to pave the way toward making a friend of his competitor in business. It is all very well to be independent, if one can afford to be, and talk about going it alone, but wait till some cloud appears on the horizon of trade, till the storm bursts, what then? The situation can be best understood only when felt. In an unorganized condition the druggist's action is individual, and the ends are individual. As an individual, what can one do toward checking trade abuses, or toward securing self-protection from the various combinations which affect the drug trade everywhere? Another point: Organization enables one to gain a broader knowledge of his business from timely discussions of his fellows, and considered from a social standpoint it gives him at least a few of the ordinary enjoyments of life. Organized effort can move on a question of duty or policy, with a unity of strength and definiteness of purpose which cannot be controverted. Are you a member of such an organization? If not, why not? It pays.

KEEP A SCRAP BOOK.

There is a vast amount of information afloat, ephemeral in its character, which if collected and arranged so as to be available would prove of great value to its possessor. Especially is this true of the material which comes in unstinted quantity to the hand of the pharmacist. Formulas, newspaper clippings, pamphlets, scraps of miscellaneous information, which, though of little value at the moment, may, if preserved, yield golden returns. It matters very little just what may be one's method of filing such information so long as there is system in it, and by system is understood such an arrangement in the compilation of material deemed worthy of preservation as will save time in reference and enable the compiler to locate the information at once. No scrap of information, formula, etc., is of value unless it can be found when wanted, and a well indexed "scrap book" or filing cabinet is worthy a place in the library of every professional and business man.

And this brings up another phase of the subject, that of filing current pharmaceutical journals. No scientific journal worthy the name is specially valuable for the present information it affords, but preserve the successive numbers of that journal, carefully keeping each volume (with its index) by itself and it becomes a source of profit, as well as pleasure, to its possessor. A carefully kept well indexed pharmaceutical journal puts into the hand of its owner scientific papers, formulas, hints on advertising, buying and selling and information upon a thousand and one subjects with which the pharmacist must some time or other become acquainted. Such a possession is, however, of no avail unless it be used by its possessor. It is valuable only as it is made valuable, and we would urge upon

every clerk beginning the drug business and every pharmacist who has grown gray in its pursuit, if he has not already done so, to make a beginning now. Collect all bits of information having a distinctive bearing upon your business and work, take pains to carefully file and index them, supplement this by filing and indexing your journals, and in a few years a working library of indispensable value and utility will be yours. On another page of this issue is a practical paper upon this subject which is worthy the consideration of every reader.

"MOVING-DAY" NUMBER.

We may be pardoned for a feeling of gratification at the reception accorded the May 1 Era, and may not be charged with egotism because we publish elsewhere in this issue a few of the many kind words and compliments of our friends. A friend, we all know, is the frankest and severest of critics, and that so much of flattering nature is spoken by our friends is surely proof that we have reason to feel flattered. We are not entirely satisfied with the "Moving-Day" number; we see places where it could have been improved, but we are assured that its deficiencies will be overlooked in virtue of its excellencies. That it was prepared under exceptional circumstances, in the general confusion of moving, with some members of the working staff at one end of the line, the rest at the other, lacking unity of action so necessary to quick and satisfactory results, rendered it necessary to surmount unusual obstacles, and he who knows what are the ordinary annoyances and difficulties of journalistic work will appreciate our feeling of satisfaction at having achieved, under adverse circumstances, a result which elicits so high a degree of commendation as has been accorded this issue.

We thank our friends for their praise, finding in it not alone a recognition of past or present deeds, but an incentive to farther a most earnest effort to merit their continued approval.

Further, we would say a word of recognition and thanks for the cordial, whole-souled welcome which has greeted all connected with this journal upon removal to New York. This kindly welcome, and the encouragement of speech and deed, are an earnest of what will, we are sure, be extended the Era in its new home and widen its field of labor.

NOSTRUMS WHICH CAUSE AND FOSTER DRUG HABITS.

Frequently there appear in print brief accounts of the disastrous results following the incautious or ignorant use of patent medicines containing toxic ingredients. But these notices never attract the attention they deserve from their significance. In the newspaper they form but a very small fragment of the day's offering of news, and are often so written that they are practically valueless to the general reader because of the reporter's inability to write intelligently on matters where some little knowledge of medicine and chemistry is necessary. In pharmaceutical and medical journals such reports find more recognition, but nothing comes of it. These journals do not go to the

class of readers who should be warned against the dangerous nature of some of the nostrums on the market. The very people who should know there is poison in the preparation do not know it, and the result of this ignorance is brought home to but few immediately affected by the illness or death of the victim. There should be some way of regulating the sale of articles which, ignorantly employed, may cause such harmful results. Movements for legislation in this direction have always been defeated by the manufacturers, who, in their greed for gain, are willing to hazard a life. These remarks do not apply to all, even to but a small minority, but this minority is a dangerous factor. As it now is, the maker of a cocaine catarrh cure, or morphine cough syrup, is at fullest liberty to kill or cure. In our State pharmacy laws patent medicines are specially exempted from all restrictions. They may consist of what you will. They may be sold or peddled as you wish. If a patent (proprietary) medicine poses as a medicine, why should it not be treated as a medicine, its administration restricted to properly qualified persons.

But it is not the report of a death caused by a secret nostrum that is the text for these remarks. We want to speak a word of warning concerning that class of concoctions which produces results worse than death the preparations which cause and support mind and body destroying drug habits. Here are tonics (non-alcoholic), liquor cures (non-alcoholic) containing as much alcohol as a strong wine or a whisky; the catarrh cure, containing a large percentage of cocaine; the opium habit cure, which contains a potent quantity of morphine; the cough syrups, loaded with opium, and many others of the same general character. The alcohol cure and the opium cure but seat the habits more strongly upon their victims. The catarrh cure and the cough medicine, or soothing syrup, cause the habit itself. The cocaine and morphine habits are debasing and destroying, and the manufacturer who for paltry gain would subject the purchaser to the risk of physical, mental and moral debasement should be summarily dealt with by law. If no law exists covering this crime, for vilest crime it is, he should be driven from the community.

Pharmacists cannot analyze and do not know the composition of every nostrum on their shelves, but when a medicine is exposed as containing a poison in disguise, dangerous in general and indiscriminate use, it is his duty to boycott it and expose its dangerous character. If our State pharmaceutical associations want to effect some real good for the profession and the people, let them stop wrangling over the prices of patent medicines and do something toward prohibiting the manufacture of the vicious ones. Make the pharmacy, poison and liquor laws apply to them, and then see that the laws are enforced.

SUBSTITUTION.

Recent developments concerning certain practices in the retail drug trade afford ground for expressions of regret that they should obtain in any degree, and particu-

larly to the extent it seems they do. We refer especially to substitution, in its most offensive and reprehensible form, and it is surprising that so many supposedly reputable druggists are found practicing it. Not long ago it was shown that St. Louis and Chicago druggists, when the proprietary article Listerine was called for, in more than half the cases would dispense some substitute, without any attempt to inform the customer that the imitation was given. For example's sake, the proprietors of the preparation made it very warm for some of the substitutes, and others promised over their signatures to sell no more. The condition of affairs prevailing in the cities named was found existent in many others, the extent of substitution being proven far greater than had been thought possible. Manufacturers of other proprietaries have been pursuing like investigations, with the same results, and we understand that offenders are to be brought to a full realization of their responsibility. There is a large class of proprietary medicines which are particularly subject to the attack of the substitutor. Not the ordinary, popular patent medicine, sold only in package form, but those which are exploited principally to the physician, and directed in prescriptions, being used by the dispenser in portions from the original container. Here is offered abundant chance for substituting an imitation for the genuine, Listerine, Antikamnia and many others are examples of this class. The substitutes vary wonderfully in physical and chemical characteristics, in some instances being such palpable frauds that sight alone will detect the imposture.

A few words to druggists avert substitution. There are two forms of substitution, one thoroughly reputable, honest and professional, the other a fraud and dishonest. The honorable variety is where the druggist, with no deception, no false representations, with the consent of physician or customer, brings into play his own professional knowledge and skill in opposition to the article called for. But, observe, there must be no deceit in this matter. It is perfectly legitimate to try to sell your own preparation, provided it be understood by the customer that it is yours. But the substitution complained of is not of this kind. It is dishonest and disreputable in every respect. The customer or patient has the right to get what he believes he is getting, and the druggist defrauds him if he doesn't supply it when he pretends to. An excuse frequently advanced for substitution is that physicians prescribe every new preparation called to their notice. They specify a certain make, when the druggist may have in stock his own or some other equally efficacious. A single prescription may be all that is received for that particular make, and the remainder is a dead loss. Much sympathy is felt for the druggist in this unpleasant predicament, but strict honesty should lead him to procure the goods ordered or refuse to put up the prescription. The only incentive to substitution is the desire for greater profit, but a business built up from dishonest practices is not a stable one. The arguments in favor of substitution are fallacious, based upon unsound premises. To those

who at times may feel tempted to replace the directed article by another, we would say, don't. Loss of immediate gain is amply compensated by ultimate success and a character for strictest probity in professional dealings.

Substitution, besides being dishonest, is a dangerous practice. The exact composition of a proprietary article is seldom known, and to replace it with a guess-mixture is a risky business. The substitution of cheap and inferior drugs for the pure and genuine is equally reprehensible.

We would not sermonize, and our views on this matter are, we believe, in sympathy with those of all conscientious pharmacists, but we would speak a word of warning to those whom nothing but a good fright will turn to better ways. Several producing chemists and pharmacists have become tired of the practices of the substitutors, and propose to bring them up with a round turn, and have inaugurated a searching inquiry in all the trade centres of the country. While we know of no concerted action, the investigation will be most thorough. If friendly, cautious and considerate treatment do not avail, counsel has been retained to prosecute vigorously those who refuse more amiable methods. The manufacturers are right in this determination, and have the approval of the better class of pharmacists. Whatever be the nature of the proprietary article (good or bad) the druggist who secretly substitutes is guilty of theft. The infringement of trademark rights must not be overlooked. This is a serious legal offense, the penalty for which is of a heavily unpleasant character. We encourage the supplying of popular demand by medicines of your own compounding, every manner of inducing the physicians to employ your preparations rather than the proprietaries and semi-proprietaries, so long as this is all done openly and above board, but have no sympathy for the dishonest substitutor, and would see him get his deserts.

VALUE OF VACCINATION.

The Royal Commission on Vaccination, in a recent (but long delayed) report to the British Parliament, details the results of an investigation which is of particularly pertinent interest at this time, when medical scientists are making the most extended and thorough study of the subject of vaccination which has ever been accorded it. The Royal Commission were directed to inquire and report as to

(1) The effect of vaccination in reducing the prevalence of and mortality from small-pox.

(2) What means, other than vaccination, can be used for diminishing the prevalence of small-pox; and how far such means could be relied on in place of vaccination.

(3) The objections made to vaccination on the ground of injurious effects alleged to result therefrom, and the nature and extent of any injurious effects which do, in fact, so result.

(4) Whether any, and, if so, what, means should be adopted for preventing or lessening the ill effects, if any, resulting from vaccination; and whether, and, if so, by what means, vaccination by ani-

mal vaccine should be further facilitated as a part of public vaccination.

(5) Whether any alterations should be made in the arrangements and proceedings for securing the performance of vaccination, and in particular with respect to prosecutions for non-compliance with the law.

The Commission, in accordance with time-honored English custom, traces the history of small-pox and allied diseases, as well as processes of inoculation, back to times almost prehistoric, but so far as concerns practical results from the investigation into matters as they now stand there is little but contradictory and conflicting evidence presented. Among the testimony is that of Dr. Crookshank, Professor of Comparative Pathology and Bacteriology at King's College, who believes vaccination affords but transient protection from small-pox. Though not the absolute rule, he thinks an attack of small-pox is a preventive of another, instances to the contrary being but variations of the rule. Regarding vaccination, he would leave that question to the discretion of the individual, with liberty to take the advice of his medical adviser. He says: "Believing, as I do, that the stocks of vaccine lymph obtained from cow-pox, horse-pox, sheep-pox, cattle plague, and even attenuated variolæ-vaccine, produce, if any, a very transient effect, I should leave it to the individual to weigh on the one hand the advantages (if they exist) of 'vaccination,' and on the other, the chances of infection with small-pox and the disadvantages and risks of 'vaccination.' A system of universal protective inoculation of healthy individuals as a means of warding off communicable diseases of man and animals has, in my opinion, had its day, but inoculation of individuals who are unfortunately the subjects of such diseases as rabies, tuberculosis, tetanus, is a new field of inquiry full of promise. I maintain that the State should protect the people from small-pox by a stamping out system and by the encouragement of sanitary reforms, and not by any system of protective inoculation."

Dr. George Cordwint, Deputy Coroner for West Somerset, is a witness whose experience of vaccination and small-pox extends over a period of fifty years. He does not believe in the protective power afforded by vaccination; but, in view of the fact that the system does not accept two diseases at the same time, he is of opinion that while the disturbance set up by vaccination lasts the system is proof against an attack of small-pox. This witness states that he has probably seen at least three hundred cases of small-pox occurring after vaccination, but has never met with one case of small-pox revisiting a person who has once suffered from the disease. Regarding injurious effects from vaccination his impression is that eczema in children becomes much more inveterate and that constitutional disturbances are very frequently occasioned.

The testimony of many other witnesses was virtually of the same nature. While declining to state that vaccination is or is not certainly protective, all agreed that at the present day the chance of any per-

son being infected with small-pox is infinitesimally small when notification and isolation are conscientiously carried out. Regarding compulsory vaccination it was pointed out that at best any regulations could be but imperfectly carried out. There are many unalterably opposed to the principle of vaccination, and to make martyrs of them through prosecutions would seem injudicious, and the opinion was expressed that there would be more vaccination if compulsion were abolished. One gentleman, speaking of prosecutions, said:

"I have always thought that when we try to enforce one of the ever-changing opinions of medical men we touch upon the liberty of the subject and the rights of human nature. I find that a number of parents are fined because they are convinced that vaccination is useless and injurious. I ask what is the character of those parents? Are they idle? Are they dissolute? Are they drunken? Are they careless of the welfare of their children? The answer is emphatically No. They are thoughtful, they are industrious; they are sober; they are men who look to the reason of things and who decline to be driven into any course of conduct which they do not rationally approve."

American physicians are, we believe, more generally believers in vaccination against small-pox, and our boards of health or other authorized officials look closely after the vaccination of the people. The Royal Commission's inquiries have resulted in little we did not know before, but the report is well worth consideration by those who are apt to hastily conclude for or against a proposition or measure. The conclusion that compulsory vaccination is most injudicious seems a good one, but the testimony on the several other lines of investigations leaves them still undecided. It will be impossible to make all the people, even a considerable proportion, believe that vaccination is not a preventive of small-pox.

LABORATORY NOTES.

By F. J. Wulling.

ANTISEPTIC SOLUTION.—The following formula used in the St. Louis Hospital in Paris (and which has been published in several of the foreign journals in '93) yields a solution which meets all the demands upon an antiseptic solution: Borax 11, boric acid 5, salicylic acid 5, and saturated solution of thymol (aqueous) 1.00 parts. Certain physicians here like the solution so well that they have a gallon of it made at a time for office use, and besides prescribe it quite frequently.

ANTISEPTIC POWDER.—An antiseptic powder used in the same hospital is composed of: Iodoform 100, benzoin 100, powdered cinchona 100, magnesium carbonate 100, and oil eucalyptus 12 parts. A few physicians prefer this to iodol or aristol.

MAGENDIE'S SOLUTION.—A Magendie's solution, made by dissolving the morphine sulphate in boiling distilled water containing one minim of carbolic acid in an ounce, filtering while hot, and again raising to the boiling point, will be found to keep very well. Physicians indorse the use of the carbolic acid.

PODOPHYLLUM RESIN.—In applying the U. S. P. tests to a sample of resin of podophyllum, the resin was found to be soluble in alcohol to the extent of only about 50 per cent. Of ten samples tested subsequently, 7 were found to meet the requirements of the U. S. P., the other 3 having been far from pure. They contained from 30 to 60 per cent of matter insoluble in alcohol, or in the fixed alkali hydroxides. The insoluble portion resembled very closely when dried exhausted podophyllum root. Gravil and Sage reported similar observations in 1893. (Pharm. Laborat. Col. Pharmacy U. Minn.)

SOFTENING COATED PILLS WHICH HAVE BECOME HARD.—Sugar and gelatin coated pills when kept for some time often become so hard that they will not dissolve in the stomach. They may be prevented from becoming hard or their freshness easily restored by attaching to the lower end of the cork of the bottle in which they are kept a small piece of sponge by means of a double-headed tack, and slightly moistening the piece of sponge. The sponge must not be too wet, otherwise the pills will become soft and adhere. There are very few pills to which the moisture would be injurious. In the writer's laboratory all lines of pills were kept fresh in this manner by carefully moistening the sponges every two or three weeks. The physicians in the neighborhood who were advised of this appreciated it, as was evidenced by their increased patronage.

EXPLOSIVE MIXTURE.—In the compounding of the following prescription:

Potassium chlorate 1 dram.
Tannic acid ½ dram.
Honey of rose 2 fl. ounces.
Fluid extract conium 15 drops.
Water, enough to make, 4 fl. ounces.
Mix and use as a gargle.

the compounder ignorantly or carelessly added the potassium chlorate, which was in form of rather large crystals, to the tannin in a mortar, and rubbed the two together for reader solution. Of course the two chemicals exploded, and with some violence, too, but fortunately the explosion did no harm. There is hardly any excuse for pharmacists who claim to be competent, to triturate potassium chlorate with other bodies, especially if the chlorate is to be dissolved. In some pharmacies the chlorate is kept in form of a saturated solution for just the purposes indicated by this gargle. Tannic acid and alum are prescribed more frequently, but some physicians prefer the chlorate with tannin, and the prescription in question is not an uncommon one. In this case the prescriber, too, had taken the trouble which not many physicians take, to add M. S. A., probably knowing that two of its ingredients would explode under favorable conditions.

It is a peculiar fact that a very small proportion of dispensers employ heat when admissible in facilitating solution. A salt, especially one which is not very rapidly soluble, as f. i. potassium chlorate, is always more readily obtained in solution by gently heating with the solvent in a Florence flask over a Bunsen burner, than by triturating in a mortar and adding the cold solvent.

HOW SHALL YOUNG MEN BE EDUCATED IN APPLIED CHEMISTRY?

By Peter T. Austen, Ph. D., F. C. S., Professor of Chemistry in the Brooklyn Polytechnic Institute.

There have of late appeared so many articles on the training of chemists* that it is with some hesitation I respond to the request of the editor of *The Era* for my views on this subject, because I feel that I may not have much to add to what has already been so well said by others. But as one who for a number of years has been preparing young men for active work in chemistry, and as one who has also been closely connected in various capacities with numerous manufacturing establishments, I may be able to emphasize some of the points already made and perhaps also suggest others which my experience may lead me to consider worthy of attention.

Chemistry is probably the most fundamental of all sciences, since it concerns itself directly with the study of the composition and changes in identity of matter. Hence it is not possible to predict what path the chemical student will pursue when he becomes independent and able to choose for himself, or what opportunities he may grasp if they are presented to him. Sooner or later every manufacturer calls for chemical knowledge, because in every manufacture the steps are more or less chemical changes, and the composition of the articles handled must be known. In the past this was not appreciated, but at present it is rapidly becoming recognized, and, indeed, in branches of manufacturing which are far from appearing chemical to the ordinary observer. A moment's reflection will, however, enable the educated reader to understand that manufacturing is but a series of material changes. Many of these may be mere changes of state, physical changes, effected by mechanical appliances, but even in these the composition of the substances may play an important part, and, at best, no clean-cut division between physical and chemical phenomena is possible.

The day of the ignorant man, of the rule-of-thumb man, of the so-called "practical man," has closed. Such men must needs be non-progressive. They can carry out what they have been taught, but they cannot originate, neither do they seem to be able to learn anything after a certain time. They are also apt to be as overbearing and disagreeable as they are ignorant and inefficient. The men who are now eagerly sought by large manufacturing concerns are those who are as highly educated as the complicated machinery of education can produce. Who can bring into action the greatest concentration of human knowledge concerning the particular sub-

jects at which they are put to work, and who can devise new methods, invent new processes, obtain new products and discover new facts? Who, so to speak, can think chemically and speak mechanically, and yet without all must be of the highest moral character, honest to a fault, and able to acquire the art of business, cultivating that element of tact which enables a man to control others and yet hold them as friends, and last, but not least, that disposition of mind which causes a man to seek his reward in the character of his work rather than in personal glory; whose happiness depends on the success of his work, on tangible results, rather than in applause or in mere learning, versatility, self-approbation, or any other of the effervescent phenomena which some lads exhibit to the men who are toiling wearily, and often none too competently, to carry on large industries, on the maintenance and development of which depend the subsistence of thousands, and who are seeking far more eagerly than is generally supposed for real scientific assistance. Such young men make the interests of their employers their own, and, glad as they may be to get their sip of the sweet, are not afraid to take the bitter without a grimace when it comes, as it always will, sooner or later, and yet without have the independence to resist in a frank and manly way any treatment, open or covert, which may savor of injustice or oppression. The strength and power of such men are never underestimated or unappreciated by business men, say what one will about the soullessness of large corporations or the heartlessness of mercantile business, for the maintenance and development of a large business call for educated brains at the head of each and every department, and no business can afford to lose brains that have been educated in its employ and which are actively working to advance its interests.

I have dwelt on this subject rather fully, because I wish to make it clear that the young chemist is liable to be an indeterminate quantity. He may enter an analytical laboratory and he may stay there all his life, every day making analyses; he may rise to own it; he may occupy himself with the processes of manufacturing and leave the mechanical working out to others or do it himself; he may step out into the works and superintend the processes, improve them, invent new ones, get up new products, and what not; he may rise to be superintendent of the whole works; if he has the peculiar ability he may go on the road and sell the goods, and as he knows all there is to be known about the articles he handles and those handled by others, he makes a salesman par excellence; understanding better than any one else the facts and reasons involved in the manufacture, and knowing all that there is to be known about the articles, he may be called to take charge of an agency or may be put to study the market to size up rivals; he may be made a director, or, for the matter of that, may rise to be president of the company; he may in time start a manufacture of his own; he may study law and become a distinguished patent expert; he may teach; he may become a successful farmer; he may become the chemical adviser of manufacturers, whose interests are not of such a chemical nature that

they can afford to employ the whole time of a chemist, but whose problems are none the less difficult, and hence require the assistance of a skilled, learned and experienced chemist. I might still prolong this list and yet know not when to stop nor depart from the facts, for of all of these cases, and more besides, I know from actual acquaintance.

It might be inferred from the above that man for all of them. In the strict sense this is true, but a course of study is not since the future of a chemical student is out a course of study that should fit a so uncertain, it would be impossible to lay intended to do more than to ground a student thoroughly in the principles and practice of the science in such a way and to such an extent that he may be able to take up any application of the science he may choose and follow it up by independent study and experimentation. Education bears a relation to a young man that is somewhat akin to that between the powder and the gun. We may charge him with facts as we do a gun with powder, we may show him how to get more, how to hold the gun, how to aim, but he must provide the gun, the ball and the cap. He may have all these and still not be able to hit the mark; he may have a big charge of powder, but a small ball; or his gun may knock him down by its recoil, or go off at the wrong time, or perhaps at the wrong end; or perhaps he has all but the cap, and another must provide it, and that is the saddest case of all. But, fortunately, experience proves that the average young man, who is properly and well educated, and who applies himself faithfully to his work, does not fail, but advances steadily.

It would not be courteous for me to discuss or criticize the various chemical courses of our leading educational institutions, but I may indicate the kind and nature of a course in chemistry which, so far as my experience indicates, will educate men who are best able to fill the demands made by this country; and I might add here that in some respects this country calls for somewhat different courses of study than those of Germany, one cause, among others, being the wide difference which exists between the school education of Germany and the United States.

The student must be thoroughly practiced in English. This may appear an unnecessary statement, but any one who has to deal with young men knows how frequently they are deficient in the ability to write and speak English well, or even to spell correctly. I do not wish to decry other studies, nor to involve myself in a discussion of the value of a classical education, but I do wish to emphasize most strongly the necessity for a thorough education in our own language. I know of but one way to accomplish this, and that is by long and continual practice. Not only should the essays of the student be corrected, but his daily writing, analytical reports, lecture notes, etc., should be corrected not only as to facts and accuracy, but in spelling and style as well. The ability to speak easily, clearly, briefly, forcibly, with good articulation, and to the point, not only to another, but before an audience, should be most assiduously practiced.

The ability to read German is absolutely necessary to the chemist. Most of our chemical literature is in German; indeed, most of the progress in chemical science is now in Germany. To learn to read a language is far easier than to learn to speak it, for in the written language most of the difficulties are already overcome. To read, one has but to learn the idiomatic differences between the language and English, and become familiar with the vocabulary. The idiomatic differences are not so numerous as to offer great difficulties. They are all in print before us, and, in the case of German, a small grammar, intended only for assistance in translation, with unceasing use of the dictionary, in a surprisingly short time enables the average student to read scientific German with facility, and opens to him the immense field of German scientific literature. To learn to speak and write German with any degree of correctness is a much greater task. The construction in a foreign language is always difficult, and requires great study and practice to accomplish much. While the chemical student may learn to write and speak German if he has the time to devote to it, the education in slight reading of scientific German is absolutely necessary, and is not difficult. Unless he has this ability he can hardly hope to become an independent chemical student or worker. French is not so absolutely necessary as German, but still of great importance. It is an easy language to learn to read, and the chemical student should make himself an adept at slight reading of it.

It would extend this article beyond its legitimate limits if I should attempt to discuss all the studies of a chemical course; suffice it to say that a thorough grounding in history, the elements of law, political economy, mathematics, metaphysics, logic, ethics and literature should be effected. The specialist is not made by picking out a few studies, but by concentrating as he advances; he advances from the general to the particular. The minds of the great specialists are like burning glasses, which collect a great amount of light and heat and focus them on a given point. The development of a scientific education should be like the building of a pyramid, which rises from a broad and ample foundation to an apex, from which an immense field of observation is commanded.

It is needless to say that a most thorough study should be made of physics, and especially of electricity, which every day is finding new applications in chemistry, and offers tempting fields for research to the chemist, and for technical applications as well.* Heat, on account of its vital importance in chemical changes, should receive particular attention.

With this introduction, let me consider the course in chemical instruction which I consider best adapted to develop independent young chemists.

In many institutions of learning, the instruction in chemistry is too much confined to analysis. Many young men are

graduated who, while fair analysts, do not seem to be capable of anything else. They are not familiar with experimental chemistry, or with manipulations, apparatus and methods not used in analysis; they are unable to prepare pure substances, and their knowledge of the mechanical methods of handling substances on a large scale amounts to practically nothing. Such men are naturally handicapped when entering a works, for methods of manufacturing do not resemble methods of analysis, and the difficulties which assail one on all sides are quite different from those met in analytical work. But in the study of experimental chemistry and in the preparation of pure substances the student at once comes in touch with the manufacturer in a way that one trained only in analytical chemistry ever can.

The course in chemistry should begin, therefore, in the laboratory, and with a thorough and elaborate drill in experimental chemistry. The principal elements and their compounds, properties and chemical conduct should be studied experimentally. The knowledge thus gained is invaluable. Indeed, such a course of study should be a part of any education, for a man cannot now be considered educated who is not familiar with the properties and behavior of matter. Much of the success of any man, and I might say, also, much of his happiness, will depend on his mastery over matter, and his ability to combat it when it becomes inimical to him. (Only a knowledge of chemistry and physics (physical science) acquired by personally conducted experiments can give him this. No amount of reading books, or even listening to lectures or witnessing experiments made by others, can give him the real knowledge, and the full appreciation of the things about him and their influence upon his welfare. Such actual and practical knowledge puts under a man's control a great power, which he can utilize for his own good and safety. Failure, distress and poverty are too often not merely synonymous with ignorance, but with ignorance of physical science. If a man does not master the things about him, they may easily master him.)

During the course in experimental chemistry there should be given a thorough lecture course in chemistry, illustrated elaborately with experiments, and accompanied with continual quizzing on the lectures, and all experiments should be sketched and described, and these notebooks should be frequently criticised by the instructor. After experimental chemistry is completed a course in blowpipe analysis should be given, after which should follow qualitative analysis, and then quantitative analysis. Aside from its scientific side, quantitative analysis requires a large amount of practice in order to develop a skillful and exact manipulation. While some students are quicker than others, there is no short cut to accuracy in this subject. In teaching quantitative analysis, care should be taken to keep abreast of the times as to methods. The instructor should be in touch with the laboratories of large works and take advantage of their methods or improve them. Men working on only a few forms of analysis, as in the case of steel, fertilizers, etc., evolve methods

which are amazingly rapid, yet are also accurate. There is no particular call for secrecy in this matter, and any instructor can acquire them. As a rule it is to the interest of manufacturers to have men educated in methods which have been adopted in the trade. It is, however, not uncommon to find methods of analysis taught in colleges which are antiquated, and could not be used in practice. Along with quantitative analysis, assaying and also mineralogy should be taught.

Toward the end of the instruction in quantitative analysis instruction should be given in the preparation of pure substances. The importance of this branch of the chemist's education cannot be overestimated. Not only should the purity of the preparation be called for, but its yield must be determined and reported, and the side products and wastes should be examined. The results at first obtained are usually humiliating to the student and disappointing to the instructor, but as the manipulation of the embryonic manufacturer increases results soon begin to appear which encourage and incite to renewed efforts. No chemist can hope to become a successful investigator, either in pure or applied chemistry, who is not skillful in the preparation of pure substances. The element of practicality soon begins to show itself as the student gets increasing yields without deterioration of purity.

During the course a carefully considered set of lectures should be delivered on technical chemistry, and special attention should be devoted to the relationship which exists between manufactures. A well-stocked technical college should be at the use of the students, and visits to representative manufactures should be made. A course of instruction should also be given in what is now termed "Chemical Engineering." This is a difficult subject to teach, and but few in this country are really fitted to undertake it. There appear to be great possibilities in classification in it, and a good opportunity for a good text book.* The various operations of manufacturing chemistry should be considered in detail, and grouped so as to be as independent as possible of particular substances, but rather appear as related to groups of substances of allied properties. Thus, in precipitation, solution, evaporation, stirring, heating and filtration, the various mechanical devices should be grouped and their adaptations to substances of allied properties explained.

The steam plant, pumps, vacuum and pressure apparatus should be lucidly described, so that the initial types and their manifold variations and adaptations may be understood. In this course of instruction, however, the inclination should be toward the adaptation of mechanics to chemical treatment rather than toward mechanical engineering. One reason for this is that it may easily make the course too long to fit in our educational institutions, and another is that the technical chemist can always count on the assistance of mechanical engineers for minor details and adjustments in any works of magnitude with which he is connected. Almost all the mechanical devices for handling chem-

*Hoyer's Mechanische Technologie is the only one of note.

*Note—Note the sudden development of the idea of electrical power in works, doing away with long steam lines, shafts, belting, etc., and reducing the coal consumption in some cases one-quarter to one-third, and the end is not yet.

ical substances on a large scale will be found on study to consist of a simple principle which has been modified to adapt it to the properties of the particular article. The experienced instructor is, therefore, able to treat the subject of chemical engineering with some degree of pedagogical success, and ground his students in the principles, yet still indicate many possible variations, adaptations, and evolutions for which the nature of the substance to be handled or the exigencies of manufacturing may vary. Thus a stirrer, consisting of an upright shaft provided with flat wings attached at right angles, and resting in a vat, is a simple mechanical device; but depending on the specific gravity, the viscosity, the temperature, the composition, etc., of the liquid to be stirred, many modifications will call for study. Thus the wings may be set at a bevel; secondary immovable or movable wings may be attached, the shape of the vat may be varied, the stirrer may run on a seat, or it may be hung free; it may be lifted out or not; it may be of wood or metal, or both; its motion may be simple or compound. It is evident, however, that a study of stirring machinery will leave a much clearer idea in the student's mind, and enable him to make a better choice of stirring machinery when called on to draw up specifications which include this form of mechanical treatment than if he had studied stirrers only as he met them in the various branches of manufacturing. In this latter method of study, which is the usual one, no clear, systematic or coordinated knowledge of stirrers as a class of mechanical devices is obtained, nor is any exact knowledge obtained of the modifications of a mechanical type to adapt it or develop it to suit varying conditions. Without this clear insight into the matter, the student is not well able to evolve new forms of stirrers himself, and hence is unable to attain the most perfect relation between the substances and their mechanical treatment under the particular conditions of the works. This always tells against him in the long run. He will have to depend largely on the army of salesmen who pursue him unceasingly, each of whom is positive that his device surpasses all others, but who is rarely willing to allow a trial of his apparatus, least of all on new articles. In this way he does not always get the best appliance, but that of the most skillful and adroit salesman. Again, so separately and exclusively are manufactures frequently carried on that devices used by one manufacturer, and which are entirely unknown to a manufacturer of articles of an entirely different nature, might be of great value to the latter, since his products, although entirely different, still possess properties which in some points call for almost the same mechanical treatment. In this case, again, the study of the mechanical device as a principle, and its modifications to adapt it to different conditions, is manifestly of great value to the young technical chemist. He is not only able to secure that adaptation which best suits his case, but, understanding clearly the relation between the adaptation and the principle, he is in a position to evolve or

invent himself an adaptation better than any other.

The above is true for most of the mechanical devices used in chemical manufacturing. For instance, in the case of boilers, the young technologist may fairly go insane when besieged by boiler agents, and, as a rule, has very little idea what he really needs. He may put in a boiler capable of quick firing and high pressure, when neither are of much importance to him, and when a heavy draught of steam rather than power is what he wants. A study of boilers and their different types with a view to the various demands made upon them in chemical manufacturing aside from maintenance of power will enable him to choose what is best adapted to his particular wants. The course in chemical engineering is best preceded by a course in mechanics, but not so full a one as is given in a course in mechanical engineering.

I have dilated on this branch of the education of chemists because I have not only had to educate young chemists, but to employ them in manufacturing. The gaps in their education which might be referred to inexperience by the man of business are not so easily overlooked by one who is also an instructor, for much of this ignorance, which, I might add, may cost the employer an amount as great or greater than the cost of the young man's education, could have been overcome during his education. Even such a matter as wooden vats is a constant source of vexation to the young chemist. Given a certain volume of liquid to handle, shall the vats be made tall and narrow, or low and wide? Shall there be a few large ones or several smaller ones? How much space shall be allowed under them? How near together shall they be? What accidents are to be provided against? There are certain principles underlying these simple matters which an experienced technical chemist can easily impart to his students and vexatious errors and serious losses consequently may be avoided by them.

The practice in the preparation of pure substances makes an admirable introduction to practice in the use of typical forms of technical apparatus on a small scale, and any time spent on this will be valuable indeed to the student, no matter whether he intends to devote himself to applied or pure chemistry. Practice in the use of miniature technical apparatus is, however, a branch of work that is best taken up as post-graduate. During the last years a great progress has been made in applying technical apparatus to laboratory work, and many of these forms of apparatus are as attractive and exciting to chemical workers as bits of transparent carbon crystals are to our betters. Each new catalogue from Germany puts one into a fever. Until a chemical course has rooms provided with these miniature imitations of technical apparatus it can hardly be called a course in chemical engineering, any more than a course in mechanical engineering could be so called if lathes, planes, drills, etc., were not provided for the use of students. Let me draw attention to some of the details of this department of technical chemistry. The vats of manufacturing are represented by wash tubs,

headless barrels, agate ironware and stoneware. Short pieces of lumber enable us to elevate them in tiers or in any other relation. Brass and copper pipe with rubber hose connections and copper wire bindings lead the liquids where we wish. A steam pipe supplies dry steam throughout the whole laboratory. The floor is bricked, inclined and channeled. It will stand heat or liquids. A kit of ordinary tools is at hand, saws, plane, grindstone, etc., and also a small forge. Shafting is handy over all, and is run by electric motors. Electric power wires can be had anywhere, and thus power can be used independent of shafting. Small bronze pumps driven by independent motors can be placed where they may be needed. A plentiful supply of several way cocks is on hand, and among the miniature pieces of technical apparatus are steam kettles, filter presses, pressure digesters, provided with stirrers, open evaporators, filter trays, distillation and column apparatus, centrifugals and gas blast furnaces, large and small balances and scales, and gas compressors. Vacuum and pressure cocks are in convenient places for attachment. I might go on with the list, but this will be enough to indicate what the department should be. Students may work alone, or in groups, in case of more complicated operations. It is needless to dilate on the value to the student of the work done in this department.

The chemical course should include a most thorough drill, not only in stoichiometry, the mathematics of chemistry, but also in mensural calculations. The volumes of tubs, vats, barrels, pans and what not must be readily calculable by the technologist. The more familiar a man is with higher mathematics, the better; no time spent on it can be lost, but dexterity in arithmetic and in simple and compound proportions is of great importance, although I fear it is often overlooked or underrated in our chemical courses. Dexterity in calculating volumes and weights of substances into gallons and pounds is called for all the time. Hence this must not be overlooked when teaching the metric system, useful as the latter is. I have known young men who have been well educated, but who have been much perplexed at the calculation of problems requiring more familiarity with an engineer's handbook than great erudition, and which are constantly recurring in chemical practice; as, for instance, how many inches deep must a cone-shaped kettle with a round bottom be filled to contain a given number of pounds of a certain liquid of a certain specific gravity.

Throughout the course a thorough drill in draughting should be given, and especially in free-hand sketching. The ability to draw will be invaluable to the technical chemist. Especially is it important to be able to illustrate his ideas by rapid sketches, for these save endless trouble with the mechanics with whom he has to deal.

Some instruction should also be given in the rudiments of building and strength of materials, particularly as related to factory buildings.

There are some other subjects in which young technical chemists are inclined to be woefully deficient, but which are capable of being included in the chemical

course, and even if not taught as fully as they might be, ought to be explained to the student sufficiently to enable him to go on with the subjects himself, and also to know something about their literature. I allude to the business side of applied chemistry, including double-entry bookkeeping, computations of cost of materials and manufacturing costs, distribution of costs, estimation of profits, charging off for wear and tear, rating, organization, nature, characteristics and management of labor, factory organization, emergencies, and the common principles of business and patent law.

It will always be of great advantage to the student to spend a year or two post-graduate and devote his time to higher chemical study undistracted by other studies. During this time he should carry on under competent instruction some purely scientific original investigation, and not only acquaint himself with the methods of research, but also become familiar with the ways of reading on chemical subjects, the indexes and keys to chemical literature, the great journals, and the other details of chemical literature. In carrying on an original investigation, it would be, perhaps, more to the benefit of the student if he were also practiced in producing known substances by new methods. Much of our original investigation, especially that of youthful savants, consists in making new substances by well-known methods. These new substances are valuable in many ways in scientific classification, and are dear to their discoverers, but the other line of work is fully as valuable to the student, viz., finding new ways to make known substances. When experimenting in both forms of procedure he is more likely to be successful in achieving what does not often fall to the lot of the student to do, i. e., make new substances by new methods. In manufacturing, new processes are as important as new products; hence the young investigator should be practiced in both these kinds of work. It must never be forgotten that in technical chemistry the demonstration of chemical facts is made practical on a large scale with little loss and at the lowest cost possible. It is evident, I think, from this that the study of pure chemistry and the education in purely scientific research, by which I mean the ability to discover new chemical facts, must not be overlooked or slighted, else the technical chemist may not have material to work on and may come to resemble a hen that sits on glass eggs.

In the above it has not been my attempt to describe in detail a complete chemical course, but only to indicate what appear to be some of the more important subjects of such a curriculum, that the student may be guided to some extent in his choice of a course. As in all other matters in this life, the element of individuality enters most vitally into education, and the student will do well to choose men rather than institutions, as is the custom in Germany. The most important element in the student's life is personal contact with powerful and highly educated men, who incite him to work, enthuse him, and develop in him the ability to think for himself and originate, to use knowledge to produce new knowledge. In the intense excitement which accom-

panies original work the acquisition of knowledge becomes mere play, and students soon learn how to ransack libraries and mine their own information. In actual life men do not read and study to prepare for recitations or examinations, but to assist them in the production of new ideas, or new facts; i. e., new knowledge. Knowledge plays the part of a fertilizer to the active, growing, producing mind. Any other relation is liable to produce mere pedants, men who are filled with knowledge, like water-soaked sponges, and who emit it, like sponges, in the same condition in which it was absorbed. A good encyclopaedia is worth tons of this deliquescent humanity.

THE PRESERVATION OF CLIPPINGS.

By Marcus Benjamin, Ph. D., F. C. S.

In presenting so ample a subject to the readers of *The Pharmaceutical Era* it seems proper to apologize for two things—the imperfection of the scheme and the personal references to the reasons of its existence. In regard to the former, by way of explanation, it may be said that the scheme is a development, and, as nothing that comes from the human mind is without imperfections, it is therefore open to criticism. To explain the personal element is perhaps more difficult, but I think it is best, in attempting the description of that which has received favorable comment from many sources, to make reference to the reasons that brought it into existence.

Nearly sixteen years ago, at the beginning of my professional career, I found myself the fortunate, as I then thought, recipient of a great number of technical journals containing information on scientific subjects. They seemed far too valuable to destroy, and yet it was impossible to keep them all. The files were incomplete, and, moreover, as they were received in consideration of certain advertisements, they were liable to be discontinued at any moment.

Each one contained something of value. To keep them all was out of the question, and so I began to clip them. On every clipping, however, I was careful to put the name of the journal, usually abbreviated as "E. & M. J.," for *Engineering and Mining Journal* (there were only three pharmaceutical journals published in the United States at that time), together with the exact date of issue and the volume and page. This I found very important, for in quoting from a clipping I could at once give a foot note showing its exact locality; for instance: "See *Scientific American*, vol. 57, p. 39, July 16, 1887."

Let me digress in order to emphasize the value of exact references. Most persons refuse to accept statements unless you give them some authority for the fact. An amusing illustration of this kind occurred to me recently. A well-known publisher asked: "What degrees has Professor Prescott of the School of Pharmacy of the University of Michigan?" I promptly replied "M. D. and Ph. D." Unwilling to accept the offhand statement, he persisted with a "Where do you get your facts from?" "You will find a sketch of his career in the *Scientific American Supplement* for August 22, 1891," was the answer.

Later in the day his secretary said to me: "You were right about Professor Prescott's degrees. How did you know?" My response was to the point. "I wrote the article myself." In the course of nearly ten years of cyclopaedia and dictionary work many instances have occurred in which disputed facts have been settled by reference to clippings, which would have been absolutely worthless as authority unless accompanied by the very important indication of source, with date. There is another phase of it. A clipping from a Detroit paper would carry more weight concerning a disputed point of an event in the career of Governor Bagley, for instance, than would a cutting from the *Memphis Avalanche* or the *Worcester Spy*.

To return to the clippings. At first I preserved them in an envelope, and soon had several envelopes full. Then I secured several hundred sheets of note paper and pasted the articles in them. But being of an economical turn of mind, I made the blunder, which, even now, I sometimes find was a fatal one, of putting more than one item on a single sheet. Under no circumstance must more than one item ever be pasted on a single sheet. In any collection there will soon accumulate a mass of miscellaneous material, and the tendency will be to place it together. Thus I have one heading for recipes, under which, before long, my glues, cements, blackings, etc., were all mixed up. I had not time to undo what was done, but at once I laid down the rule of pasting only one item on a sheet of paper.

On the back of each sheet I write two things: First, the subject; second, the title of the clipping. Thus, under the general title of nitrogen, I have items about the nitrogen oxides and the nitrogen acids; consequently, I find my sheets read, as for instance:

"Nitrogen—Nitrogen and Electricity" (being a clipping from the *Boston Journal of Chemistry* for January, 1877), and "Nitrogen—preparation of nitric oxide," being a clipping from the *Scientific American* for May 24, 1879. These sheets are all alphabetized under the second title, except as they refer to special subjects. That is to say, I try to keep the items having direct reference to nitrogen as an element together, those having reference to nitric acid together, and so on. In such a matter the personal judgment of the individual must be followed, and in this feature lies the great imperfection of any system. I have separate places for hydrogen, nitrogen and oxygen, but items on liquefaction of gases are sent to gases. This is purely arbitrary, but I see no other way to advise. Again, the subject of sewer gas came into prominence, and for a time I filed the items under gas, but the package grew too bulky, and so I made a new one for sewer gas and sent it to S. It is necessary to exercise arbitrary and special judgment in such matters. I group my metallic mixtures under the general head of alloy, and there are the clippings from brass to type metal, but if I should (as I frequently do) find any one kind of alloy, as brass, for instance, growing too bulky, it would at once be given an independent heading. Alkaloids form another group, but I have

a separate heading for opium alkaloids and one for quinine. The reasons are obvious. Cosmetics, under which formulas and notes on hair dyes and face preparations are kept, as well as disinfectants, are necessary groups. It would be impossible to give separate places to the many items otherwise, which, it must be remembered, are all alphabetically arranged, each one on a separate sheet of paper.

At first I used note-size paper, and had sheets cut for me in lots of 500. These I place in folders of heavy brown paper. A separate folder is devoted to each subject, on the outside of which is written the general title. Thus, in the letter G, I find my titles run as follows: Gallium; gas, illuminating; gas, liquefaction of; gases; gems, diamonds; gas, amber, rubies, etc.; glass, glue, glycerine, gold and gums. These folders are made a little larger than two of the note sheets, and are folded in the centre. In this way they are made to hold all of the single sheets. For each letter of the alphabet, I have two black cards of thick pasteboard, and between these I place the individual packages. The covers are held over the packages by rubber bands, but as these break and soon wear out, I would recommend in their place a bandage made of cloth tapering to points, where a piece of narrow ribbon or braid is sewed on for use in tying. This bandage system is used by Professor Edward S. Morse of Salem, Mass., for holding pamphlets, and is the best thing for this purpose that I have ever seen.* Between the rubber band and the cover I have an envelope on which is written a list of the titles of the packages contained between the boards, so that at a glance the subjects may be seen. This I use as a receptacle for loose items that for the moment I have not time to paste up. Also at the end of each letter there is a folder marked miscellaneous, in which are placed items that, as yet, have no regular folder for themselves.

Such is the scheme that I have followed for many years with considerable advantage to myself. Of course it has disadvantages, but it has served me well and profitably. If I were to begin such a collection again, a desirable modification, it seems to me, would be to use a thin brown paper on which to paste the clippings, taking care, however, to have a paper not too thin to write on. Also, I should have the paper cut the same size as an octavo pamphlet, so that such work might be included in the folders. Envelopes may be substituted for folders, but they tear, grow unwieldy and the flaps have a tendency to stick out. They are not nearly so neat as folders.

A final word as to the application of such a system. It goes without saying that much time is spent in gathering clippings, and there are many who claim that

*Note.—In the Scientific American of August 1, 1887, I have described Professor Morse's invention as follows: "His latest invention is a pamphlet jacket, consisting of a broad band, which, by means of a tape and hook attached, secures a set of pamphlets in a compact bundle that may be easily undone, and attached to the band is a card on which to inscribe the contents."

it does not pay. My own experience is (being a young man when the collection was begun), that handling the clippings in pasting them up impressed the subjects on my mind, thereby proving of great value to me. The collection distinctly led to my advancement, because I became known as one to whom application could be made for information. Although unwillingly, under any circumstances to loan the clippings, still exceptions were sometimes necessary, and in three instances very important matters were settled by a study of the material that I gathered. One instance may be suggested, for I think, I may safely say, that my friend, Mr. H. Y. Castner, who consulted them freely when he perfected his process for making sodium, leading to cheaper aluminum, found some items that were of the utmost value to him in securing his patent. At all events when his process was purchased in England he sent me a valuable expression of his appreciation in the way of a small block of stock. Another excellent illustration is to the point. A well-known journal offered a prize for the best essay on a selected subject. From the collection of clippings I was at once able to give a resume of everything of importance that had been published within the ten years immediately preceding. The prize was awarded to my essay. Incidentally, I may perhaps at this place be permitted to refer to an incident in that connection with which the editor of *The Era* is familiar. In certain quarters the essay met with adverse criticism, and, curiously enough, facts were discredited in such a way as to show an ignorance of the subject on the part of the reviewer. The very items objected to were from articles by authorities high in science, but whose opinions had been condensed into a single statement. Another illustration. A report on a technical matter was called for by the Government, and its preparation placed in my hands. There was not time enough to study the subject up. An evening's work on my notes, and the treatment was mapped out. Certain data were then gathered from trade sources, and the report was sent to Washington. It received high praise, and gained for me a pleasant recognition in scientific circles as an authority on certain subjects.

In many other ways have the clippings proved of value to me, and in conclusion let me say that I have never made it a point to collect papers or items, but simply have gathered in what has proved to be the wheat from the many papers and periodicals that have come to me.

QUININE PILLS.—A method of preparation which is advocated by Kurstner, directs the intimate mixing of 10 grams quinine sulphate with 2 grams each of citric acid, powdered gum and sugar of milk, then massing with syrup. The cut pills are rolled in starch, then in talc.

DEATH RATE OF CITIES.—The greatest death rate in the world is said to be that of Rheims, France, where the proportion is 23.62 per one thousand each year. Minneapolis, Minn., reports the fewest deaths, only 9.6 per thousand.

[Written for *The Era*.]

BOTANY FOR THE PHARMACIST.

By Frederick C. Newcombe, B. S., Ph. D., Assistant Professor of Botany, at present in charge of botany at University of Michigan.

The object of this paper is not to indicate what pleasure the pharmacist, in common with other people, may derive from the study of plants, nor to point out how the comprehension of biological principles will have a vastly important philosophical bearing on his habits of thought and his attitude in the study of men, but to show (1) why the pharmacist, as a pharmacist, needs botany, (2) how much of it he needs, and (3) how he can obtain it.

In the commercial world there are three groups of positions which the pharmacist occupies, or is likely to occupy, in which he is brought into relation with plant structures. These positions are (1) in the collection and identification of crude material for the manufacture of medicines, (2) in the wholesale and retail trade of partially prepared plant material, such as rhubarb and mustard, and (3) in the examination of foods and condiments.

It does not require more words to convince one that the profession of the pharmacist touches at many points on the science of botany. We may pause here, however, to look a little more closely at the range of the science that is of practical utility. This brings in the second heading named above—viz., How much botany does the pharmacist need?

The whole range of botanical science may be divided into systematic botany, structural botany and physiological botany. What part of this great field will the pharmacist find of use in his profession? The manufacturer certainly needs to understand systematic botany, so that he may be able to identify his crude material as the particular plant that he wishes to use. But he receives much material that is partially prepared and incapable of identification by the ordinary method of analysis of plants by external features. In such cases he must study the internal structure of this material, study it often microscopically. This means that he must understand not only systematic, but structural botany. And he must understand the whole range of the plant kingdom, for his material comes from as low in the series of plants as the ergot and Iceland moss, and rises through the ferns and Lycopodium to the highest flowering plants.

But not only is systematic and structural botany a necessity to the manufacturer, but physiological botany can hardly be dispensed with, especially if one wishes to attempt new methods and new preparations. Physiology teaches one how, for instance, the fatty and ethereal oils come into existence. In what plants and what tissues they are to be found, and at what age of the plant they are greatest in quantity.

The botany needed by the analyst of medicinal and food preparations is pre-eminently structural. Since the preparations come from all parts of the plants, from root, stem, leaf, flower, seed and fruit, the pharmacist, in order to be able to determine the composition of these

preparations, must know the structure of all parts of plants, whether he has to deal with the organs in their whole condition or with the same organs ground to powder. Moreover, in order to do this kind of work intelligently, the analyst should understand systematic botany; for his material comes from all groups of the plant kingdom. Physiological botany is in this kind of work less of a necessity than in manufacturing, yet the pharmacist who knows not only how to recognize what he sees, but knows also how the substance came to be, knows the process by which the plant manufactured it, will do better work, with better satisfaction to himself and to others, than the man whose thoughts travel no farther than to identify the object which he sees. The one works as the skilled archaeologist, who, when a ruin is uncovered, not only recognizes the utensils and fragments, but from the pieces is able to construct the whole, while at the same time he knows the period to which they belong and the rank of the family that possessed them. The other works as the laborer, whose spade turns the earth and who knows little more than to separate the valuable remnants from the inclosing dirt.

If, then, we may assume that at least two departments of botany are a necessity to the pharmacist who attempts to analyze crude plant material and foods, and that the third, or physiology, is more or less desirable according to the particular direction of the work involved, we may now go a step farther and inquire by what means the untaught are to obtain this knowledge.
